Calculation of Background Concentrations for Flare Modeling

To account for regional background concentrations for modeling of the flare, Tennessee calculated the most recent three years (2019-2021) of the hourly varying "season-by-hours-of-day" background dataset using hourly ambient SO_2 concentrations measured by the monitor located at Mammoth Cave National Park in Kentucky (AQS ID 21-061-0501). Hourly ambient SO_2 concentrations[1] were tabulated from the raw data, and for each month and year, the maximum concentration for each hour was extracted from the raw data (**Attachments I4, I5, and I6**). Seasonal hourly values were calculated for each year using the highest value for each hour of the day for winter (December, January, and February), spring (March, April, and May), summer (June, July, and August), and fall (September, October, and November) as the maximum value for each hour, and the annual values were averaged to determine the "season-by-hours-of-day" as the average of 2019, 2020, and 2021 (**Attachment I7**).

During review of the calculations, an error was discovered in the modeling file, in which the values for 2021 were not included in multiple hours. The background concentrations were recalculated and compared to the modeled values (**Attachment I8**), and the modeled background concentrations varied from a minimum of minus 0.28 ppb (monitor background concentration minus modeled value) to a maximum of 1.03 ppb (i. e., for the worst-case error, the monitored background was 1.03 ppb higher than the modeled value). Tennessee reviewed the flare modeling and determined that the error does not affect the validity of the model results, because an increase in the modeled impact of 1.03 ppb does not affect the outcome of the flare modeling described in Attachment I1: the area continued to attain the standard when flare emissions were below the proposed limit (see **Table I3-1** for corrected model results).

Table I3-1: Corrected Model Results (Updated Table I1-1)

Year	Number of 30-day Rolling Averages > 16.28 lb/hr	Number of Hours > 16.28 lb/hr	Modeled Impact (ppb)	Corrected Modeled Impact (ppb)[2]
2017	30	320	67.12	68.15
2018	30	72	75.14	76.17
2019	0	31	67.12	68.15
2020	0	88	67.12	68.15
2021	0	55	67.12	68.15
2022	37	226	80.29	81.32
2023	30	72	80.93	81.96

[1] Hours in the spreadsheets included in this attachment are "hour beginning", meaning that from midnight to 1:00 AM is hour zero, 1:00 AM to 2:00 AM is hour one, etc.

[2] The actual modeled concentrations could be lower, because the worst-case correction was applied to all results, regardless of season or hour of the day.

SIP Permit 082237
(Eastman Chemical Company)

STATE OF TENNESSEE
AIR POLLUTION CONTROL BOARD
DEPARTMENT OF ENVIRONMENT AND CONSERVATION
NASHVILLE, TENNESSEE

PERMIT TO OPERATE AIR CONTAMINANT SOURCE(S)

Permit Number: 082237

Facility (Permittee): Eastman Chemical Company

Facility ID: 82-0003

Facility Address: 200 South Wilcox Drive, Kingsport
Sullivan County

Facility Classification: Title V

Federal Requirements: SIP

Facility Description: Emission Sources Identified in Section I of this Permit

Operating Permit 082237, consisting of 16 pages, is hereby issued June 11, 2025, pursuant to the Tennessee Air Quality Act and by the Technical Secretary, Tennessee Air Pollution Control Board, Department of Environment and Conservation. The holder of this permit shall comply with the conditions contained in this permit as well as all applicable provisions of the Tennessee Air Pollution Control Regulations (TAPCR).

Michelle W. Owenby
Technical Secretary
Tennessee Air Pollution Control Board

No Authority is Granted by this Permit to Operate, Construct, or Maintain any Installation in Violation of any Law, Statute, Code, Ordinance, Rule, or Regulation of the State of Tennessee or any of its Political Subdivisions.

Section I – Sources Included in this Operating Permit

FACILITY DESCRIPTION			
Source Number	**Source Description**	**Status**	**Control Device/Equipment**
01	Boilers 18-24 (MSOP-02, PES B-83-1)	Active	Dry Sorbent Injection (Boilers 23 and 24)
131	Boilers 30-31 (MSOP-26, PES B-325-1)	Active	Spray Dryer Absorber and ESP (Boiler 30), Spray Dryer Absorber and Baghouse (Boiler 31)
168	Tail Gas Incinerator (MSOP-17, PES B-334-1)	Active	N/A
171	Cold and Warm Flares (MSOP-17, PES B-351-5)	Active	N/A
224	Organic Acids & Anhydrides Manufacturing, Vents B, C, E, I, and K (MSOP-23, PES B-55-1)	Active	N/A
282	Solid/Liquid Chemical Waste Incinerators (MSOP-32, PES B-248-1)	Active	Rod Scrubber
283	Liquid Chemical Waste Incinerator (MSOP-32, PES B-248-2)	Active	Rod Scrubber

Section II – Permit Record

Permit Type	Description of Permit Action	Issue Date
Initial	Initial SIP permit issuance	June 11, 2025

Section III - General Permit Conditions

G1. Reserved.

G2. General Recordkeeping Requirements

The information contained in logs, records, and submittals required by this permit shall be kept at the facility's address, unless otherwise noted, and provided to the Technical Secretary or a Division representative upon request. Computer-generated logs are acceptable. Compliance is assured by retaining the logs, records, and submittals specified in this permit for a period of not less than five years at the facility's address.

TAPCR 1200-03-10-.02(2)(a)

G3. Submittals

Unless otherwise specified within this permit, the permittee shall submit, preferably via email and in Adobe Portable Document format (PDF), all applicable plans, checklists, certifications, notifications, test protocols, reports, and applications to the attention of the following Division Programs at the email addresses indicated in the table below:

Permitting Program	Compliance Validation Program	Field Services Program
• Notifications • Startup certifications • Applications • NSPS reports • MACT/GACT/NESHAP reports • Emission statements • Construction permit extension requests	• Test protocols • Emission test reports • Visible emission evaluation reports	• Semiannual reports • Annual compliance certifications/status reports
Division of Air Pollution Control Davy Crockett Tower, 7th Floor 500 James Robertson Parkway Nashville, TN 37243 Air.Pollution.Control@tn.gov		

The permittee shall submit the information identified above as requested in this permit. In lieu of submitting this information to the email addresses above, the permittee may submit the information to the attention of the respective Division Programs at the mailing addresses listed above.

TAPCR 1200-03-09-.03(8)

G4. Contingency Measures

Upon notification by the Technical Secretary that a reference monitor for the area has registered four validated ambient SO_2 concentrations in excess of the standard (75 parts per billion, 99th percentile of daily maximum one-hour average concentrations determined in accordance with 40 CFR 50, Appendix T) during any maintenance period approved pursuant to CAA §§175a(a) and (b), the permittee shall undertake a full system audit of all emissions units subject to control under this plan. The permittee must submit a written system audit report within 30 days of the notification. The system audit report must detail the operating parameters of all emissions units, including modeled emission units that were excluded from the SIP, for four 10-day periods up to and including the date upon which the reference monitor registered each exceedance, together with recommended provisional SO_2 emission control strategies for each affected unit and evidence that these control strategies have been deployed, as appropriate. Upon consultation with the Technical Secretary, the permittee shall develop and implement operational changes as necessary to prevent future monitored violations of the standard. These changes may include fuel switching, physical or operational reduction of production capacity, or other changes as appropriate. If a permit modification is deemed necessary, any changes to existing permit conditions shall follow the applicable procedures of TAPCR 1200-03-09. If an emission source is found to be noncompliant with a SIP emission limit, the Technical Secretary will, in addition to conducting enforcement proceedings to bring the source into compliance with its SIP limit, determine whether additional limits must be added to the SIP to meet the requirements of section 172(c)(9) of the Clean Air Act.

TAPCR 1200-03-09-.03(8)

Section IV - Source Specific Permit Conditions

Source Number	Source Description
01	Boilers 18-24 (MSOP-02, PES B-83-1)
131	Boilers 30-31 (MSOP-26, PES B-325-1)

S1-1. Emission Limitation(s)

On and after September 1, 2023, sulfur dioxide (SO_2) emitted from this source shall not exceed 1,248 lb/hr (combined limit for all boilers, 30-day rolling average).

TAPCR 1200-03-09-.03(8), 40 CFR §§51.110 – 51.112, Condition 1 of SIP permit 080222.

Compliance Method: Compliance with this condition shall be assured as specified in Appendix 1.

S1-2. Operation of Dry Sorbent Injection

On and after March 1, 2023, the permittee shall operate and maintain a dry sorbent injection (DSI) system to reduce SO_2 emissions from B-83 Boilers 23 and 24. The permittee shall operate, maintain and repair the control device as required to maintain and assure compliance with the specified emission limits. All periods of nonoperation of the DSI and records of all repair and maintenance activities shall be recorded in a suitable permanent form and kept available for inspection by the Technical Secretary or an authorized representative. These records must be retained for a period of not less than five years. Periods of nonoperation of the DSI and the date each maintenance and repair activity began shall be entered in the log no later than seven days following the start of the period of nonoperation or maintenance and repair maintenance activity, and the completion date shall be entered in the log no later than seven days after activity completion.

TAPCR 1200-03-09-.03(8), 40 CFR §§51.110 – 51.112, Condition 2 of SIP permit 080222.

S1-3. Periodic Reporting

On and after the issue date of this permit, the permittee shall submit reports of any monitoring or recordkeeping required by this permit with the semiannual reports required by the applicable Title V Operating Permit. Periodic reports shall include the following information:

A. 30-day average SO_2 emission rate for each day in the reporting period. A summary report[1] of this data is acceptable provided there is sufficient information to enable the Technical Secretary to evaluate compliance.

B. All instances of deviations from these permit requirements must be clearly identified in the reports. Deviation reports shall include a description of the deviation; the duration of the event; the explanation or probable cause; and identification of corrective actions or preventative measures undertaken to correct the deviation.

C. The owner or operator shall submit CEMS downtime reports in accordance with Rule 1200-03-10-.02(2). If there are no excess emissions or CEMS downtime during the reporting period, the owner or operator shall submit a report to that effect.

This report must be certified by a responsible official consistent with TAPCR 1200-03-09-.02(11)(d)4.

[1] For all emissions reporting requirements identified in this permit, the minimum requirements for summary reporting are the highest measured emission rate, the date on which the measurement occurred, and either a report of all deviations or a statement that no deviations occurred during the reporting period. For reports of parametric monitoring, the minimum requirements for summary reporting are the highest or lowest measured value, as applicable, the date on which the measurement occurred, and either a report of all deviations or a statement that no deviations occurred during the reporting period.

TAPCR 1200-03-09-.03(8) and 1200-03-10-.02(1)(a)

Source Number	Source Description
168	Tail Gas Incinerator (MSOP-17, PES B-334-1)

S2-1. Emission Limitation(s)

On and after September 1, 2023, SO_2 emitted from this source shall not exceed 21.8 lb/hr (24-hour block average).

TAPCR 1200-03-09-.03(8), 40 CFR §§51.110 – 51.112, Condition 1 of SIP permit 080222.

Compliance Method: Compliance with this condition shall be assured as specified in Appendix 2.

S2-2. Periodic Reporting

On and after the issue date of this permit, the permittee shall submit reports of any monitoring or recordkeeping required by this permit with the semiannual reports required by the applicable Title V Operating Permit. Periodic reports shall include the following information:

A. 24-hour average SO_2 emission rate for each day in the reporting period. A summary report of this data is acceptable provided there is sufficient information to enable the Technical Secretary to evaluate compliance.

B. All instances of deviations from these permit requirements must be clearly identified in the reports. Deviation reports shall include a description of the deviation; the duration of the event; the explanation or probable cause; and identification of corrective actions or preventative measures undertaken to correct the deviation.

C. The owner or operator shall submit CEMS downtime reports in accordance with Rule 1200-03-10-.02(2). If there are no excess emissions or CEMS downtime during the reporting period, the owner or operator shall submit a report to that effect.

This report must be certified by a responsible official consistent with TAPCR 1200-03-09-.02(11)(d)4.

TAPCR 1200-03-09-.03(8) and 1200-03-10-.02(1)(a)

Source Number	Source Description
171	Cold Flare and Warm Flare for South Production Areas (MSOP-17, PES B-351-5)

S3-1. Emission Limitation(s)

A. On and after *****30 days following permit issue date****, SO_2 emitted from this source shall not exceed 16.28 lb/hr (30-day rolling average).

B. On and after *****12 months following permit issue date****, SO_2 emitted from this source shall not exceed 48 tons during any period of 12 consecutive months.

TAPCR 1200-03-09-.03(8), 40 CFR §§51.110 – 51.112

Compliance Method: Compliance with this condition shall be assured as follows:

A. Compliance with the hourly emission limit shall be assured as specified in Appendix 3 of this permit.

B. The permittee shall calculate actual emissions of sulfur dioxide emitted during each period of 12 consecutive months and maintain records of the emissions in the format shown in Appendix 4 of this permit.

TAPCR 1200-03-10-.02(1)(a), 1200-03-10-.02(2)(a)

S3-2. Periodic Reporting

On and after the issue date of this permit, the permittee shall submit reports of any monitoring or recordkeeping required by this permit with the semiannual reports required by the applicable Title V Operating Permit. Periodic reports shall include the following information:

A. 30-day average SO_2 emission rate for each day in the reporting period. A summary report of this data is acceptable provided there is sufficient information to enable the Technical Secretary to evaluate compliance.

B. 12-month rolling total SO_2 emissions for each month in the reporting period. A summary report of this data is acceptable provided there is sufficient information to enable the Technical Secretary to evaluate compliance.

C. All instances of deviations from these permit requirements must be clearly identified in the reports. Deviation reports shall include a description of the deviation; the duration of the event; the explanation or probable cause; and identification of corrective actions or preventative measures undertaken to correct the deviation.

This report must be certified by a responsible official consistent with TAPCR 1200-03-09-.02(11)(d)4.

TAPCR 1200-03-09-.03(8) and 1200-03-10-.02(1)(a)

S3-3. This emission limits and other requirements established by this permit supersede the limits previously established in SIP permit 080222.

TAPCR 1200-03-09-.03(8)

Source Number	Source Description
224	Organic Acids & Anhydrides Manufacturing, Vents B, C, E, I, and K (MSOP-23, PES B-55-1)

S4-1. Emission Limitation(s)

On and after March 8, 2026, SO_2 emitted from this source shall not exceed 6.74 lb/hr (one-hour average).

TAPCR 1200-03-09-.03(8), 40 CFR §§51.110 – 51.112

Compliance Method: Compliance with this condition shall be assured as follows:

A. The permittee shall conduct or have conducted performance tests to determine the amount of sulfur dioxide emitted from this source. The initial performance test shall be completed no later than June 6, 2026. For Vent E (not in service as of the issue date of this permit), an initial performance test shall be conducted no later than 180 days following any restart of the associated process. The permittee shall provide, at no expense to the Technical Secretary:

a) Sampling ports adequate for test methods applicable to such facility.
b) Safe sampling platform(s)
c) Safe access to sampling platform(s)
d) Utilities for sampling and testing equipment

TAPCR 1200-03-10-.01

B. For Vent B, the performance test shall consist of at least three test runs. For each test run, reference method test data shall be collected every 15 minutes over the entire batch cycle. The test data shall be used to generate an emissions curve that is representative of the SO_2 emission rate in lb/hr over the duration of the batch cycle.

C. For Vents C, E, I, and K, each performance test shall consist of three separate one-hour runs using the applicable test method. For the purpose of determining compliance with the applicable standard, the arithmetic means of the results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of a forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances beyond the owner or operator's control, compliance may, upon the Technical Secretary's approval, be determined using the arithmetic mean of the results of the two other runs.

TAPCR 1200-03-10-.01(1)(a), (b), and (c)

D. The permittee shall notify the Technical Secretary in writing of their intention to conduct the performance test at least 30 days before the performance test is initially scheduled to begin to allow the Technical Secretary to have an observer(s) present during the test.

In the event the permittee is unable to conduct the performance test on the date specified in the notification requirement in this condition, the permittee must notify the Technical Secretary as soon as practical prior to the scheduled performance test date and specify the date when the performance test is rescheduled. This notification of delay in conducting the performance test shall not relieve the permittee of legal responsibility for compliance with any other applicable provisions of any other applicable Federal, State, or local requirement, nor will it prevent the Technical Secretary from implementing or enforcing the terms of this permit.

TAPCR 1200-03-10-.01 and 1200-03-10-.02(c)

E. The permittee shall develop and submit a site-specific test plan for approval to the Technical Secretary at least 30 calendar days before the performance test is scheduled to take place, simultaneously with the notification of intent to conduct a performance test. The site-specific test plan shall include a test program summary, the test schedule, data quality objectives (i. e., the pretest expectations of precision, accuracy, and completeness of data), and an internal and external quality assurance (QA) program.

TAPCR 1200-03-10-.01

F. The performance test shall be conducted, and data reduced in accordance with the methods and procedures specified in 40 CFR part 60 Appendix A.

TAPCR 1200-03-10-.01

G. The permittee shall report the results of the performance test to the Technical Secretary within 60 days following the completion of the performance test. The report shall include the relevant process data (material input rate, production rate, etc., as appropriate) recorded during the test.

TAPCR 1200-03-10-.01

H. Upon submittal of the test report, the permittee shall calculate hourly emissions from the performance test results and batch data using the plant's distributed control system.

TAPCR 1200-03-10-.01

I. The permittee shall conduct subsequent performance tests no later than 180 days following any process change that would increase emissions from any vent[2]. If there are no process changes that would increase SO_2 emissions, subsequent performance tests shall be conducted no later than 60 calendar months after the previous test.

TAPCR 1200-03-10-.01

S4-2. Periodic Reporting

On and after August 5, 2026, the permittee shall submit reports of any monitoring or recordkeeping required by this permit with the semiannual reports required by the applicable Title V Operating Permit. Periodic reports shall include the following information:

A. SO_2 emission rate (lb/hr) for each day of the reporting period. A summary report of this data is acceptable provided there is sufficient information to enable the Technical Secretary to evaluate compliance.

B. A description of any process changes that would increase SO_2 emissions, or a statement that there were no process changes during the reporting period that would increase SO_2 emissions from the source.

C. All instances of deviations from these permit requirements must be clearly identified in the reports. Deviation reports shall include a description of the deviation; the duration of the event; the explanation or probable cause; and identification of corrective actions or preventative measures undertaken to correct the deviation.

This report must be certified by a responsible official consistent with TAPCR 1200-03-09-.02(11)(d)4.

TAPCR 1200-03-09-.03(8) and 1200-03-10-.02(1)(a)

Source Number	Source Description
282	Solid/Liquid Chemical Waste Incinerators (MSOP-32, PES B-248-1)

S5-1. Emission Limitation(s)

On and after September 1, 2023, SO_2 emitted from this source shall not exceed 15.2 lb/hr (combined limit for both rotary kilns, 30-day rolling average).

TAPCR 1200-03-09-.03(8), 40 CFR §§51.110 – 51.112, Condition 1 of SIP permit 080222.

Compliance Method: Compliance with this condition shall be assured as specified in Appendix 5.

S5-2. Periodic Reporting

On and after the issue date of this permit, the permittee shall submit reports of any monitoring or recordkeeping required by this permit with the semiannual reports required by the applicable Title V Operating Permit. Periodic reports shall include the following information:

[2] If a process change increases emissions from the batch reactors, then all vents must be tested to ensure that SO_2 emissions do not increase in other areas of the process. For other changes, Eastman must specify which vents will be tested in the site-specific test plan.

A. 30-day average SO_2 emission rate for each day in the reporting period. A summary report of this data is acceptable provided there is sufficient information to enable the Technical Secretary to evaluate compliance.

B. All instances of deviations from these permit requirements must be clearly identified in the reports. Deviation reports shall include a description of the deviation; the duration of the event; the explanation or probable cause; and identification of corrective actions or preventative measures undertaken to correct the deviation.

This report must be certified by a responsible official consistent with TAPCR 1200-03-09-.02(11)(d)4.

TAPCR 1200-03-09-.03(8) and 1200-03-10-.02(1)(a)

Source Number	Source Description
283	Liquid Chemical Waste Incinerator (MSOP-32, PES B-248-2)

S6-1. Emission Limitation(s)

On and after September 1, 2023, SO_2 emitted from this source shall not exceed 2.0 lb/hr (30-day rolling average).

TAPCR 1200-03-09-.03(8), 40 CFR §§51.110 – 51.112, Condition 1 of SIP permit 080222

Compliance Method: Compliance with this condition shall be assured as specified in Appendix 5.

S6-2. Periodic Reporting

On and after the issue date of this permit, the permittee shall submit reports of any monitoring or recordkeeping required by this permit with the semiannual reports required by the applicable Title V Operating Permit. Periodic reports shall include the following information:

A. 30-day average SO_2 emission rate for each day in the reporting period. A summary report of this data is acceptable provided there is sufficient information to enable the Technical Secretary to evaluate compliance.

B. All instances of deviations from these permit requirements must be clearly identified in the reports. Deviation reports shall include a description of the deviation; the duration of the event; the explanation or probable cause; and identification of corrective actions or preventative measures undertaken to correct the deviation.

This report must be certified by a responsible official consistent with TAPCR 1200-03-09-.02(11)(d)4.

TAPCR 1200-03-09-.03(8) and 1200-03-10-.02(1)(a)

(end of conditions)

Appendix 1: B-83 and B-325 SO_2 Monitoring

Stack or Flow Diagram Points	PES B-83-1, Boilers 18 through 24 PES B-325-1, Boilers 30 and 31
Pollutants	SO_2 (combined total emissions for all boilers)
Description of Monitoring Protocol	The source owner or operator shall install, maintain, operate, and submit reports of sulfur dioxide emissions from continuous in-stack monitoring systems for sulfur dioxide (SO_2) and either oxygen (O_2) or carbon dioxide as the diluent gas. The sensors of these monitoring systems shall be located in representative areas of the effluent gas stream of the boiler. Electronic signal combining systems shall be installed to convert the output of the pollutant monitors into units of the applicable emission standards. The in-stack sulfur dioxide monitoring systems shall meet all the requirements of 40 CFR Part 60 Appendix B Performance Specification 2 or 40 CFR Part 75 Appendix A. SO_2 emission rates in lb/hr shall be calculated as follows: **Boilers 23-24 and 30-31**: The source owner or operator shall install, certify, operate, and maintain a SO_2 continuous emission monitoring system and a flow monitoring system with an automated data acquisition and handling system for measuring and recording SO_2 concentration (in parts per million), volumetric gas flow (in standard cubic feet per hour), and SO_2 mass emissions (in lb/hr) discharged to the atmosphere. The in-stack flow monitoring systems shall meet all the requirements of 40 CFR Part 60 Appendix B Performance Specification 6 or 40 CFR Part 75 Appendix A. **Boilers 18-22:** 40 CFR 60 Appendix A, Method 19 shall be used to determine hourly average emissions of sulfur dioxide expressed as pounds per million Btu heat input. Hourly average emissions of sulfur dioxide expressed as pounds per hour shall be determined by multiplying each hourly average sulfur dioxide emission rate expressed as pounds per million Btu by the respective hourly average heat input. The heat input for Boilers 18-22 will be computed by determining the energy rise of the steam across the individual boiler. The energy rise will be calculated as the difference in the energy of the output steam and the energy of the feedwater input. Boiler outlet pressure, temperature and flow along with the inlet feedwater temperature and flow will be used to determine the total energy change across the boiler. The energy of the outlet steam will be approximated by multiplying the boiler outlet steam flow by steam enthalpy. Enthalpy for the outlet steam conditions shall be determined using the ASME International Steam Tables for Industrial Use at the steam outlet pressure and temperature. Boiler outlet energy will be adjusted for an assumed boiler efficiency of 85%. The feedwater energy will be calculated by multiplying the inlet feedwater flow by the inlet feedwater enthalpy. The feedwater enthalpy will be determined using the enthalpy of saturated water from the ASME Steam Tables at the boiler economizer inlet feedwater temperature. The boiler heat will be determined by subtracting the boiler inlet energy form the boiler outlet energy. This heat input will be transmitted to the SO_2 CEMS data acquisition and control system (DAHS) to use for computation of the sulfur dioxide mass emission rate in pounds per hour. Missing emissions data shall be addressed as follows: Data is considered missing if there are fewer than two valid 15-minute averages during the hour. Data shall be substituted for the duration of each missing data period by using the higher value of: 1) the last valid hourly emission rate before, or 2) the first valid hourly emission rate after, the period of missing data.

Calculation of 30-day rolling average	Compliance will be determined on a 30 boiler operating day rolling average basis. All 30-day rolling averages shall be calculated as specified in 40 CFR §63.10021(b) and Equation 8: $$Boiler\ operating\ day\ average = \frac{\sum_{i=1}^{n} Her_i}{n}\ (Eq.\ 8)$$ Where Her_i is the hourly emissions rate for hour i (combined total emissions for all boilers) and n is the number of hourly emissions rate values collected over 30 boiler operating days. **Note**: "Boiler operating day" means a 24-hour period that begins at midnight and ends the following midnight during which any fuel is combusted at any time in any of the boilers. It is not necessary for the fuel to be combusted the entire 24-hour period.
Operational requirements for Sulfur Dioxide (SO_2) Monitoring Systems	For each boiler to demonstrate continual compliance with the applicable sulfur dioxide emissions limitations, the in-stack sulfur dioxide monitoring systems shall be fully operational for at least 95% of the operational time of the monitored boiler during any calendar quarter. An operational availability of less than this amount may be considered the basis for declaring the source to be in noncompliance with the applicable monitoring requirements, unless the reasons for the failure to maintain this level of operational availability are accepted by this division as being legitimate malfunctions of the instruments.

Appendix 2: PES B-334-1 SO_2 Monitoring

Stack or Flow Diagram Points	Tail Gas Incinerator (Vent B)
Description of Monitoring Protocol	An extractive sampling system or equivalent monitor shall continuously measure the H_2S composition in the Shell Claus Off-gas Treatment (SCOT) process overhead stream entering the Tail Gas Incinerator. The gas flow rate into the incinerator shall be continuously monitored, and the distributed control system shall use the H_2S composition and the flow rate (differential pressure or equivalent device) to calculate the SO_2 emission rate in lb/hr for a 24-hour block average. Process operational time does not include periods of Sulfur Recovery Plant outages. Monitoring data recorded during periods of monitoring system breakdown, repairs, calibration checks, zero and span adjustments, shall not be included in the data averages. In the event of an analyzer outage or Claus unit upset requiring direct venting to the incinerator, engineering evaluation and calculations will determine the lb/hr SO_2 emissions using actual operational data from the Claus and SCOT units.
Equipment and Installation	Hydrogen sulfide analyzer and flow meter located at the inlet to the tail gas incinerator.
Measurement Frequency	Continuous (at least once every 15 minutes)
Minimum Data Availability	The SO_2 monitoring system shall be fully operational for at least 95% of the operational time of the incinerator during each semiannual reporting period.
QA/QC Practices	Calibrate and maintain all monitoring equipment in accordance with manufacturer's specifications.

Appendix 3: PES B-351-5 SO_2 Monitoring

Stack or Flow Diagram Points	Cold Flare (Vent B) and Warm Flare (Vent C)
Description of Monitoring Protocol	Excess gas which cannot be safely utilized in the Coal Gasification Process is relieved to one of two vent header systems, where that gas is then routed to one of two corresponding natural gas assisted flares for combustion, i.e., Cold Flare and Warm Flare. Hourly SO_2 emissions from the flares are calculated during these events by using the following protocol: 1. Control valve operating positions (percentage valve open) and control valve upstream pressures are used to calculate volumetric flow rate of the gas stream routed to the flare(s). 2. Known plant gas stream compositions are used to calculate sulfur content of the gas stream routed to the flare(s). 3. Total conversion (100%) of sulfur in the gas stream routed to the flare(s) to SO_2 after combustion is used to determine final SO_2 emissions from the flare(s).
Equipment and Installation	Control valves and pressure transmitters located upstream of each flare.
Measurement Frequency	Continuous (at least once every 15 minutes)
Calculation of 30-day rolling average	Compliance will be determined on a 30 operating day rolling average basis. All 30-day rolling averages shall be calculated as specified in the following equation: $$30\ operating\ day\ average = \frac{\sum_{i=1}^{n} Her_i}{n}$$ Where Her_i is the hourly emissions rate for hour *i* (combined total emissions for cold and warm flares) and *n* is the number of hourly emissions rate values (including periods with no SO_2 emissions) collected over 30 operating days. "Operating day" means a 24-hour period that begins at midnight and ends the following midnight during which any synthesis gas is produced by the gasifiers. It is not necessary for synthesis gas to be produced during the entire 24-hour period.
Minimum Data Availability	The SO_2 monitoring system shall be fully operational for at least 95% of the operational time of the incinerator during each semiannual reporting period.
QA/QC Practices	**Valve operating positions**: An annual field review will be completed for each control valve. Each flare valve will be verified either during process-related opening or by conducting a manual valve calibration check. Either (1) the process-related verification is completed by verifying the DCS-indicated percent open matches the field-observed percent open; or (2) a manual verification is completed by isolating the selected valve using manual valves as available (the isolated control valve will be given a DCS command to open to a set percentage, and a field operator will visually verify that the correct valve position is achieved). **Valve upstream pressures**: the pressure transmitters are used as input parameters to critical process control loops. Normal and ongoing operations, in conjunction with operators' experience, will ensure proper operation of the pressure transmitters. Any abnormal function in these devices would require corrective action as part of normal plant operations.

Appendix 5: PES B-248-1 and 248-2 SO_2 Monitoring

Stack or Flow Diagram Points	PES B-248-1: Vents D (Rotary Kiln #1) and E (Rotary Kiln #2) PES B-248-2: Vent A (Liquid Chemical Incinerator)
Pollutants	SO_2
Control Equipment	SO_2 emissions from the solid/liquid chemical waste incinerators (82-0003-282, PES-B-248-1) and liquid chemical waste incinerator (82-0003-283, PES B-248-2) shall be continuously controlled by wet scrubbers (Croll-Reynolds Clean Air Technologies multi-rod scrubber for each emission point).
Description of Monitoring Protocol	1. Continuous Monitoring of Rod Scrubber Underflow pH A pH sensor and transmitter are installed in either the rod scrubber underflow line or the sump (which receives the rod scrubber underflow) before any caustic or additional water is added in the recycle loop. The distributed control system (DCS) will receive pH values from the transmitter, and a data archival system shall record the pH reading four or more times equally spaced over the hour. The permittee shall operate and maintain continuous monitoring systems (CMS) for scrubbing liquid pH and shall operate all CMS to document compliance with the applicable operating parameter limits under this section as follows: (a) The permittee shall install and operate the CMS in compliance with the manufacturer's written specifications or recommendations for installation, operation, and calibration. (b) The CMS must sample the regulated parameter without interruption and evaluate the detector response at least once each 15 seconds, and compute and record the average values at least every 60 seconds. (c) The span of the CMS detector shall not be exceeded. (d) Each parameter shall be monitored, and the permittee shall calculate SO_2 emissions from the sulfur feed rate and rod scrubber underflow pH. (e) The permittee shall perform inspections and maintenance of the scrubbers as recommended by the manufacturer. 2. Determination of Sulfur Dioxide Removal Efficiency A series of computer simulations using a commercially available software package (ASPEN®) have been conducted to establish the rod scrubber underflow pH as the key process variable that indicates sulfur dioxide control efficiency. Computer simulations were conducted at varying sulfur loading conditions and correlation curves relating pH and scrubber control efficiency were derived. The correlation curve for the highest sulfur feed modeled was used to develop the relationship programmed into the DCS. The DCS relationship is programmed as a series of straight lines plotted between the following points:

Point	Rod Scrubber Underflow pH	Sulfur Dioxide Removal Efficiency (%)
1	0.00	0.0
2	4.13	0.0
3	4.20	67.2
4	4.42	82.8
5	4.74	90.6
6	5.64	98.1
7	14.00	98.1

	3. Determination of Sulfur Feed Rates Waste stream sulfur concentrations are determined either from process knowledge or from analysis using ASTM method D4239 or equivalent and are entered into the Environmental Management Information System (EMIS). EMIS provides information to the DCS regulating the feed of waste. As waste streams are burned, sulfur feed rates are calculated by the DCS using waste and fuel mass flow sensors that are required by 40 CFR 60 Subpart EEE.
Description of Monitoring Protocol (Continued)	4. Calculation of Stack Gas SO_2 Concentration

	At a minimum of four equally spaced intervals in each hour, the DCS shall calculate the SO_2 emissions concentration using the stack gas flow rate (obtained from sensors required by 40 CFR 63 Subpart EEE), assuming all sulfur from Step #3 is converted to SO_2 and using the SO_2 control efficiency determined in Step #2. The hourly SO_2 concentration and annual emission rate are calculated using the following assumptions and equations: Assumptions: 1. Standard conditions are 68° F and 1 atm; 2. Mole weights: sulfur (S) = 32.06, sulfur dioxide (SO_2) = 64.06; 3. SO_2 removal is based on the relationship established in Step #2; 4. All sulfur feeds react completely to SO_2; 5. Density of SO_2 gas at standard conditions = 0.1662 lb/ft^3. **SO_2 emission rate (lb/hr)** = sulfur feed rate (lb/hr) x (64.06 lb SO_2/32.06 lb S) x (1-SO_2 removal) 30-day rolling average SO_2 emission rates will be calculated from hourly emission rates.
Averaging	One-hour averages shall be calculated from four or more equally spaced data averages over each one-hour period, except during periods of monitoring system breakdown, monitoring system repairs, and periods of non-operation of the source. During these periods, a valid one-hour average shall consist of at least two 15-minute averages. Data collected during periods of monitoring system breakdown, monitoring system repairs, required quality assurance or control periods, and periods of non-operation of the source shall not be included in the data averages. Compliance will be based on a 30-day rolling average basis. 30-day rolling averages shall be calculated as the arithmetic average of all valid one-hour averages over each 30-day period, beginning on midnight of the first day and ending at midnight on the 30th day. For a given 30-day averaging period, a valid average must include at least 75% percent of the measured values within the averaging period.
Monitoring Downtime Incidents	During periods of pH monitoring downtime, the sulfur dioxide removal efficiency shall be assumed to be zero in Step #2 above. Therefore, and pH monitoring system downtime incidents do not need to be reported as required by 40 CFR §64.9(a)(2)(ii). Any monitoring downtime incidents shall be reported in the semiannual reports, unless, in the case of a feed rate flow sensor, the feed line block valve is closed during the incident.
Minimum Data Availability	The SO_2 monitoring system shall be fully operational for at least 95% of the operational time of the incinerator during each semiannual reporting period.
QA/QC Practices	The pH sensors shall be calibrated once per month.
Reference	Operating Plan in the Title V application dated May 24, 2019, PES B-248-1, pages 25 and 26. Operating Plan in the Title V application dated September 28, 2017, PES B-248-2, pages 12 and 13.

Attachment J2

Regional Haze Permit 066116H
(Eastman Chemical Company)

TENNESSEE AIR POLLUTION CONTROL BOARD
DEPARTMENT OF ENVIRONMENT AND CONSERVATION
NASHVILLE, TENNESSEE 37243-1531

OPERATING PERMIT Issued Pursuant to Tennessee Air Quality Act

Date Issued:	May 9, 2012		Permit Number:
Date Amended:	May 22, 2012	AMENDMENT #1	066116H
Date Expires:	December 31, 2018		

Issued To:	Installation Address:
Eastman Chemical Company Tennessee Operations (MSOP-02)	South Eastman Road Kingsport

Installation Description:	Emission Source Reference No.
Powerhouse B-253-1, Boilers #25-#29	82-0003-00 BART

The holder of this permit shall comply with the conditions contained in this permit as well as all applicable provisions of the Tennessee Air Pollution Control Regulations.

CONDITIONS:

1. In accordance with the requirements of 40 CFR 51.308 (BART), the following emission limitation is established:

   Sulfur dioxide (SO_2) emissions from Boilers 25-29 shall comply with the less stringent of the following limits:

   (a) 0.20 pounds of SO_2 per million British Thermal Units (lb/MMBtu) of heat input; or

   (b) Reduce uncontrolled SO_2 emissions by 92%.

   Compliance with these emission limits shall be determined on a thirty (30) calendar day rolling average basis as the average emission rate, or average SO_2 reduction, from either each boiler individually while combusting coal, or averaged across all of the boilers that are combusting coal.

(conditions continued on next page)

Barry R. Stephens
TECHNICAL SECRETARY

No Authority is Granted by this Permit to Operate, Construct, or Maintain any Installation in Violation of any Law, Statute, Code, Ordinance, Rule, or Regulation of the State of Tennessee or any of its Political Subdivisions.

NON-TRANSFERABLE

POST AT INSTALLATION ADDRESS

2. **Monitoring Requirements**:

Measurement of SO_2 emissions: SO_2 emissions shall be measured through the use of continuous in-stack monitoring for sulfur dioxide, as specified below:

The source owner or operator shall install, maintain, operate, and submit quarterly reports of excess emissions and sulfur dioxide (SO_2) removal efficiency (if applicable) from continuous in-stack monitoring systems for sulfur dioxide (SO_2). The sulfur dioxide monitoring systems shall meet all the requirements of 40 CFR 60 Appendices A and B, or 40 CFR Part 75 Appendices A and F.

Compliance will be determined on a 30 calendar day rolling average basis. Each 30 calendar day average shall be the average of the valid daily averages during the previous thirty (30) calendar days

Operational requirements for Sulfur Dioxide (SO_2) Monitoring Systems: For this fuel burning installation to demonstrate continual compliance with the BART sulfur dioxide emission limitation, each sulfur dioxide monitoring system for boilers #25-#29 shall be fully operational for at least ninety five percent (95%) of the operational time (during which coal is combusted) of the monitored units during each calendar quarter. Operational availability levels of less than these amounts may be considered the basis for declaring the fuel burning installation in noncompliance with the applicable monitoring requirements, unless the reasons for the failure to maintain these levels of operational availability are accepted by the Technical Secretary as being legitimate malfunctions of the instruments. Data recorded during periods of monitoring system breakdown, repairs, calibration checks, and zero and span adjustments shall not be included in the data averages.

Quality Assurance requirements for the Sulfur Dioxide (SO_2) Monitoring Systems: The continuous in-stack sulfur dioxide monitoring systems shall meet all of the requirements of 40 CFR Part 60 Appendix B (Performance Specification 2) and 40 CFR Part 60 Appendix F; or 40 CFR Part 75 Appendices A and B.

Monitoring Plan: Monitoring shall be conducted as specified in an approved site-specific monitoring plan. The monitoring plan must be submitted to the Technical Secretary at least ninety (90) days prior to the startup of the control device.

Recordkeeping: All records required to demonstrate compliance with this condition shall be maintained at the source location and kept available for inspection by the Technical Secretary or his representative. Records shall be maintained for five (5) years.

3. **Compliance Schedule**: Except as otherwise allowed by **Condition 4** of this permit, Eastman Chemical Company shall comply with **Conditions 1 and 2** of this permit no later than April 30, 2017.

4. **Alternative BART Requirements**: In lieu of complying with BART as specified in **Conditions 1, 2, and 3** of this permit, the permittee may choose to implement Alternative BART, as indicated in paragraphs (a) through (f) of this condition. The permittee shall fully implement BART as described in **Conditions 1 and 2** of this permit no later than April 30, 2017, unless Eastman has notified the Technical Secretary and EPA in writing by that date it has elected to implement the Alternative BART.

(a) The permittee shall submit written quarterly progress reports to the Technical Secretary and to the U. S. Environmental Protection Agency (EPA), Region 4 Office. The initial report shall be submitted no later than July 1, 2012. Subsequent reports shall be submitted within one calendar quarter of the previous report.

(i) The reports shall summarize the permittee's acquisition of site-specific meteorological data at the permittee's Kingsport Meadowview site and the modeling results obtained from the data. Only the modeling analyses that are used to determine whether the BART requirements specified in **Conditions 1 and 2** of this permit will be sufficient to attain and maintain the one hour sulfur dioxide NAAQS need be addressed in the submittals. If the permittee concludes that compliance with **Conditions 1 and 2** of this permit are not sufficient to demonstrate attainment and maintenance of the one hour sulfur dioxide NAAQS, the permittee shall include summaries of modeling results showing the predicted ambient impacts of repowering the B-253 Powerhouse to natural gas (and other boilers at the facility, if needed to comply with the one hour sulfur dioxide NAAQS) with the quarterly progress reports.

(ii) If the permittee determines to repower its boilers at its Kingsport, Tennessee facility, the quarterly written report submitted according to the schedule in **Condition 4(a)** shall contact the natural gas supplier for the

area and summarize what the permittee knows regarding the progress on the project to modify the third-party natural gas pipeline to provide sufficient natural gas to the permittee's facility.

(b) The permittee shall submit applications for any construction permit(s) as needed to establish emission limits and other applicable requirements to repower the boilers.

(c) If the permittee determines that Alternative BART is not feasible for this facility, the permittee shall provide written notification to the Technical Secretary and the EPA Region 4 Office no later than April 30, 2017.

(d) The permittee is placed on notice that the issuance of this permit does not excuse it from any other applicable air pollution control requirements that may become applicable as a result of repowering to natural gas.

(e) If the permittee elects to repower its B-253 Powerhouse boilers to natural gas, the permittee shall begin actual construction (as defined in Rule 1200-03-09-.01(4) of the Tennessee Air Pollution Control Regulations) on the conversion no later than April 30, 2017. The permittee shall provide written notice to the Technical Secretary no later than thirty (30) days following the start of actual construction.

(f) If the permittee elects to repower its B-253 Powerhouse boilers to natural gas, the conversion shall be accomplished (or else an unconverted boiler not operated until converted) no later than the earlier of:

(i) The compliance deadline for the one-hour sulfur dioxide NAAQS, or

(ii) December 31, 2018, or the end of the period of the first long term strategy for regional haze as determined by U. S. EPA, whichever is earlier.

5. This permit contains requirements that Eastman Chemical Company must meet in addition to the requirements of Title V Operating Permit 557888.

6. This permit shall remain valid until Title V Operating Permit 557888 is reopened to include the requirements of this permit.

(end of conditions)

Amendment #1: This permit was amended to clarify the requirement to fully implement BART, or to begin actual construction of Alternative BART no later than April 30, 2017.

Attachment J3

PSD Construction Permit 966859
(Eastman Chemical Company)

STATE OF TENNESSEE
AIR POLLUTION CONTROL BOARD
DEPARTMENT OF ENVIRONMENT AND CONSERVATION
NASHVILLE, TENNESSEE 37243-1531

Permit to Construct or Modify an Air Contaminant Source Issued Pursuant to Tennessee Air Quality Act

Date Issued: June 5, 2013

Permit Number:
966859F

Date Expires: December 31, 2018

Issued To:
Eastman Chemical Company

Installation Address:
South Eastman Road
Kingsport

Installation Description:
Boilers 25-29

Emission Source Reference No.
82-0003-01 (PES B-253-1)
PSD, MACT

The holder of this permit shall comply with the conditions contained in this permit as well as all applicable provisions of the Tennessee Air Pollution Control Regulations.

CONDITIONS:

1. The application that was utilized in the preparation of this permit is dated January 16, 2013, and is signed by John G. Perdue, Utilities Division Superintendent for the permitted facility. If this person terminates employment or is reassigned different duties and is no longer the responsible person to represent and bind the facility in environmental permitting affairs, the owner or operator of this air contaminant source shall notify the Technical Secretary of the change. Said notification shall be in writing and submitted within thirty (30) days of the change. The notification shall include the name and title of the new person assigned by the source owner or operator to represent and bind the facility in environmental permitting affairs. All representations, agreement to terms and conditions and covenants made by the former responsible person that were used in the establishment of limiting permit conditions on this permit will continue to be binding on the facility until such time that a revision to this permit is obtained that would change said representations, agreements and covenants.

(conditions continued on next page)

Barry R. Stephens
TECHNICAL SECRETARY

No Authority is Granted by this Permit to Operate, Construct, or Maintain any Installation in Violation of any Law, Statute, Code, Ordinance, Rule, or Regulation of the State of Tennessee or any of its Political Subdivisions.

NON-TRANSFERABLE

POST AT INSTALLATION ADDRESS

2. This emission source consists of an existing fuel burning installation (currently permitted as 82-0003-01, PES B-83-1 and B-253-1). This permit will allow the modification of the PES B-253-1, Boilers 25, 26, 27, 28, and 29 to convert the affected boilers from coal-fired to natural gas-fired operation. This modification is subject to the Prevention of Significant Deterioration (PSD) review provisions of Tennessee Air Pollution Control Regulations (TAPCR) Rule 1200-03-09-.01(4) for significant emissions increases of carbon monoxide and volatile organic compounds (VOC) associated with the proposed project. This source shall operate in accordance with the terms of this permit and the information submitted in the approved permit application. TAPCR 1200-03-09-.01(1)(d) and the application dated January 16, 2013, TAPCR 1200-03-09-.01(4)

3. Approval to construct shall become invalid if construction is not commenced within 18 months after the issue date of this permit, if construction is discontinued for a period of 18 months or more, or if construction is not completed within 18 months of the completion date specified on the construction permit application (December 31, 2018). The Tennessee Air Pollution Control Board may grant an extension to complete construction of the source, provided that adequate justification is presented. An extension shall not exceed 18 months in time. TAPCR 1200-03-09-.01(4)(a)4.

4. The following recordkeeping requirements shall apply to this source:

   (a) For all monthly logs, all data, including all required calculations, must be entered in the log no later than thirty (30) days from the end of the month for which the data is required.

   (b) For all weekly logs, all data, including all required calculations, must be entered in the log no later than fourteen (14) days from the end of the week for which the data is required.

   (c) For all daily logs, all data, including all required calculations, must be entered in the log no later than fourteen (14) days from the end of the day for which the data is required.

   TAPCR 1200-03-10-.02(2)(a)

5. The total heat input for this modified source PES B-253-1 shall not exceed 35.04 trillion British Thermal Units (TBtu) during any period of twelve consecutive months. TAPCR 1200-03-09-.01(1)(d) and the application dated January 16, 2013, TAPCR 1200-03-09-.01(4)

6. On and after the startup date of each modified boiler in this fuel-burning installation, only natural gas shall be used as fuel for each modified boiler. TAPCR 1200-03-09-.01(1)(d) and the application dated January 16, 2013, TAPCR 1200-03-09-.01(4)

7. A monthly log of the heat input, which readily shows compliance with **Condition 5**, must be maintained at the source location and kept available for inspection by the Technical Secretary or his representative. This log shall start upon startup of the first modified boiler and include each successive modified boiler as it commences startup. This log must be retained for a period of not less than five (5) years. TAPCR 1200-03-10-.02(2)(a)

8. On and after the startup date of each modified boiler in this fuel-burning installation, carbon monoxide (CO) emissions from each modified boiler shall not exceed 100 parts per million by dry volume (ppmdv), corrected to 3% oxygen (average of three one-hour test runs). This emission limit shall not apply during periods of startup and shutdown. TAPCR 1200-03-09-.01(4)(j)3.

   Compliance Method: Upon startup of each modified boiler in this fuel-burning installation, the permittee shall comply with the work practice standards (periodic tune-ups) found in Table 3 to 40 CFR 63 Subpart DDDDD (National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers and Process Heaters) applicable to existing boilers operated with a continuous oxygen trim system that maintains an optimum air-to-fuel ratio.

(conditions continued on next page)

9. On and after the startup date of each modified boiler in this fuel-burning installation, volatile organic compounds (VOC) emissions from each modified boiler shall not exceed 10 ppmdv, corrected to 3% oxygen (average of three one-hour test runs). This emission limit shall not apply during periods of startup and shutdown. TAPCR 1200-03-09-.01(4)(j)3.

Compliance Method: Upon startup of each modified boiler in this fuel-burning installation, the permittee shall comply with the work practice standards (periodic tune-ups) found in Table 3 to 40 CFR 63 Subpart DDDDD (National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers and Process Heaters) applicable to existing boilers operated with a continuous oxygen trim system that maintains an optimum air-to-fuel ratio.

10. Particulate matter (TSP) emissions shall not exceed 0.0917 pounds per million British Thermal Units (lb/MMBtu) of heat input (average emission rate for all boilers on B-83-1 and B-253-1). TAPCR 1200-3-19-.05(2)

Compliance Method: Compliance assurance for the particulate matter standard stated in this condition is the use of natural gas. After the shutdown of each boiler for conversion to natural gas combustion, the permittee shall not be required to conduct periodic source testing for particulate matter as required by Condition E3-2 of Title V Operating Permit 557888,.

11. This fuel burning installation shall comply with the applicable provisions of the CAIR NO_X Ozone Season Trading Program. TAPCR 1200-03-27-.11

12. Visible emissions from this source shall not exhibit greater than twenty percent (20%) opacity (six-minute average) except for one six-minute period per one (1) hour of not more than forty (40) percent opacity. Visible emissions from this source shall be determined by EPA Method 9, as published in 40 CFR 60, Appendix A (six-minute average). TAPCR 1200-03-05-.01(1) and 1200-03-05-.03(6)

13. Consistent with the requirements of TAPCR 1200-03-20, due allowance may be made for excess visible emissions that are necessary or unavoidable due to routine startup and shutdown conditions. The permittee shall maintain a continuous, current log of all excess visible emissions showing the time at which such conditions began and ended and that such record shall be available to the Technical Secretary or his representative upon his request. TAPCR 1200-03-05-.02(1)

14. No later than 180 days after initial start-up of each modified boiler in this fuel-burning installation, the owner or operator shall furnish the Technical Secretary a written report of the results of an emissions performance test to demonstrate compliance with the CO and VOC emission limit for Boilers 25, 26, 27, 28, and 29 (see **Conditions 8 and 9** of this permit). The source test shall be conducted and data reduced in accordance with methodology allowed by the Tennessee Division of Air Pollution Control. At least 30 days prior to the actual test date, the Technical Secretary shall be notified of the official test date and shall be in receipt of a test protocol detailing test methods to be used and any operational parameters to be monitored to assure continual compliance.

15. The permittee shall comply with the applicable provisions of 40 CFR 63 Subpart DDDDD (National Emission Standards for Hazardous Air Pollutants for Industrial, Commercial, and Institutional Boilers and Process Heaters). Compliance with this rule is required by January 31, 2016, except as provided in §63.6(i). TAPCR 1200-03-09-.03(8) and 40 CFR 63 Subpart DDDDD

16. Prior to the startup date of each modified boiler in this fuel-burning installation, the existing fuel-burning installation shall comply with the requirements of Title V Operating Permit 557888 (MSOP-02, PES B-253-1) and with subsequent modifications/renewals to that permit. On and after the startup date of this modified source, this construction permit will supersede any previously issued permit(s) for each modified boiler in this fuel-burning installation. TAPCR 1200-03-09-.01(1)(d)

17. The permittee shall apply for a Title V Significant Modification for this fuel-burning installation within 360 days of startup of all five modified boilers. TAPCR 1200-03-09-.02(11)(d)1.(i)(II)

18. This permit shall serve as a temporary operating permit from initial start-up of the modified source to the receipt of a Title V Significant Modification, provided that the conditions of this permit and any applicable emission standards are met. TAPCR 1200-03-09-.02(2)

(conditions continued on next page)

19. The permittee shall certify the start-up date of the modified air contaminant source regulated by this permit by submitting A COPY OF ALL PAGES OF THIS PERMIT, with the information required in A), B), and C) of this condition completed, to the Technical Secretary's representatives listed below. **The permittee shall comply with this condition and submit one copy of this form for each boiler modified by this permit (PES B-253-1, Boilers 25, 26, 27, 28, and 29).**

A) Boiler ID: _____

B) DATE OF START-UP: _____/____/_____
month day year

C) Anticipated operating rate: ____ percent of maximum rated capacity

For the purpose of complying with this condition, "start-up" of the air contaminant source shall be the date of the setting in operation of the source for the production of product for sale or use as raw materials or steam or heat production.

The undersigned represents that he/she has the full authority to represent and bind the permittee in environmental permitting affairs. The undersigned further represents that the above provided information is true to the best of his/her knowledge and belief.

Signature		Date
Signer's name (type or print)	Title	Phone (with area code)

Note: This certification is not an application for an operating permit. At a minimum, the appropriate application form(s) must be submitted requesting an operating permit. The application must be submitted in accordance with the requirements of this permit.

The completed certification shall be delivered to the East Tennessee Permit Program, Compliance Validation Program, and the Johnson City Environmental Field Office at the addresses listed below, no later than thirty (30) days after the air contaminant source is started-up.

Compliance Validation Program
Division of Air Pollution Control
9th Floor, L & C Annex

TAPCR 1200-03-09-.02(3)(b)

(end of conditions)

The permit application gives the location of this source as 4042367 N UTM Vertical and 362547 E UTM Horizontal.

Attachment J4

Title V Operating Permit 574994
(Primester)

STATE OF TENNESSEE
AIR POLLUTION CONTROL BOARD
DEPARTMENT OF ENVIRONMENT AND CONSERVATION
NASHVILLE, TENNESSEE 37243

ADMINISTRATIVE AMENDMENT #1 TO
OPERATING PERMIT (TITLE V) Issued Pursuant to Tennessee Air Quality Act

This permit fulfills the requirements of Title V of the Federal Clean Air Act (42 U.S.C. 7661a-7661e) and the federal regulations promulgated thereunder at 40 CFR Part 70. (FR Vol. 57, No. 140, Tuesday, July 21, 1992 p.32295-32312). This permit is issued in accordance with the provisions of Tennessee Air Pollution Control Regulations (TAPCR) 1200-03-09-.02(11). The permittee has been granted permission to operate an air contaminant source in accordance with emissions limitations and monitoring requirements set forth herein.

Issue Date: **January 1, 2020** Permit Number: **574994**

Modification Date: **September 9, 2020**

Expiration Date: **December 31, 2024**

Issued To:
Primester GP

Installation Address:
1801 Warrick Drive
Kingsport

Installation Description: **Chemical Manufacturing**

ESRN	Description
82-0510-01	Ester Production (B-440-1)
82-0510-02	Acid Recovery Process (B-441-1)
82-0510-03	Cellulose Scrap Recovery Process (B-441-2)
82-0510-04	Tank Farm (B-442-1)
82-0510-05	Cooling Tower (B-447-1)

Emission Source Reference No.: **82-0510**

Renewal Application Due Date: **Between April 5, 2024 and July 4, 2024** Primary SIC: 28

Information Relied Upon: **Title V renewal application dated September 20, 2018.**

SECTION A
GENERAL PERMIT CONDITIONS

A permit issued under the provisions of paragraph 1200-03-09-.02(11) is a permit issued pursuant to the requirements of Title V of the Federal Act and its implementing Federal regulations promulgated at 40 CFR, Part 70.

A1. **Definitions.** Terms not otherwise defined in the permit shall have the meaning assigned to such terms in the referenced regulation.

TAPCR 1200-03

A2. **Compliance requirement.** All terms and conditions in a permit issued pursuant to paragraph 1200-03-09-.02(11) including any provisions designed to limit a source's potential to emit, are enforceable by the Administrator and citizens under the Federal Act.

The permittee shall comply with all conditions of its permit. Except for requirements specifically designated herein as not being federally enforceable (State Only), non-compliance with the permit requirements is a violation of the Federal Act and the Tennessee Air Quality Act and is grounds for enforcement action; for a permit termination, revocation and reissuance, or modification; or for denial of a permit renewal application. Non-compliance with permit conditions specifically designated herein as not being federally enforceable (State Only) is a violation of the Tennessee Air Quality Act and may be grounds for these actions.

TAPCR 1200-03-09-.02(11)(e)2(i) and 1200-03-09-.02(11)(e)1(vi)(I)

A3. **Need to halt or reduce activity.** The need to halt or reduce activity is not a defense for noncompliance. It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of the permit. However, nothing in this item shall be construed as precluding consideration of a need to halt or reduce activity as a mitigating factor in assessing penalties for noncompliance if the health, safety or environmental impacts of halting or reducing operations would be more serious than the impacts of continuing operations.

TAPCR 1200-03-09-.02(11)(e)1(vi)(II)

A4. **The permit.** The permit may be modified, revoked, reopened, and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or of a notification of planned changes or anticipated noncompliance does not stay any permit condition.

TAPCR 1200-03-09-.02(11)(e)1(vi)(III)

A5. **Property rights.** The permit does not convey any property rights of any sort, or any exclusive privilege.

TAPCR 1200-03-09-.02(11)(e)1(vi)(IV)

A6. **Submittal of requested information.** The permittee shall furnish to the Technical Secretary, within a reasonable time, any information that the Technical Secretary may request in writing to determine whether cause exists for modifying, revoking and reissuing, or termination of the permit or to determine compliance with the permit. Upon request, the permittee shall also furnish to the Technical Secretary copies of records required to be kept by the permit. If the permittee claims that such information is confidential, the Technical Secretary may review that claim and hold the information in protected status until such time that the Board can hear any contested proceedings regarding confidentiality disputes. If the information is desired by EPA, the permittee may mail the information directly to EPA. Any claims of confidentiality for federal purposes will be determined by EPA.

TAPCR 1200-03-09-.02(11)(e)1(vi)(V)

A7. **Severability clause.** The requirements of this permit are severable. A dispute regarding one or more requirements of this permit does not invalidate or otherwise excuse the permittee from their duty to comply with the remaining portion of the permit.

TAPCR 1200-03-09.02(11)(e)1(v)

A8. **Fee payment.**

(a) The permittee shall pay an annual Title V emission fee based upon the responsible official's choice of actual emissions, allowable emissions, or a combination of actual and allowable emissions; and on the responsible official's choice of annual accounting period. An emission cap of 4,000 tons per year per regulated pollutant per major source SIC Code shall apply to actual or allowable based emission fees. A Title V annual emission fee will not be charged for emissions in excess of the cap. Title V annual emission fees will not be charged for carbon monoxide or for greenhouse gas pollutants solely because they are greenhouse gases.

(b) Title V sources shall pay allowable based emission fees until the beginning of the next annual accounting period following receipt of their initial Title V operating permit. At that time, the permittee shall begin paying their Title V fee based upon their choice of actual or allowable based fees, or mixed actual and allowable based fees. Once permitted, the Responsible Official may revise their existing fee choice by submitting a written request to the Division no later than December 31 of the annual accounting period for which the fee is due.

(c) **W**hen paying annual Title V emission fees, the permittee shall comply with all provisions of 1200-03-26-.02 and 1200-03-09-.02(11) applicable to such fees.

(d) Where more than one allowable emission limit is applicable to a regulated pollutant, the allowable emissions for the regulated pollutants shall not be double counted. Major sources subject to the provisions of paragraph 1200-03-26-.02(9) shall apportion their emissions as follows to ensure that their fees are not double counted.

1. Sources that are subject to federally promulgated hazardous air pollutant under 40 CFR 60, 61, or 63 will place such regulated emissions in the regulated hazardous air pollutant (HAP) category.

2. A category of miscellaneous HAPs shall be used for hazardous air pollutants listed at part 1200-03-26-.02(2)(i)12 that are not subject to federally promulgated hazardous air pollutant standards under 40 CFR 60, 61, or 63.

3. HAPs that are also in the family of volatile organic compounds, particulate matter, or PM_{10} shall not be placed in either the regulated HAP category or miscellaneous HAP category.

4. Sources that are subject to a provision of chapter 1200-03-16 New Source Performance Standards (NSPS) or chapter 0400-30-39 Standards of Performance for New Stationary Sources for pollutants that are neither particulate matter, PM_{10}, sulfur dioxide (SO_2), volatile organic compounds (VOC), nitrogen oxides (NO_x), or hazardous air pollutants (HAPs) will place such regulated emissions in an NSPS pollutant category.

5. The regulated HAP category, the miscellaneous HAP category, and the NSPS pollutant category are each subject to the 4,000 ton cap provisions of subparagraph 1200-03-26-.02(2)(i).

6. Major sources that wish to pay annual emission fees for PM_{10} on an allowable emission basis may do so if they have a specific PM_{10} allowable emission standard. If a major source has a total particulate emission standard, but wishes to pay annual emission fees on an actual PM_{10} emission basis, it may do so if the PM_{10} actual emission levels are proven to the satisfaction of the Technical Secretary. The method to demonstrate the actual PM_{10} emission levels must be made as part of the source's major source operating permit in advance in order to exercise this option. The PM_{10} emissions reported under these options shall not be subject to fees under the family of particulate emissions. The 4,000 ton cap provisions of subparagraph 1200-03-26-.02(2)(i) shall also apply to PM_{10} emissions.

TAPCR 1200-03-26-.02 and 1200-03-09-.02(11)(e)1(vii)

A9. **Permit revision not required.** A permit revision will not be required under any approved economic incentives, marketable permits, emissions trading and other similar programs or process for changes that are provided for in the permit.

TAPCR 1200-03-09-.02(11)(e)1(viii)

A10. **Inspection and entry.** Upon presentation of credentials and other documents as may be required by law, the permittee shall allow the Technical Secretary or an authorized representative to perform the following for the purposes of determining compliance with the permit applicable requirements:

(a) Enter upon, at reasonable times, the permittee's premises where a source is located or emissions-related activity is conducted, or where records must be kept under the conditions of the permit;

(b) Have access to and copy, at reasonable times, any records that must be kept under the conditions of the permit;

(c) Inspect at reasonable times any facilities, equipment (including monitoring and air pollution control equipment), practices, or operations regulated or required under the permit; and

(d) As authorized by the Clean Air Act and TAPCR 1200-03-10, sample or monitor at reasonable times substances or parameters for the purpose of assuring compliance with the permit or applicable requirements.

(e) "Reasonable times" shall be considered to be customary business hours unless reasonable cause exists to suspect noncompliance with the Act, TAPCR 1200-03 or any permit issued pursuant thereto and the Technical Secretary specifically authorizes an inspector to inspect a facility at any other time.

TAPCR 1200-03-09-.02(11)(e)3.(ii)

A11. **Permit shield.**

(a) Compliance with the conditions of this permit shall be deemed compliance with all applicable requirements as of the date of permit issuance, provided that:

1. Such applicable requirements are included and are specifically identified in the permit; or

2. The Technical Secretary, in acting on the permit application or revision, determines in writing that other requirements specifically identified are not applicable to the source, and the permit includes the determination or a concise summary thereof.

(b) Nothing in this permit shall alter or affect the following:

1. The provisions of section 303 of the Federal Act (emergency orders), including the authority of the Administrator under that section. Similarly, the provisions of T.C.A. §68-201-109 (emergency orders) including the authority of the Governor under the section;

2. The liability of an owner or operator of a source for any violation of applicable requirements prior to or at the time of permit issuance;

3. The applicable requirements of the acid rain program, consistent with section 408(a) of the Federal Act; or

4. The ability of EPA to obtain information from a source pursuant to section 114 of the Federal Act.

(c) Permit shield is granted to the permittee.

TAPCR 1200-03-09-.02(11)(e)6

A12. Permit renewal and expiration.

(a) An application for permit renewal must be submitted at least 180 days, but no more than 270 days prior to the expiration of this permit. Permit expiration terminates the source's right to operate unless a timely and complete renewal application has been submitted.

(b) If the permittee submits a timely and complete application for permit renewal the source will not be considered to be operating without a permit until the Technical Secretary takes final action on the permit application, except as otherwise noted in paragraph 1200-03-09-.02(11).

(c) This permit, its shield provided in Condition A11, and its conditions will be extended and effective after its expiration date provided that the source has submitted a timely, complete renewal application to the Technical Secretary.

TAPCR 1200-03-09-.02(11)(f)2 and 3, 1200-03-09-.02(11)(d)1(i)(III), and 1200-03-09-.02(11)(a)2

A13. Reopening for cause.

(a) A permit shall be reopened and revised prior to the expiration of the permit under any of the circumstances listed below:

1. Additional applicable requirements under the Federal Act become applicable to the sources contained in this permit provided the permit has a remaining term of three or more years. Such a reopening shall be completed not later than 18 months after promulgation of the applicable requirement. No such reopening is required if the effective date of the requirement is later than the permit expiration date of this permit, unless the original has been extended pursuant to 1200-03-09-.02(11)(a)2.

2. Additional requirements become applicable to an affected source under the acid rain program.

3. The Technical Secretary or EPA determines that the permit contains a material mistake or that inaccurate statements were made in establishing the emissions standards or other terms or conditions of the permit.

4. The Technical Secretary or EPA determines that the permit must be revised or revoked to assure compliance with the applicable requirements.

(b) Proceedings to reopen and issue a permit shall follow the same proceedings as apply to initial permit issuance and shall affect only those parts of the permit for which cause to reopen exists, and not the entire permit. Such reopening shall be made as expeditiously as practicable.

(c) Reopenings for cause shall not be initiated before a notice of such intent is provided to the permittee by the Technical Secretary at least 30 days in advance of the date that the permit is to be reopened except that the Technical Secretary may provide a shorter time period in the case of an emergency. An emergency shall be established by the criteria of T.C.A. 68-201-109 or other compelling reasons that public welfare is being adversely affected by the operation of a source that is in compliance with its permit requirements.

(d) If the Administrator finds that cause exists to terminate, modify, or revoke and reissue a permit as identified in A13, he is required under federal rules to notify the Technical Secretary and the permittee of such findings in writing. Upon receipt of such notification, the Technical Secretary shall investigate the matter in order to determine if he agrees or disagrees with the Administrator's findings. If he agrees with the Administrator's findings, the Technical Secretary shall conduct the reopening in the following manner:

1. The Technical Secretary shall, within 90 days after receipt of such notification, forward to EPA a proposed determination of termination, modification, or revocation and reissuance, as appropriate. If the Administrator grants additional time to secure permit applications or additional information from the permittee, the Technical Secretary shall have the additional time period added to the standard 90 day time period.

2. EPA will evaluate the Technical Secretary's proposed revisions and respond as to their evaluation.

3. If EPA agrees with the proposed revisions, the Technical Secretary shall proceed with the reopening in the same manner prescribed under Condition A13 (b) and Condition A13 (c).

4. If the Technical Secretary disagrees with either the findings or the Administrator that a permit should be reopened or an objection of the Administrator to a proposed revision to a permit submitted pursuant to Condition A13(d), he shall bring the matter to the Board at its next regularly scheduled meeting for instructions as to how he should proceed. The permittee shall be required to file a written brief expressing their position relative to the Administrator's objection and have a responsible official present at the meeting to answer questions for the Board. If the Board agrees that EPA is wrong in their demand for a permit revision, they shall instruct the Technical Secretary to conform to EPA's demand, but to issue the permit under protest preserving all rights available for litigation against EPA.

TAPCR 1200-03-09-.02(11)(f)6 and 7.

A14. **Permit transference.** An administrative permit amendment allows for a change of ownership or operational control of a source where the Technical Secretary determines that no other change in the permit is necessary, provided that the following requirements are met:

(a) Transfer of ownership permit application is filed consistent with the provisions of 1200-03-09-.03(6), and

(b) written agreement containing a specific date for transfer of permit responsibility, coverage, and liability between the current and new permittee has been submitted to the Technical Secretary.

TAPCR 1200-03-09-.02(11)(f)4(i)(IV) and 1200-03-09-.03(6)

A15. **Air pollution alert.** When the Technical Secretary has declared that an air pollution alert, an air pollution warning, or an air pollution emergency exists, the permittee must follow the requirements for that episode level as outlined in TAPCR 1200-03-09-.03(1) and 1200-03-15-.03.

A16. **Construction permit required.** Except as exempted in TAPCR 1200-03-09-.04, or excluded in TAPCR 1200-03-02-.01(1)(aa) or 1200-03-02-.01(1)(cc), this facility shall not begin the construction of a new air contaminant source or the modification of an air contaminant source which may result in the discharge of air contaminants without first having applied for and received from the Technical Secretary a construction permit for the construction or modification of such air contaminant source.

TAPCR 1200-03-09-.01(1)(a)

A17. **Notification of changes.** The permittee shall notify the Technical Secretary 30 days prior to commencement of any of the following changes to an air contaminant source which would not be a modification requiring a construction permit.
(a) change in air pollution control equipment
(b) change in stack height or diameter
(c) change in exit velocity of more than 25 percent or exit temperature of more than 15 percent based on absolute temperature.

TAPCR 1200-03-09-.02(7)

A18. **Schedule of compliance.** The permittee will comply with any applicable requirement that becomes effective during the permit term on a timely basis. If the permittee is not in compliance the permittee must submit a schedule for coming into compliance which must include a schedule of remedial measure(s), including an enforceable set of deadlines for specific actions.

TAPCR 1200-03-09-.02(11)(d)3 and 40 CFR Part 70.5(c)

A19. **Title VI.**

(a) The permittee shall comply with the standards for recycling and emissions reduction pursuant to 40 CFR, Part 82, Subpart F, except as provided for motor vehicle air conditioners (MVACs) in Subpart B:

1. Persons opening appliances for maintenance, service, repair, or disposal must comply with the required practices pursuant to Section 82.156.

2. Equipment used during the maintenance, service, repair, or disposal of appliances must comply with the standards for recycling and recovery equipment pursuant to Section 82.158.

3. Persons performing maintenance, service, repair, or disposal of appliances must be certified by an approved technician certification program pursuant to Section 82.161.

(b) If the permittee performs a service on motor (fleet) vehicles when this service involves ozone depleting substance refrigerant in the motor vehicle air conditioner (MVAC), the permittee is subject to all the applicable requirements as specified in 40 CFR, Part 82, Subpart B, Servicing of Motor Vehicle Air Conditioners.

(c) The permittee shall be allowed to switch from any ozone-depleting substance to any alternative that is listed in the Significant New Alternatives Program (SNAP) promulgated pursuant to 40 CFR, Part 82, Subpart G, Significant New Alternatives Policy Program.

A20. **112 (r).** Sources which are subject to the provisions of Section 112(r) of the federal Clean Air Act or any federal regulations promulgated thereunder, shall annually certify in writing to the Technical Secretary that they are properly following their accidental release plan. The annual certification is due in the office of the Technical Secretary no later than January 31 of each year. Said certification will be for the preceding calendar year.

TAPCR 1200-03-32-.03(3)

SECTION B
GENERAL CONDITIONS for MONITORING, REPORTING, and ENFORCEMENT

B1. **Recordkeeping.** Monitoring and related record keeping shall be performed in accordance with the requirements specified in the permit conditions for each individual permit unit. In no case shall reports of any required monitoring and record keeping be submitted less frequently than every six months.

(a) Where applicable, records of required monitoring information include the following:

1. The date, place as defined in the permit, and time of sampling or measurements;
2. The date(s) analyses were performed;
3. The company or entity that performed the analysis;
4. The analytical techniques or methods used;
5. The results of such analyses; and
6. The operating conditions as existing at the time of sampling or measurement.

(b) Digital data accumulation which utilizes valid data compression techniques shall be acceptable for compliance determination as long as such compression does not violate an applicable requirement and its use has been approved in advance by the Technical Secretary.

TAPCR 1200-03-09-.02(11)(e)1(iii)

B2. **Retention of monitoring data.** The permittee shall retain records of all required monitoring data and support information for a period of at least five years from the date of the monitoring sample, measurement, report, or application. Support information includes all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, and copies of all reports required by the permit.

TAPCR 1200-03-09-.02(11)(e)1(iii)(II)II

B3. **Reporting.** Reports of any required monitoring and record keeping shall be submitted to the Technical Secretary in accordance with the frequencies specified in the permit conditions for each individual permit unit. Reports shall be submitted within 60 days of the close of the reporting period unless otherwise noted. All instances of deviations from permit requirements must be clearly identified in such reports. All required reports must be certified by a responsible official. Reports required under "State only requirements" are not required to be certified by a responsible official.

TAPCR 1200-03-09-.02(11)(e)1(iii)

B4. **Certification.** Except for reports required under “State Only” requirements, any application form, report or compliance certification submitted pursuant to the requirements of this permit shall contain certification by a responsible official of truth, accuracy and completeness. This certification shall state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate and complete.

TAPCR 1200-03-09-.02(11)(d)4

B5. **Annual compliance certification.** The permittee shall submit annually compliance certifications with terms and conditions contained in Sections A, B, D and E of this permit, including emission limitations, standards, or work practices. This compliance certification shall include all of the following (provided that the identification of applicable information may cross-reference the permit or previous reports, as applicable):

(a) The identification of each term or condition of the permit that is the basis of the certification;

(b) The identification of the method(s) or other means used by the owner or operator for determining the compliance status with each term and condition during the certification period; such methods and other means shall include, at a minimum, the methods and means required by this permit. If necessary, the owner or operator also shall identify any

other material information that must be included in the certification to comply with section 113(c)(2) of the Federal Act, which prohibits knowingly making a false certification or omitting material information;

(c) The status of compliance with the terms and conditions of the permit for the period covered by the certification, including whether compliance during the period was continuous or intermittent. The certification shall be based on the method or means designated in B5(b) above. The certification shall identify each deviation and take it into account in the compliance certification. The certification shall also identify as possible exceptions to compliance any periods during which compliance is required and in which an excursion* or exceedance** as defined below occurred; and

(d) Such other facts as the Technical Secretary may require to determine the compliance status of the source.

* "Excursion" shall mean a departure from an indicator range established for monitoring under this paragraph, consistent with any averaging period specified for averaging the results of the monitoring.

** "Exceedance" shall mean a condition that is detected by monitoring that provides data in terms of an emission limitation or standard and that indicates that emissions (or opacity) are greater than the applicable emission limitation or standard (or less than the applicable standard in the case of a percent reduction requirement) consistent with any averaging period specified for averaging the results of the monitoring.

40 CFR Part 70.6(c)(5)(iii) as amended in the Federal Register Vol. 79, No.144, July 28, 2014, pages 43661 through 43667

B6 (AA1). **Submission of compliance certification.** The compliance certification shall be submitted to:

The Tennessee Department of Environment and Conservation Office specified in Section E of this permit	and	Air Enforcement Branch U. S. EPA Region IV 61 Forsyth Street, SW Atlanta, Georgia 30303

TAPCR 1200-03-09-.02(11)(e)3(v)(IV)

B7. **Emergency provisions.** An emergency constitutes an affirmative defense to an enforcement action brought against this source for noncompliance with a technology based emission limitation due to unavoidable increases in emissions attributable to the emergency. An emergency shall not include noncompliance to the extent caused by improperly designed equipment, lack of preventative maintenance, careless or improper operation, or operator error.

(a) The affirmative defense of the emergency shall be demonstrated through properly signed, contemporaneous operating logs, or other relevant evidence that:

1. An emergency occurred and that the permittee can identify the probable cause(s) of the emergency. "Probable" must be supported by a credible investigation into the incident that seeks to identify the causes and results in an explanation supported by generally accepted engineering or scientific principles.

2. The permitted source was at the time being properly operated. In determining whether or not a source was being properly operated, the Technical Secretary shall examine the source's written standard operating procedures which were in effect at the time of the noncompliance and any other code as detailed below that would be relevant to preventing the noncompliance. Adherence to the source's standard operating procedures will be the test of adequate preventative maintenance, careless operation, improper operation or operator error to the extent that such adherence would prevent noncompliance. The source's failure to follow recognized standards of practice to the extent that adherence to such a standard would have prevented noncompliance will disqualify the source from any claim of an emergency and an affirmative defense.

3. During the period of the emergency, the permittee took all reasonable steps to minimize levels of emissions that exceeded the emission standards, or other requirements in the permit.

4. The permittee submitted notice of the emergency to the Technical Secretary according to the notification criteria for malfunctions in rule 1200-03-20-.03. For the purposes of this condition, "emergency" shall be substituted for "malfunction(s)" in rule 1200-03-20-.03 to determine the relevant notification threshold. The

notice shall include a description of the emergency, any steps taken to mitigate emissions, and corrective actions taken.

(b) In any enforcement proceeding the permittee seeking to establish the occurrence of an emergency has the burden of proof.

(c) The provisions of this condition are in addition to any emergency, malfunction or upset requirement contained in Division 1200-03 or other applicable requirement.

TAPCR 1200-03-09-.02(11)(e)7

B8. **Excess emissions reporting.**

(a) The permittee shall promptly notify the Technical Secretary when any emission source, air pollution control equipment, or related facility breaks down in such a manner to cause the emission of air contaminants in excess of the applicable emission standards contained in Division 1200-03 or any permit issued thereto, or of sufficient duration to cause damage to property or public health. The permittee must provide the Technical Secretary with a statement giving all pertinent facts, including the estimated duration of the breakdown. Violations of the visible emission standard which occur for less than 20 minutes in one day (midnight to midnight) need not be reported. Prompt notification will be within 24 hours of the malfunction and shall be provided by telephone to the Division's Nashville office. The Technical Secretary shall be notified when the condition causing the failure or breakdown has been corrected. In attainment and unclassified areas if emissions other than from sources designated as significantly impacting on a nonattainment area in excess of the standards will not and do not occur over more than a 24-hour period (or will not recur over more than a 24-hour period) and no damage to property and or public health is anticipated, notification is not required.

(b) Any malfunction that creates an imminent hazard to health must be reported by telephone immediately to the Division's Nashville office at (615) 532-0554 and to the State Civil Defense.

(c) A log of all malfunctions, startups, and shutdowns resulting in emissions in excess of the standards in Division 1200-03 or any permit issued thereto must be kept at the plant. All information shall be entered in the log no later than 24 hours after the startup or shutdown is complete, or the malfunction has ceased or has been corrected. Any later discovered corrections can be added in the log as footnotes with the reason given for the change. This log must record at least the following:

1. Stack or emission point involved
2. Time malfunction, startup, or shutdown began and/or when first noticed
3. Type of malfunction and/or reason for shutdown
4. Time startup or shutdown was complete or time the air contaminant source returned to normal operation
5. The company employee making entry on the log must sign, date, and indicate the time of each log entry

The information under items 1. and 2. must be entered into the log by the end of the shift during which the malfunction or startup began. For any source utilizing continuous emission(s) monitoring, continuous emission(s) monitoring collection satisfies the above log keeping requirement.

TAPCR 1200-03-20-.03 and .04

B9. **Malfunctions, startups and shutdowns - reasonable measures required.** The permittee must take all reasonable measures to keep emissions to a minimum during startups, shutdowns, and malfunctions. These measures may include installation and use of alternate control systems, changes in operating methods or procedures, cessation of operation until the process equipment and/or air pollution control equipment is repaired, maintaining sufficient spare parts, use of overtime labor, use of outside consultants and contractors, and other appropriate means. Failures that are caused by poor maintenance, careless operation or any other preventable upset condition or preventable equipment breakdown shall not be considered malfunctions. This provision does not apply to standards found in 40 CFR, Parts 60(Standards of performance for new stationary sources), 61(National emission standards for hazardous air pollutants) and 63(National emission standards for hazardous air pollutants for source categories). TAPCR 1200-03-20-.02

B10. Reserved.

B11. **Report required upon the issuance of a notice of violation for excess emissions.** The permittee must submit within 20 days after receipt of the notice of violation, the data required below. If this data has previously been available to the Technical Secretary prior to the issuance of the notice of violation no further action is required of the violating source. However, if the source desires to submit additional information, then this must be submitted within the same 20-day time period. The minimum data requirements are:

(a) The identity of the stack and/or other emission point where the excess emission(s) occurred;

(b) The magnitude of the excess emissions expressed in pounds per hour and the units of the applicable emission limitation and the operating data and calculations used in determining the magnitude of the excess emissions;

(c) The time and duration of the emissions;

(d) The nature and cause of such emissions;

(e) For malfunctions, the steps taken to correct the situation and the action taken or planned to prevent the recurrence of such malfunctions;

(f) The steps taken to limit the excess emissions during the occurrence reported, and

(g) If applicable, documentation that the air pollution control equipment, process equipment, or processes were at all times maintained and operated in a manner consistent with good operating practices for minimizing emissions.

Failure to submit the required report within the 20-day period specified shall preclude the admissibility of the data for determination of potential enforcement action.

TAPCR 1200-03-20-.06(2), (3) and (4)

SECTION C
PERMIT CHANGES

C1. **Operational flexibility changes.** The source may make operational flexibility changes that are not addressed or prohibited by the permit without a permit revision subject to the following requirements:

(a) The change cannot be subject to a requirement of Title IV of the Federal Act or Chapter 1200-03-30.

(b) The change cannot be a modification under any provision of Title I of the federal Act or Division 1200-03.

(c) Each change shall meet all applicable requirements and shall not violate any existing permit term or condition.

(d) The source must provide contemporaneous written notice to the Technical Secretary and EPA of each such change, except for changes that are below the threshold of levels that are specified in Rule 1200-03-09-.04.

(e) Each change shall be described in the notice including the date, any change in emissions, pollutants emitted, and any applicable requirements that would apply as a result of the change.

(f) The change shall not qualify for a permit shield under the provisions of part 1200-03-09-.02(11)(e)6.

(g) The permittee shall keep a record describing the changes made at the source that result in emissions of a regulated air pollutant subject to an applicable requirement, but not otherwise regulated under the permit, and the emissions resulting from those changes. The records shall be retained until the changes are incorporated into subsequently issued permits.

TAPCR 1200-03-09-.02(11)(a)4 (ii)

C2. **Section 502(b)(10) changes.**

(a) The permittee can make certain changes without requiring a permit revision, if the changes are not modifications under Title I of the Federal Act or Division 1200-03 and the changes do not exceed the emissions allowable under the permit. The permittee must, however, provide the Administrator and Technical Secretary with written notification within a minimum of seven days in advance of the proposed changes. The Technical Secretary may waive the seven-day advance notice in instances where the source demonstrates in writing that an emergency necessitates the change. Emergency shall be demonstrated by the criteria of TAPCR 1200-03-09-.02(11)(e)7 and in no way shall it include changes solely to take advantages of an unforeseen business opportunity. The Technical Secretary and EPA shall attach each such notice to their copy of the relevant permit.

(b) The written notification must be signed by a facility Title V responsible official and include the following:

1. a brief description of the change within the permitted facility;
2. the date on which the change will occur;
3. a declaration and quantification of any change in emissions;
4. a declaration of any permit term or condition that is no longer applicable as a result of the change; and
5. a declaration that the requested change is not a Title I modification and will not exceed allowable emissions under the permit.

(c) The permit shield provisions of TAPCR 1200-03-09-.02(11)(e)6 shall not apply to Section 502(b)(10) changes.

TAPCR 1200-03-09-.02(11)(a)4 (i)

C3. Administrative amendment.

(a) Administrative permit amendments to this permit shall be in accordance with 1200-03-09-.02(11)(f)4. The source may implement the changes addressed in the request for an administrative amendment immediately upon submittal of the request.

(b) The permit shield shall be extended as part of an administrative permit amendment revision consistent with the provisions of TAPCR 1200-03-09-.02(11)(e)6 for such revisions made pursuant to item (c) of this condition which meet the relevant requirements of TAPCR 1200-03-09-.02(11)(e), 1200-03-09-.02(11)(f), and 1200-03-09-.02(11)(g) for significant permit modifications.

(c) Proceedings to review and grant administrative permit amendments shall be limited to only those parts of the permit for which cause to amend exists, and not the entire permit.

TAPCR 1200-03-09-.02(11)(f)4

C4. Minor permit modifications.

(a) The permittee may submit an application for a minor permit modification in accordance with TAPCR 1200-03-09-.02(11)(f)5(ii).

(b) The permittee may make the change proposed in its minor permit modification immediately after an application is filed with the Technical Secretary.

(c) Proceedings to review and modify permits shall be limited to only those parts of the permit for which cause to modify exists, and not the entire permit.

(d) Minor permit modifications do not qualify for a permit shield.

TAPCR 1200-03-09-.02(11)(f)5(ii)

C5. Significant permit modifications.

(a) The permittee may submit an application for a significant modification in accordance with TAPCR 1200-03-09-.02(11)(f)5(iv).

(b) Proceedings to review and modify permits shall be limited to only those parts of the permit for which cause to modify exists, and not the entire permit.

TAPCR 1200-03-09-.02(11)(f)5(iv)

C6. New construction or modifications. Future construction at this facility that is subject to the provisions of TAPCR 1200-03-09-.01 shall be governed by the following:

(a) The permittee shall designate in their construction permit application the route that they desire to follow for the purposes of incorporating the newly constructed or modified sources into their existing operating permit. The Technical Secretary shall use that information to prepare the operating permit application submittal deadlines in their construction permit.

(b) Sources desiring the permit shield shall choose the administrative amendment route of TAPCR 1200-03-09-.02(11)(f)4 or the significant modification route of TAPCR 1200-03-09-.02(11)(f)5(iv).

(c) Sources desiring expediency instead of the permit shield shall choose the minor permit modification procedure route of TAPCR 1200-03-09-.02(11)(f)5(ii) or group processing of minor modifications under the provisions of TAPCR 1200-03-09-.02(11)(f)5(iii) as applicable to the magnitude of their construction.

TAPCR 1200-03-09-.02(11)(d) 1(i)(V)

SECTION D
GENERAL APPLICABLE REQUIREMENTS

D1. **Visible emissions.** With the exception of air emission sources exempt from the requirements of TAPCR 1200-03-05 and air emission sources for which a different opacity standard is specifically provided elsewhere in this permit, the permittee shall not cause, suffer, allow or permit discharge of a visible emission from any air contaminant source with an opacity in excess of 20% for an aggregate of more than five minutes in any one hour or more than 20 minutes in any 24-hour period; provided, however, that for fuel burning installations with fuel burning equipment of input capacity greater than 600 million Btu per hour, the permittee shall not cause, suffer, allow, or permit discharge of a visible emission from any fuel burning installation with an opacity in excess of 20% (six-minute average) except for one six-minute period per one hour of not more than 40% percent opacity. Sources constructed or modified after July 7, 1992 shall utilize six-minute averaging.

Consistent with the requirements of TAPCR 1200-03-20, due allowance may be made for visible emissions in excess of that permitted under TAPCR 1200-03-05 which are necessary or unavoidable due to routine startup and shutdown conditions. The facility shall maintain a continuous, current log of all excess visible emissions showing the time at which such conditions began and ended and that such record shall be available to the Technical Secretary or an authorized representative upon request.

TAPCR 1200-03-05-.01(1), 1200-03-05-.03(6), and 1200-03-05-.02(1)

D2. **General provisions and applicability for non-process gaseous emissions.** Any person constructing or otherwise establishing a non-portable air contaminant source emitting gaseous air contaminants after April 3, 1972, or relocating an air contaminant source more than 1.0 km from the previous position after November 6, 1988, shall install and utilize the best equipment and technology currently available for controlling such gaseous emissions.

TAPCR 1200-03-06-.03(2)

D3. **Non-process emission standards.** The permittee shall not cause, suffer, allow, or permit particulate emissions from non-process sources in excess of the standards in TAPCR 1200-03-06.

D4. **General provisions and applicability for process gaseous emissions.** Any person constructing or otherwise establishing an air contaminant source emitting gaseous air contaminants after April 3, 1972, or relocating an air contaminant source more than 1.0 km from the previous position after November 6, 1988, shall install and utilize equipment and technology which is deemed reasonable and proper by the Technical Secretary.

TAPCR 1200-03-07-.07(2)

D5. **Particulate emissions from process emission sources.** The permittee shall not cause, suffer, allow, or permit particulate emissions from process sources in excess of the standards in TAPCR 1200-03-07.

D6. **Sulfur dioxide emission standards.** The permittee shall not cause, suffer, allow, or permit Sulfur dioxide emissions from process and non-process sources in excess of the standards in TAPCR 1200-03-14. Regardless of the specific emission standard, new process sources shall utilize the best available control technology as deemed appropriate by the Technical Secretary of the Tennessee Air Pollution Control Board.

D7. **Fugitive Dust.**

(a) The permittee shall not cause, suffer, allow, or permit any materials to be handled, transported, or stored; or a building, its appurtenances, or a road to be used, constructed, altered, repaired, or demolished without taking reasonable precautions to prevent particulate matter from becoming airborne. Such reasonable precautions shall include, but not be limited to, the following:

1. Use, where possible, of water or chemicals for control of dust in demolition of existing buildings or structures, construction operations, grading of roads, or the clearing of land;

2. Application of asphalt, water, or suitable chemicals on dirt roads, material stock piles, and other surfaces which can create airborne dusts;

3. Installation and use of hoods, fans, and fabric filters to enclose and vent the handling of dusty materials. Adequate containment methods shall be employed during sandblasting or other similar operations.

(b) The permittee shall not cause, suffer, allow, or permit fugitive dust to be emitted in such manner to exceed five minutes per hour or 20 minutes per day as to produce a visible emission beyond the property line of the property on which the emission originates, excluding malfunction of equipment as provided in TAPCR 1200-03-20.

TAPCR 1200-03-08

D8. **Open burning.** The permittee shall comply with the TAPCR 1200-03-04 for all open burning activities at the facility.

TAPCR 1200-03-04

D9. **Asbestos.** Where applicable, the permittee shall comply with the requirements of TAPCR 1200-03-11-.02(2)(d) when conducting any renovation or demolition activities at the facility.

TAPCR 1200-03-11-.02(2)(d) and 40 CFR, Part 61

D10. **Annual certification of compliance.** The generally applicable requirements set forth in Section D of this permit are intended to apply to activities and sources that are not subject to source-specific applicable requirements contained in State of Tennessee and U.S. EPA regulations. By annual certification of compliance, the permittee shall be considered to meet the monitoring and related record keeping and reporting requirements of TAPCR 1200-03-09-.02(11)(e)1.(iii) and 1200-03-10-.04(2)(b)1 and compliance requirements of TAPCR 1200-03-09-.02(11)(e)3.(i). The permittee shall submit compliance certification for these conditions annually.

D11. **Emission Standards for Hazardous Air Pollutants.** When applicable, the permittee shall comply with the TAPCR 0400-30-38 for all emission sources subject to a requirement contained therein.

TAPCR 0400-30-38

D12. **Standards of Performance for New Stationary Sources.** When applicable, the permittee shall comply with the TAPCR 0400-30-39 for all emission sources subject to a requirement contained therein.

D13. **Gasoline Dispensing Facilities.** When applicable, the permittee shall comply with the TAPCR 1200-03-18-.24 for all emission sources subject to a requirement contained therein.

D14. **Internal Combustion Engines.**

(a) All stationary reciprocating internal combustion engines, including engines deemed insignificant activities and insignificant emission units, shall comply with the applicable provisions of TAPCR 0400-30-38-.01.

(b) All stationary compression ignition internal combustion engines, including engines deemed insignificant activities and insignificant emission units, shall comply with the applicable provisions of TAPCR 0400-30-39-.01.

(c) All stationary spark ignition internal combustion engines, including engines deemed insignificant activities and insignificant emission units, shall comply with the applicable provisions of TAPCR 0400-30-39-.02.

TAPCR 0400-30-38 and 39

SECTION E

SOURCE SPECIFIC EMISSION STANDARDS, OPERATING LIMITATIONS, and MONITORING, RECORDKEEPING and REPORTING REQUIREMENTS

82-0510	**Facility Description:**	Production of cellulose esters, acid recovery process, cellulose scrap recovery process, and associated storage tanks.

Conditions E1 through E2-13 apply to all sources in Section E of this permit unless otherwise noted.

E1 (AA1). **Fee payment**

FEE EMISSIONS SUMMARY TABLE FOR MAJOR SOURCE 82-0510			
REGULATED POLLUTANTS	**ALLOWABLE EMISSIONS (tons per AAP)**	**ACTUAL EMISSIONS (tons per AAP)**	**COMMENTS**
PARTICULATE MATTER (PM)	**7.1**	**AEAR**	**Includes all fee emissions.**
PM_{10}	**N/A**	**N/A**	
SO_2	**1.1**	**AEAR**	**Includes all fee emissions.**
VOC	**45.35**	**AEAR**	**Does not include VOC HAP with a standard.**

NON-VOC GASEOUS GROUP	**N/A**	**N/A**	
PM FAMILY GROUP	**N/A**	**N/A**	
CATEGORY OF NSPS POLLUTANTS NOT LISTED ABOVE***			
EACH NSPS POLLUTANT NOT LISTED ABOVE	**N/A**	**N/A**	

NOTES

AAP The **Annual Accounting Period** (**AAP**) is a twelve (12) consecutive month period that **either (a) begins each July 1st and ends June 30th of the following year when fees are paid on a fiscal year basis, or (b) begins January 1st and ends December 31st of the same year when paying on a calendar year basis.** The **Annual Accounting Period** at the time of permit renewal issuance **began July 1, 2020 and ends June 30, 2021.** The next Annual Accounting Period begins **July 1, 2021** and ends **June 30, 2022,** unless a request to change the annual accounting period is submitted by the responsible official as required by subparagraph 1200-03-26-.02(9)(b) and approved by the Technical Secretary**.** If the permittee wishes to revise their annual accounting period or their annual emission fee basis as allowed by subparagraph 1200-03-26-.02(9)(b), the responsible official must submit the request to the Division in writing on or before December 31 of the annual accounting period for which the fee is due. If a change in fee basis from allowable emissions to actual emissions for any pollutant is requested, the request from the responsible official must include the methods that will be used to determine actual emissions. Changes in fee bases must be made using the Title V Fee Selection form, form number APC 36 (CN-1583), included as Attachment 5 to this permit and available on the Division of Air Pollution Control's website.

N/A **N/A** indicates that no emissions are specified for fee computation.

AEAR If the permittee is paying annual emission fees on an actual emissions basis, **AEAR** indicates that an **A**ctual **E**missions **A**nalysis is **R**equired to determine the actual emissions of:

(1) **each regulated pollutant** (Particulate matter, SO_2, VOC, NO_X and so forth. See TAPCR 1200-03-26-.02(2)(i) for the definition of a regulated pollutant.),
(2) **each pollutant group** (VOC Family, Non-VOC Gaseous, and Particulate Family),
(3) the **Miscellaneous HAP Category,**
(4) the **Specific HAP Category**, and
(5) the **NSPS Category**

under consideration during the **Annual Accounting Period**.

* **Category Of Miscellaneous HAP (HAP Without A Standard):** This category is made-up of hazardous air pollutants that do not have a federal or state standard. Each HAP is classified into one of three groups, the **VOC Family** group**, the Non-VOC Gaseous** group**,** or the **Particulate (PM) Family** group**. For fee computation**, the **Miscellaneous HAP Category** is subject to the 4,000 ton cap provisions of subparagraph 1200-03-26-.02(2)(i).

** **Category Of Specific HAP (HAP With A Standard):** This category is made-up of hazardous air pollutants (HAP) that are subject to Federally promulgated Hazardous Air Pollutant Standards that can be imposed under Chapter 1200-03-11 or Chapter 1200-03-31. Each individual hazardous air pollutant is classified into one of three groups, the **VOC Family** group**, the Non-VOC Gaseous** group**,** or the **Particulate (PM) Family** group**. For fee computation**, each individual hazardous air pollutant of the **Specific HAP Category** is subject to the 4,000 ton cap provisions of subparagraph 1200-03-26-.02(2)(I).

*** **Category Of NSPS Pollutants Not Listed Above:** This category is made-up of each **N**ew **S**ource **P**erformance **S**tandard (**NSPS**) pollutant whose emissions are not included in the **PM**, **SO_2, VOC** or **NO_X** emissions from each source in this permit. **For fee computation**, each **NSPS pollutant not listed above** is subject to the 4,000 ton cap provisions of subparagraph 1200-03-26-.02(2)(i).

END NOTES

The permittee shall:

(1) Pay Title V **annual emission fees**, on the emissions and year bases requested by the responsible official and approved by the Technical Secretary, for each annual accounting period (AAP) by the payment deadline(s) established in TAPCR 1200-03-26-.02(9)(g). Fees may be paid on an **actual**, **allowable**, or **mixed** emissions basis; and on either a **state fiscal year** or a **calendar year**, provided the requirements of 1200-03-26-.02(9)(b) are met. If any part of any fee imposed under TAPCR 1200-03-26-.02 is not paid within fifteen (15) days of the due date, penalties shall at once accrue as specified in TAPCR 1200-03-26-.02(8).

(2) Sources paying annual emissions fees on an allowable emissions basis: pay annual allowable based emission fees for each annual accounting period pursuant to TAPCR 1200-03-26-.02(9)(d).

(3) Sources paying annual emissions fees on an actual emissions basis: prepare an **actual emissions analysis** for each AAP and pay **actual based emission fees** pursuant to TAPCR 1200-03-26-.02(9)(d). The **actual emissions analysis** shall include:
(a) the completed **Fee Emissions Summary Table**,
(b) each **actual emissions analysis** required**,** and
(c) the actual emission records for each pollutant and each source as required for actual emission fee determination, or a summary of the actual emission records required for fee determination, as specified by the Technical Secretary or the Technical Secretary's representative. These calculations must be based on the annual fee basis approved by the Technical Secretary (a state fiscal year [July 1 through June 30] or a calendar year [January 1 through December 31]). These records shall be used to complete the **actual emissions analyses** required by the above **Fee Emissions Summary Table**.

(4) Sources paying annual emissions fees on a mixed emissions basis: for all pollutants and all sources for which the permittee has chosen an actual emissions basis, prepare an **actual emissions analysis** for each AAP and pay **actual based emission fees** pursuant to TAPCR 1200-03-26-.02(9)(d). The **actual emissions analysis** shall include:

(a) the completed **Fee Emissions Summary Table**,
(b) each **actual emissions analysis** required**,** and
(c) the actual emission records for each pollutant and each source as required for actual emission fee determination, or a summary of the actual emission records required for fee determination, as specified by the Technical Secretary or the Technical Secretary's representative. These calculations must be based on the fee bases approved by the Technical Secretary (payment on an actual or mixed emissions basis) and payment on a state fiscal year (July 1 through June 30) or a calendar year (January 1 through December 31). These records shall be used to complete the **actual emissions analysis**.

For all pollutants and all sources for which the permittee has chosen an allowable emissions basis, pay allowable based emission fees pursuant to TAPCR 1200-03-26-.02(9)(d).

(5) When paying on an actual or mixed emissions basis, submit the **actual emissions analyses** at the time the fees are paid in full.

The annual emission fee due dates are specified in TAPCR 1200-03-26-.02(g) and are dependent on the Responsible Official's choice of fee bases as described above. If any part of any fee imposed under TAPCR 1200-03-26-.02 is not paid within 15 days of the due date, penalties shall at once accrue as specified in TAPCR 1200-03-26-.02(8). Emissions for regulated pollutants shall not be double counted as specified in Condition A8(d) of this permit.

Payment of the fee due and the actual emissions analysis (if required) shall be submitted to The Technical Secretary at the following address:

Payment of Fee to:
The Tennessee Department of Environment and Conservation
Division of Fiscal Services
Consolidated Fee Section – APC
William R. Snodgrass Tennessee Tower
312 Rosa L. Parks Avenue, 10th Floor
Nashville, Tennessee 37243

and

Actual Emissions Analyses to:
The Tennessee Department of Environment and Conservation
Division of Air Pollution Control
East Tennessee Permit Program
William R. Snodgrass Tennessee Tower
312 Rosa L. Parks Avenue, 15th Floor
Nashville, Tennessee 37243
or
An electronic copy (PDF) of actual emissions analysis can also be submitted to: apc.inventory@tn.gov

E2. General Facility Requirements

E2-1. Reporting requirements.

(a) **Semiannual reports.** Semiannual reports shall cover the six-month periods from **January 1** through **June 30** of each calendar year and **July 1** through **December 31** of each calendar year and shall be submitted within 60 days after the end of each six-month period. The first semiannual reports following issuance of this permit shall cover the following permits and reporting periods:

Permit Number	Reporting Period	Information Required
567676	July 1 through December 31, 2019	See Condition E2-1(a) of permit 567676
574994	January 1 through June 30, 2020	See below

Semiannual reports of this facility (***82-0510***) shall include:

(1) Any monitoring and recordkeeping required by Conditions ***E3-3, E3-4, E3-5, E4-1, E4-2, E5-1, E5-2, E5-4, E6-1, and E6-2*** of this permit. A summary report of this data is acceptable, provided there is sufficient information to enable the Technical Secretary to evaluate compliance.

(2) The MACT reports required by 40 CFR 63 Subparts A and FFFF (Condition ***E2-8***).

(3) The NSPS reports required by 40 CFR 60 Subparts A, Kb, VV, NNN, and RRR (Condition ***E2-7***).

Note to Condition E2-1(a)(3): Report the results of alternative monitoring (quarterly audible, visual, or olfactory inspections) with the NSPS VV report.

(4) Per the opacity matrix dated September 11, 2013 (Attachment 1), no visible emissions evaluation readings are required by Condition ***E2-5*** of this permit.

(5) Identification of all instances of deviations from **ALL PERMIT REQUIREMENTS**.

These reports must be certified by a responsible official consistent with condition B4 of this permit and shall be submitted to The Technical Secretary at the address in Condition E2(b) of this permit.

TAPCR 1200-03-09-.02(11)(e)1.(iii)

(b) **Annual compliance certification.** The permittee shall submit annually compliance certifications with each term or condition contained in Sections A, B, D and E of this permit, including emission limitations, standards, or work practices. This compliance certification shall include all of the following (provided that the identification of applicable information may cross-reference the permit or previous reports, as applicable):

(1) The identification of each term or condition of the permit that is the basis of the certification;

(2) The identification of the method(s) or other means used by the owner or operator for determining the compliance status with each term and condition during the certification period; Such methods and other means shall include, at a minimum, the methods and means required by this permit. If necessary, the owner or operator also shall identify any other material information that must be included in the certification to comply with section 113(c)(2) of the Federal Act, which prohibits knowingly making a false certification or omitting material information;

(3) The status of compliance with each term or condition of the permit for the period covered by the certification, including whether compliance during the period was continuous or intermittent. The certification shall be based on the method or means designated in E2(b)2 above. The certification shall identify each deviation and take it into account in the compliance certification. The certification shall also identify as possible exceptions to compliance any periods during which compliance is required and in which an excursion* or exceedance** as defined below occurred; and

(4) Such other facts as the Technical Secretary may require to determine the compliance status of the source.

* "Excursion" shall mean a departure from an indicator range established for monitoring under this paragraph, consistent with any averaging period specified for averaging the results of the monitoring.

** "Exceedance" shall mean a condition that is detected by monitoring that provides data in terms of an emission limitation or standard and that indicates that emissions (or opacity) are greater than the applicable emission limitation or standard (or less than the applicable standard in the case of a percent reduction requirement) consistent with any averaging period specified for averaging the results of the monitoring.

Annual compliance certifications shall cover the 12-month period from **July 1** of each calendar year to **June 30** of the following calendar year and shall be submitted within 60 days after the end of each 12-month period. The first annual compliance certification following issuance of this permit shall cover the following permits and reporting periods:

Permit Number	Reporting Period
567676	July 1 through December 31, 2019
574994	January 1 through June 30, 2020

These certifications shall be submitted to: **TN APCD** and **EPA**

The Technical Secretary
Division of Air Pollution Control
East Tennessee Permit Program

And

Air Enforcement and Toxics Branch
U. S. EPA Region 4
61 Forsyth Street, SW

William R. Snodgrass Tennessee Tower **Atlanta, Georgia 30303**
312 Rosa L Parks Avenue, 15th Floor
Nashville, TN 37243
e-mail (PDF): Air.Pollution.Control@tn.gov

40 CFR Part 70.6(c)(5)(iii) as amended in the Federal Register Vol.79, No. 144, July 28, 2014, pages 43661 through 43667
TAPCR 1200-03-09-.02(11)(e)3.(v)

(c) **Retention of Records** All records required by any condition in Section E of this permit must be retained for a period of not less than five years. Additionally, these records shall be kept available for inspection by the Technical Secretary or the authorized representative.

TAPCR 1200-03-09-.02(11)(e)1.(iii)(II)II

E2-2. Conservation Vent Maintenance:

For storage or process vessels subject to emission limitations based upon TAPCR 1200-03-07-.07(2):

Where removal of a pressure relief device such as a conservation vent from a storage or process vessel would otherwise result in excess emissions, the owner or operator is permitted to remove the pressure relief device provided the following applicable conditions are met:

For vessels which under normal operating conditions vent to a downstream piece of process or control equipment, a pressure relief device may be removed for up to a five (5) day period of time for maintenance, replacement, calibration, or inspection, under the following conditions:

(a) Upward level movement of liquid within the vessel is restricted to ten percent of the vessel height during the period in which the pressure relief device is removed, or

(b) Emissions of air contaminants due to working losses and inert gas purge losses are restricted to 100 pounds per day as determined by standard engineering estimation methods during the period in which the pressure relief device is removed.

Emissions occurring during the period of time the pressure relief device is removed shall not be considered excess emissions.

E2-3. Identification of Responsible Official, Technical Contact, and Billing Contact

(a) The application that was utilized in the preparation of this renewal permit is dated September 20, 2018 and is signed by Arnaud Thermoz-Lorciere, Managing Director, Primester GP. If this person terminates employment or is assigned different duties and is no longer a Responsible Official for this facility as defined in TAPCR 1200-03-09-.02(11)(b)21, the owner or operator of this air contaminant source shall notify the Technical Secretary of the change. Said notification must be in writing and must be submitted within 30 days of the change. The notification shall include the name and title of the new Responsible Official and certification of truth and accuracy. All representations, agreement to terms and conditions, and covenants made by the former Responsible Official that were used in the establishment of the permit terms and conditions will continue to be binding on the facility until such time that a revision to this permit is obtained that would change said representations, agreements, and/or covenants.

(b) The application that was utilized in the preparation of this renewal permit is dated September 20, 2018 and identifies Bret Beach as the Principal Technical Contact for the permitted facility. If this person terminates employment or is assigned different duties and is no longer the Principal Technical Contact for this facility, the owner or operator of this air contaminant source shall notify the Technical Secretary of the change. Said notification must be in writing and must be submitted within 30 days of the change. The notification shall include the name and title of the new Principal Technical Contact and certification of truth and accuracy.

(c) The application that was utilized in the preparation of this renewal permit is dated September 20, 2018 and identifies Dawn Warren as the Billing Contact for the permitted facility. If this person terminates employment or is assigned different duties and is no longer the Billing Contact for this facility, the owner or operator of this air contaminant source shall notify the Technical Secretary of the change. Said notification must be in writing and must be submitted

within 30 days of the change. The notification shall include the name and title of the new Billing Contact and certification of truth and accuracy.

E2-4. Recordkeeping: Data Entry Requirements

(a) For monthly recordkeeping, all data, including results of all calculations, must be entered into the log no later than 30 days from the end of the month for which the data is required.

(b) For weekly recordkeeping, all data, including results of all calculations, must be entered into the log no later than 14 days from the end of the week for which the data is required.

(c) For daily recordkeeping, all data, including results of all calculations, must be entered into the log no later than 14 days from the end of the day for which the data is required.

TAPCR 1200-03-10-.02(1)(a)

E2-5. Opacity Limits, Visible Emissions Evaluation

Visible emissions all emission sources subject to this permit shall not exceed 20% opacity except for one six-minute period in any one hour and for no more than four six-minute periods in any 24-hour period as per TAPCR 1200-03-05-.03(6) and 1200-03-05-.01(1). Visible emissions shall be determined by EPA Method 9 as set forth in the current 40 CFR 60, Appendix A, (six-minute average)

Compliance Method: Compliance with this condition shall be assured by the procedures of the Opacity Matrix Decision Tree for Visible Emission Evaluation, amended September 11, 2013 (Attachment 1). Visible emissions evaluations are not required for the following sources (**Table E2-4**):

Table E2-4: Sources not Requiring a Visible Emission Reading per the Opacity Matrix

Source Number	Description	Opacity Matrix Exemption
82-0510-01	B-440-1 Ester Production	Allowable emissions ≤ 10 tons/year for all pollutants
82-0510-02	B-441-1 Acid Recovery Process	Allowable emissions ≤ 10 tons/year for all pollutants
82-0510-03	B-441-2 Cellulose Scrap Recovery Process	Allowable emissions > 10 tons/year for colorless pollutants only (CO)
82-0510-04	B-442-1 Tank Farm	Allowable emissions ≤ 10 tons/year for all pollutants
82-0510-05	B-447-1 Cooling Towers	Allowable emissions ≤ 10 tons/year for all pollutants

For all emission sources that use opacity matrix decision trees (Attachment 1) to comply with any visible emissions requirement, including emission sources for which visible emissions are not required by the opacity matrix, if the magnitude and frequency of excursions reported by the permittee in the periodic monitoring for emissions is unsatisfactory to the Technical Secretary, this permit may be reopened to impose additional opacity monitoring requirements.

TAPCR 1200-03-05-.03(6) and 1200-03-05-.01(1), TAPCR 1200-03-10-.02(1)(a)

E2-6. Quarterly and Annual Leak Inspection

Quarterly or annual leak inspections shall be performed as follows:

(a) (1) **Quarterly Leak Inspection:** A leak inspection of all equipment in air contaminant service (contains or contacts a process fluid that is at least 10% air contaminant by weight) that is not "in heavy liquid service" or "in vacuum service" shall be performed once per calendar quarter. For this inspection, detection methods incorporating sight (e.g. looking for drips), sound (e.g. hissing sounds indicative of a leak), or smell (e.g. strong odors traceable to piping leaks) shall be used as appropriate. "Equipment" includes piping, pumps,

compressors, pressure relief devices, sampling connection systems, open-ended valves or lines, valves, and flanges. "In heavy liquid service" means when less than 20 weight percent of the process fluid consists of air contaminants having pure component vapor pressures greater than 0.044 psia at 68 degrees F, and the process fluid is not in the gaseous state at operating conditions. "In vacuum service" means equipment that is operating at an internal pressure that is at least 0.7 psia below ambient pressure. Equipment that is covered by insulation or obstructed from sight when standing on existing floors or walkways is exempt from this inspection. Equipment that is subject to a federally required work practice standard (e.g. 40 CFR Part 60, Subpart VV, 40 CFR Part 63, Subpart H, 40 CFR Part 265, Subpart BB) is exempt from this inspection. Equipment that is in air contaminant service less than 300 hours in a calendar quarter is exempt from this inspection for that quarter.

(2) **Annual Leak Inspection**: A leak inspection of all equipment in air contaminant service (contains or contacts a process fluid that is at least 10% air contaminant by weight) that is not "in heavy liquid service" or "in vacuum service" shall be performed once per calendar year. For this inspection, detection methods incorporating sight (e.g. looking for drips), sound (e.g. hissing sounds indicative of a leak), or smell (e.g. strong odors traceable to piping leaks) shall be used as appropriate. "Equipment" includes piping, pumps, compressors, pressure relief devices, sampling connection systems, open-ended valves or lines, valves, and flanges. "In heavy liquid service" means when less than 20 weight percent of the process fluid consists of air contaminants having pure component vapor pressures greater than 0.044 psia at 68 degrees F, and the process fluid is not in the gaseous state at operating conditions. "In vacuum service" means equipment that is operating at an internal pressure which is at least 0.7 psia below ambient pressure. Equipment that is covered by insulation or obstructed from sight when standing on existing floors or walkways is exempt from this inspection. Equipment that is subject to a federally required work practice standard (e.g. 40 CFR Part 60, Subpart VV, 40 CFR Part 63, Subpart H, 40 CFR Part 265, Subpart BB) is exempt from this inspection. Equipment that is in air contaminant service less than 720 hours in a calendar year is exempt from this inspection for that year.

(b) When a leak is detected, an initial attempt at repair shall be made no later than 10 calendar days after the leak is detected. Repair or replacement of leaking equipment shall be completed within 30 calendar days after detection of each leak, except as provided in paragraph (c) below.

(c) (1) Delay of repair of leaking equipment will be allowed if the repair is technically infeasible without a process unit shutdown or if repair personnel would be exposed to an immediate danger if attempting a repair without a process shutdown. Repair of this equipment shall occur by the end of the next process unit shutdown.

(2) Delay of repair of equipment for which leaks have been detected is allowed for equipment that is isolated from the process and that does not remain in air contaminant service.

(3) Delay of repair for valves, connectors, and agitators is also allowed if the owner or operator determines that emissions of purged material resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair.

(4) Delay of repair beyond a process unit shutdown will be allowed for a valve if valve assembly replacement is necessary during the process unit shutdown, valve assembly supplies have been depleted, and valve assembly supplies had been sufficiently stocked before the supplies were depleted. Delay of repair beyond the second process unit shutdown will not be allowed unless the third process unit shutdown occurs sooner than 6 months after the first process unit shutdown.

(5) Delay of repair of pumps for up to six months after leak detection is allowed if the pump is replaced with (i) a dual mechanical seal system, (ii) a pump with no externally actuated shaft penetrating the pump housing, or (iii) a new system that the permittee has determined will provide better performance.

(d) Recordkeeping Requirements

(1) Records must be maintained that identify piping systems or process areas subject to this plan.

(2) Records of all inspections must be kept documenting the inspection was conducted and the date of the inspection. If no leaks are detected during the inspection, the record must indicate this result.

(3) When a leak is detected, the following information shall be recorded:

(i) Component identifier or description of location and operator name, initials, or identification number.

(ii) The date the leak was detected.

(iii) The date the initial attempt at repair is made.

(iv) The date of successful repair of the leak. "Successful repair" means the leak is no longer detected using the inspection procedure outlined in item 10(a).

(v) "Repair delayed" and the reason for the delay if a leak is not repaired within 30 days after discovery of the leak.

TAPCR 1200-03-07-.07(2)

E2-7 (AA1). New Source Performance Standards (40 CFR Part 60)

This emission source is subject to the NSPS standards identified in **Table E2-7**:

Table E2-7: New Source Performance Standards (40 CFR Part 60)

NSPS Subpart	Rule	Applies to:
A	NSPS General Provisions	82-0510-01 82-0510-02 82-0510-03 82-0510-04
Kb	Standards of Performance for Volatile Organic Liquid Storage Vessels	82-0510-03 82-0510-04
VV	Standards of Performance for Equipment Leaks of VOC in the Synthetic Organic Chemicals Manufacturing Industry (SOCMI)	82-0510-01 82-0510-02 82-0510-03 82-0510-04
NNN	Standards of Performance for Volatile Organic Compound Emissions from Synthetic Organic Chemical Manufacturing Industry Distillation Operations	82-0510-01 82-0510-02 82-0510-03
RRR	Standards of Performance for Volatile Organic Compound Emissions from Synthetic Organic Chemical Manufacturing Industry Reactor Processes	82-0510-01 82-0510-02 82-0510-03

Compliance Method: A listing of specific applicability determinations for 40 CFR Parts 60 and 63 in effect as of the issuance date of this permit is found in Attachment 2. Compliance with this condition shall be assured by compliance with the specific requirements listed in Attachment 2. Changes that result in a change of applicability shall follow the applicable procedures in Section C of this permit and shall include an update to Attachment 2. The permittee shall comply with the applicable portions of the NSPS General Provisions as specified in 40 CFR 60 Subpart A.

TAPCR 1200-03-09-.03(8)

E2-8. National Emission Standards for Hazardous Air Pollutants for Source Categories (40 CFR Part 63)

This emission source is subject to the MACT standards identified in **Table E2-8**:

Table E2-8: MACT Standards (40 CFR Part 63)		
MACT Subpart	**Rule**	**Applies to:**
A	MACT General Provisions	82-0510-01 82-0510-04
FFFF	National Emission Standards for Hazardous Air Pollutants: Miscellaneous Organic Chemical Manufacturing	82-0510-01 82-0510-04

Compliance Method: A listing of specific applicability determinations for 40 CFR Parts 60 and 63 in effect as of the issuance date of this permit is found in Attachment 2. Compliance with this condition shall be assured by compliance with the specific requirements listed in Attachment 2. Changes that result in a change of applicability shall follow the applicable procedures in Section C of this permit and shall include an update to Attachment 2. The permittee shall comply with the applicable portions of the MACT General Provisions as specified in 40 CFR 63 Subpart A and/or the referencing Subparts.

TAPCR 1200-03-09-.03(8)

E2-9. Annual Certification of Compliance

Any emission unit or activity which is a subset of a process emission source, fuel burning installation, or incinerator, and which has a potential to emit less than 5 tons per year of a regulated air pollutant, by annual certification of compliance as required in item 1200-03-09-.02(11)(d)1.(ii)(I), shall be considered to meet the monitoring and related recordkeeping and reporting requirements of subpart 1200-03-09-.02(11)(e)1.(iii) and 1200-03-10-.04(2)(b)(1), and the compliance requirements of subpart 1200-03-09-.02(11)(e)3.(i) for that regulated air pollutant except where generally applicable requirements of the state implementation plan specifically impose monitoring and related record keeping and reporting requirements, or except where any applicable procedures and methods are required pursuant to rule 1200-03-10-.04. This provision shall not apply to emissions unit or activity that is subject to monitoring and related recordkeeping and reporting requirements under Chapters 1200-03-11 and 1200-03-31, and subparagraph 1200-03-02-.01(1)(dd).

E2-10. Periodic Monitoring Methods - General Requirements

(a) Includes all of the following:

(1) All emissions monitoring and analysis procedures or test methods required under the applicable requirements, including any procedures and methods promulgated pursuant to sections 114(a)(3) or 504(b) of the Federal Act.

(2) Those monitoring, recordkeeping, and reporting requirements prescribed by the Technical Secretary in accordance with the powers granted by TAPCR 1200-03-10.

(3) Where the applicable requirement does not require periodic testing or instrumental or noninstrumental monitoring (which may consist of recordkeeping designed to serve as monitoring), periodic monitoring sufficient to yield reliable data from the relevant time period that are representative of the source's compliance with the permit. These requirements assure use of such terms, test methods, units, averaging periods, and other statistical conventions consistent with the applicable requirements.

(4) Requirements concerning the use, maintenance, and installation of monitoring equipment or methods.

(b) No monitoring or recordkeeping is required during periods during which the source is not in operation.

(c) When the approved operating plan utilizes continuous parametric monitoring systems (CPMS), the permittee may use manual readings of the applicable parameter taken once per operating shift as a backup during periods of CPMS breakdown.

(d) For continuous monitoring systems, the following shall apply;

(1) The monitoring system shall measure data values at least once every 15 minutes.

(2) The owner or operator shall record either:

(A) Each measured value; or

(B) At least one measured value every 15 minutes; or

(C) Block average values for 15-minute or shorter periods calculated from all measured data values during each period or at least one measured data value per minute if measured more frequently than once per minute.

(e) Where the permit requires block averages or block totals for each continuously monitored parameter, the average or total shall be calculated as follows:

(i) 24-hour blocks shall begin at midnight of each day and end at midnight of the following day;

(ii) "Plant day" blocks shall begin at 6:30 AM of each day and end at 6:30 AM of the following day;

Averages shall be calculated as either the average of all values for a monitored parameter recorded during the 24 hour period or as the average of all valid one-hour averages for a monitored parameter recorded during the 24 hour period. If one-hour averages are used, they shall be calculated from four or more equally spaced data averages over each one-hour period, except during periods of monitoring system breakdown, monitoring system repairs, and periods of non-operation of the source. During these periods, a valid one-hour average shall consist of at least two 15-minute averages.

(f) Except as noted in **Condition E2-10(e)** (data requirements for valid one-hour averages), for a given averaging period, a valid average must include at least 75% percent of the measured values within the averaging period.

(g) Data recorded during periods of monitoring system breakdown, monitoring system repairs, and periods of non-operation of the source shall not be included in the data averages. Records of the times and durations of all such periods and any other periods during process or control device operation when monitors are not operating shall be retained at the source location and kept available for inspection by the Technical Secretary or authorized representative.

(h) If all valid measurements taken during an averaging period are within the applicable range for the parameter, calculation of an average value is not mandatory.

TAPCR 1200-03-09-.02(11)(e)(iii)(I), 1200-03-10-.02(1)(a)

E2-11. Excursions

(a) An excursion means a departure from an indicator range established for monitoring by this Title V permit, consistent with any averaging period specified for averaging the results of the monitoring, or,

(b) Operation of each air contaminant source shall be in accordance with the provisions and stipulations set forth in the operating permit, all provisions of TAPCR 1200-03 and 0400-30, and all provisions of the Tennessee Air Quality Act. Some excursions, as defined under TAPCR1200-03-09-.02(11)(b)31 or in the operating permit and which occur during periodic monitoring for compliance assurance, may be excused by the Technical Secretary. This authority is not extended to excursions that demonstrate noncompliance with an applicable emission limitation.

(c) Monitoring methods must have at least a 95% operational availability during each semiannual reporting period. Missing data in excess of these levels shall be grounds for enforcement action. Each operational availability of less

than 100%, and each missing or invalid averaging period, must be identified in the semiannual report required by **Condition E2-1** of this permit**.**

TAPCR 1200-03-09-.02(6), 1200-03-09-.02(11)(e)(iii)(I), 1200-03-10-.02(1)(a), 1200-03-10-.04(2)(a)

E2-12. General Requirements for Quarterly, Semiannual, and Annual Periodic Monitoring

Except as specifically indicated otherwise within this permit (or by an applicable requirement referenced within this permit), the following requirements shall apply to periodic monitoring, recordkeeping, or testing.

(a) Quarterly monitoring shall be completed at least once during each calendar quarter (January 1 through March 31 of each calendar year, April 1 through June 30 of each calendar year, July 1 through September 30 of each calendar year, and October 1 through December 31 of each calendar year).

(b) Semiannual monitoring shall be completed at least once during each calendar semiannual period corresponding to the semi-annual reporting periods specified in **Condition E2-1(a)** of this permit.

(c) Annual monitoring shall be completed at least once per each 12-month period corresponding to the annual reporting period specified in **Condition E2-1(b)** of this permit.

(d) Periodic monitoring may be delayed for equipment that is out of service for an extended period, as follows:

(1) For quarterly periodic monitoring, if equipment is out of service for at least 45 consecutive days during the calendar quarter, periodic monitoring must be completed within 90 operating days of the previous monitoring event.

(2) For semiannual periodic monitoring, if equipment is out of service for at least 90 consecutive days during the calendar semiannual period, periodic monitoring must be completed within 180 operating days of the previous monitoring event.

(3) For annual periodic monitoring, if equipment is out of service for at least 180 consecutive days during the calendar year, periodic monitoring must be completed within 365 operating days of the previous monitoring event.

TAPCR 1200-03-09-.02(11)(e)(iii)(I), 1200-03-10-.02(1)(a)

E2-13. Reference Test Methods

(a) If required by an applicable requirement or requested by the Technical Secretary pursuant to TAPCR 1200-10-.01(2), compliance with emission limits shall be determined by performance testing in accordance with the appropriate EPA test methods, as published in the current 40 CFR 60, Appendix A, or as otherwise specified in the applicable requirement.

(b) Performance tests shall be conducted and data reduced in accordance with the test methods and procedures listed in paragraph (a), unless the Technical Secretary approves the use of an equivalent or alternative method, or approves shorter sampling times and smaller sample volumes when necessitated by process variables or other factors.

(c) Performance tests shall be conducted under such conditions as the Technical Secretary shall specify to the plant operator based on representative performance of the affected facility. The owner or operator shall make available to the Technical Secretary such records as may be necessary to determine the conditions of the performance tests. Operations during periods of startup, shutdown, and malfunction shall not constitute representative conditions for the purpose of a performance test.

(d) The owner or operator of an affected facility shall provide the Technical Secretary at least 30 days prior notice of any performance test to afford the Technical Secretary the opportunity to have an observer present. The Technical Secretary may waive the right to such prior notice.

(e) The owner or operator of an affected facility shall provide, or cause to be provided, performance testing facilities as follows:

(1) Sampling ports adequate for test methods applicable to such facility. This includes (i) constructing the air pollution control system such that volumetric flow rates and pollutant emission rates can be accurately determined by applicable test methods and procedures and (ii) providing a stack or duct free of cyclonic flow during performance tests, as demonstrated by applicable test methods and procedures.

(2) Safe sampling platform(s).

(3) Safe access to sampling platform(s).

(4) Utilities for sampling and testing equipment.

(f) Unless otherwise specified in the applicable requirement, each performance test shall consist of three separate runs using the applicable test method. For the purpose of determining compliance with an applicable standard, the arithmetic means of results of the three runs shall apply. In the event that a sample is accidentally lost or conditions occur in which one of the three runs must be discontinued because of forced shutdown, failure of an irreplaceable portion of the sample train, extreme meteorological conditions, or other circumstances, beyond the owner or operator's control, compliance may, upon the Technical Secretary's approval, be determined using the arithmetic mean of the results of the two other runs.

(g) Where performance testing is technically infeasible or otherwise not specified by the permit, an engineering assessment, consisting of material or energy balances, emission factors, vapor-liquid equilibria, or other appropriate calculations, may be used to calculate emissions from an emission source or vent.

TAPCR 1200-03-10-.01

E2-14. Confidential Business Information: The application dated September 2, 2018 includes confidential business information. A copy of all confidential business information shall be maintained at the source location and made available for inspection by the Technical Secretary or the authorized representative.

E2-15. Emissions Inventory Requirements (State-Only): The permittee shall submit emissions inventories in accordance with Rule 1200-03-10-.05.

82-0510-01	**B-440-1 Ester Production:** B-440-1 consists of hammermill, activation, acetylation, hydrolysis, and precipitation/maturation operations, and associated storage and process tanks. Acetic acid, acetic anhydride, sulfuric acid, and cellulose are introduced at different points in the process to convert cellulose to cellulose acetate. The manufacturing process is continuous. This process also results in cellulose sludge that is recovered for degradation at Source 82-0510-03 to a wastewater that is transported offsite for further treatment and disposal. Particulate matter emissions are controlled by two baghouses (ACY-15 and ACY-25), and VOC emissions are controlled by six wet scrubbers (ACC-10, ACC-12, CHC-13, FPC-12, UTD-30, and UTD-40). Fugitive VOC emissions from piping component leaks occur at this source (Flow Diagram Point F).

Conditions E3-1 through E3-6 apply to 82-0510-01

E3-1. Particulate matter emitted from this source shall not exceed the following limits:

(a) Particulate matter emitted from Vents B, C, G, and H shall not exceed 0.13 pounds per hour.

(b) Particulate matter emitted from this source shall not exceed 1.6 tons during any period of twelve consecutive months.

Compliance Method: Annual certification of compliance in accordance with **Condition E2-9**.

TAPCR 1200-03-07-.01(5), Condition 7 of permit number 741379P, letter dated May 18, 2016

E3-2. Carbon monoxide (CO) emitted from Vent C shall not exceed 0.21 pounds per hour.

Compliance Method: Annual certification of compliance in accordance with **Condition E2-9**.

TAPCR 1200-03-07-.07(2), Condition 12 of permit 741379P

E3-3. Volatile organic compounds (VOC) emitted from this source shall not exceed the following limits:

(a) VOC emitted from Vents A, B, C, D, E, and N shall not exceed 1.85 pounds per hour (24-hour block average).

(b) VOC emitted from Vent Q (Tank CAD-40) shall not exceed 0.04 tons during any period of twelve consecutive months.

(c) VOC emitted from this source (entire source, excluding fugitive equipment leaks) shall not exceed 8.1 tons during any period of twelve consecutive months.

Compliance Method: Compliance with this condition shall be assured as shown in **Table E3-3**.

Table E3-3: Compliance Methods for VOC Emission Limit

Vent ID	Compliance Method
A, B, C, D, E, and N	The daily production rate of cellulose acetate (24-hour plant day total) shall not exceed the rate specified in the application dated September 20, 2018, page B-25. The production rate shall be calculated from the total cellulose consumption for each plant day.
A	A minimum scrubber flow rate of 1.5 gallons per minute (24-hour block average) shall be maintained for Scrubber ACC-10. The scrubber water flow rate shall be continuously monitored and recorded.
B	A minimum scrubber flow rate of 1.5 gallons per minute (24-hour block average) shall be maintained for Scrubber ACC-12. The scrubber water flow rate shall be continuously monitored and recorded.
C	A minimum scrubber flow rate of 5 gallons per minute (24-hour block average) shall be maintained for Scrubber CHC-13. The scrubber water flow rate shall be continuously monitored and recorded.

Table E3-3: Compliance Methods for VOC Emission Limit	
Vent ID	**Compliance Method**
D and E	A minimum scrubber pH of 7.0 (24-hour block average) shall be maintained for Scrubbers UTD-30 (Vent D) and UTD-40 (Vent E). The pH of each scrubber shall be continuously monitored and recorded when in use.
N	Comply with **Condition E3-5** (Compliance Assurance Monitoring).
Q	Annual certification of compliance in accordance with **Condition E2-9**.

TAPCR 1200-03-07-.07(2), Condition 9 of permit 741379P

E3-4 (AA1). The permittee shall perform annual leak inspections for Flow Diagram Point F (fugitive equipment leaks) in accordance with **Condition E2-6** of this permit. Fugitive VOC emissions from pumps, valves, flanges, closed vent systems, and control devices are estimated at 2.7 tons/year.

TAPCR 1200-03-07-.07(2)

E3-5. This emission source is subject to 40 CFR Part 64 (Compliance Assurance Monitoring) as indicated in **Table E3-5**:

Table E3-5: Compliance Assurance Monitoring (40 CFR Part 64)	
NSPS Subpart	**Rule**
C	Exempt per §64.2(b)(1)(i) (exempt emission limitations or standards proposed by the Administrator after November 15, 1990 – Vent subject to Group 1 MACT control requirements).
N	See Attachment 3.

Compliance Method: Compliance with this condition shall be assured by compliance with the specific requirements listed in Attachment 3.

E3-6. **State-only condition:** Halogenated refrigerant emissions from equipment leaks (Flow Diagram Point F) shall not exceed 4.0 tons during any period of twelve consecutive months.

Compliance Method: Not Applicable - this condition does not implement relevant requirements of the Federal Act and therefore is not an applicable requirement under the Federal Act.

82-0510-02	**B-441-1 Acid Recovery Process:** B-441-1 consists of extractors, distillation columns, decanters, and solvent storage and process vessels used to recover acetic acid. Acid is processed in solvent extractors to migrate acetic acid from the spent solution into the extractor solvent. The acetic acid is then separated from the extraction solvent by an azeotropic distillation column. A two-scrubber system (Scrubbers ARC-11 and ARC-12) is used to control VOC for the acid recovery source. Scrubber ARC-11's scrubbing medium is approximately 30% acetic acid. ARC-11 exhausts directly into Scrubber ARC-12 which is a water scrubber. ARC-12 exits through emission point A. Fugitive VOC emissions from piping components occur at this source (Flow Diagram Point B).

Conditions E4-1 and E4-2 apply to 82-0510-02

E4-1. Volatile organic compounds (VOC) emitted from this source shall not exceed the following limits:

(a) VOC emitted from Vent A shall not exceed 0.1 pounds per hour (24-hour block average).

(b) VOC emitted from Vent D shall not exceed 2.36 tons during any period of twelve consecutive months.

(c) VOC emitted from this source (entire source, excluding fugitive equipment leaks) shall not exceed 2.8 tons during any period of twelve consecutive months.

Compliance Method: Compliance with this condition shall be assured as shown in **Table E4-1**.

Table E4-1: Compliance Methods for VOC Emission Limit	
Vent ID	**Compliance Method**
A, B, C, D, E, and N	The daily production rate of acetic acid (24-hour block total) shall not exceed the rate specified in the application dated September 20, 2018, page B-90. The production rate shall be continuously monitored and recorded.
A	A minimum scrubber flow rate (30% solution of acetic acid) of 10 gallons per minute shall be maintained for Scrubber ARC-11, and a minimum scrubber flow rate (water) of 0.8 gallons per minute shall be maintained for Scrubber ARC-12 (24-hour block average for each scrubber). The scrubber flow rates shall be continuously monitored and recorded.
C	Annual certification of compliance in accordance with **Condition E2-9**.
D	A log will be maintained of the time that Vent D (bypass stack for Vent A) operates while the process continues to operate. The bypass vent shall be operated no more than 48 hours per year.

TAPCR 1200-03-07-.07(2), construction permits 738842P and 955108P

E4-2 (AA1). The permittee shall perform quarterly leak inspections for Flow Diagram Point B (fugitive equipment leaks) in accordance with **Condition E2-6** of this permit. Fugitive VOC emissions from pumps, valves, flanges, closed vent systems, and control devices are estimated at 9.1 tons/year.

TAPCR 1200-03-07-.07(2)

82-0510-03	**B-441-2 Cellulose Scrap Recovery Process:** Reject dope from various points in the acetylation operation at ESRN 82-0510-01 is processed at this source for recovery of cellulose sludge. Materials are recovered from this stream at the distillation columns for reuse at the plant. Once the recoverable materials are removed from the cellulose sludge, it is processed in heated and pressurized reactors in the presence of sulfuric acid to degrade the sludge into smaller solids for subsequent management offsite at an NPDES wastewater treatment plant. VOC and sulfur dioxide are emitted from the equipment and conveyors at this source. This source uses Scrubber SRC-23 to control VOC. The scrubber exhausts through emission point C (Scrubber SRC-23). Among the controlled equipment are Storage Tanks SRD-40 & SRD-70. The scrubbing medium used in SRC-23 is a water solution with caustic added. Fugitive VOC emissions from piping components occur at this source (Flow Diagram Point B).

Conditions E5-1 through E5-4 apply to 82-0510-03

E5-1. Sulfur dioxide (SO_2) emitted from Vent C shall not exceed the following limits:

(a) 1,000 parts per million, 0.10 percent by volume, dry basis (one hour average); and

(b) 0.25 pounds per hour (three-hour average).

Compliance Method: A minimum scrubber flow rate of 1.0 gallons per minute (3-hour moving average) and a minimum scrubber pH of 6.0 (24-hour block average) shall be maintained for Scrubber SRC-23. The scrubber flow rate and pH shall be continuously monitored and recorded.

TAPCR 1200-03-14-.03(5) and 1200-03-14-.03(2)

E5-2. Carbon monoxide (CO) emitted from this source (entire source, excluding fugitive equipment leaks) shall not exceed 8.76 pounds per hour (24-hour block average) and 38.4 tons during any period of twelve consecutive months.

Compliance Method: The process material input rate for this source (cellulose sludge) shall not exceed the rate specified in the application dated September 20, 2018, page B-116 (24-hour plant day total). The process material input rate shall be continuously monitored and recorded.

TAPCR 1200-03-07-.07(2), construction permit 952963P

E5-3. Volatile organic compounds (VOC) emitted from this source shall not exceed the following limits:

(a) VOC emitted from Vent C shall not exceed 0.14 pounds per hour.

(b) VOC emitted from this source (entire source, excluding fugitive equipment leaks) shall not exceed 0.6 tons during any period of twelve consecutive months.

Compliance Method: Annual certification of compliance in accordance with **Condition E2-9**.

TAPCR 1200-03-07-.07(2), construction permit 952963P

E5-4 (AA1). The permittee shall perform quarterly leak inspections for Flow Diagram Point B (fugitive equipment leaks) in accordance with **Condition E2-6** of this permit. Fugitive VOC emissions from pumps, valves, flanges, closed vent systems, and control devices are estimated at 10.44 tons/year.

TAPCR 1200-03-07-.07(2), construction permits 952963P and 955108P

82-0510-04	**B-442-1 Tank Farm:** VOC emissions from storage tanks are vented to water Scrubber CAC-15 or to acid Scrubber CAC-14, which vents to Scrubber CAC-15. The acid scrubber uses approximately a 30% acetic acid solution as a scrubbing medium. Storage Tank CAD-30 which contains a strong acid is uncontrolled. CHD-60 (caustic solution) is also uncontrolled. Fugitive VOC emissions from transfer rack and piping component leaks occur at this source (Flow Diagram Point B).

Conditions E6-1 and E6-2 apply to 82-0510-04

E6-1. Volatile organic compounds (VOC) emitted from this source shall not exceed the following limits:

(a) VOC emitted from Vent A shall not exceed 3.9 tons during any period of twelve consecutive months.

(b) The VOC scrubbers associated with Vent A (water scrubber CAC-15 or combination of acid scrubber CAC-14 and water scrubber CAC-15) shall maintain a 97% control efficiency at the control device design ratings.

Compliance Method: A minimum scrubber flow rate (30% solution of acetic acid) of 4 gallons per minute shall be maintained for Scrubber CAC-14, and a minimum scrubber flow rate (water) of 1.8 gallons per minute shall be maintained for Scrubber CAC-15 (24-hour block average for each scrubber). The scrubber flow rates shall be continuously monitored and recorded.

During Acid Recovery shutdowns, the acid flow to Scrubber CAC-14 will be turned off, but the water flow to Scrubber CAC-15 will continue to absorb acetic acid vapors. Although the process will not be operating during these periods, the tanks will continue to store inventory. Therefore, there will be minimal emissions from breathing and purge losses from tanks SVD-02 and SVD-04 during these periods. Scrubber CAC-14 and/or CAC-15 may also be bypassed for up to 200 hours per calendar year with the process operating for scrubber cleaning or maintenance. These events when scrubber flows must be terminated or scrubbers bypassed shall not be considered parameter excursions as defined in **Condition E2-11**. A record of bypass hours for Scrubbers CAC-14 and CAC-15 shall be maintained at the source location and made available for inspection by the Technical Secretary or the authorized representative.

TAPCR 1200-03-07-.07(2), operating permit 038920, and construction permits 954289P and 955108P

E6-2 (AA1). The permittee shall perform quarterly leak inspections for Flow Diagram Point B (fugitive equipment leaks) in accordance with **Condition E2-6** of this permit. Fugitive VOC emissions from pumps, valves, flanges, closed vent systems, and control devices are estimated at 9.4 tons/year.

TAPCR 1200-03-07-.07(2), construction permits 952963P and 955108P

82-0510-05	**B-447-1 Cooling Towers:** A cooling tower is used to cool water for 82-0510-01, 82-0510-02, and 82-0510-03. Sulfuric acid, a water treatment chemical is stored in a 2,115 gallon storage tank and added to the water supply to the cooling towers. The cooling towers are a source of particulate matter from primarily dissolved solids naturally occurring in the water supply and water treatment chemicals. Sulfuric acid is a water additive, as is bleach and de-scaler that is mixed with the water en route to the cooling tower.

Conditions E7-1 and E7-2 apply to 82-0510-04

E7-1. Particulate matter emitted from this source shall not exceed the following limits:

(a) 1.62 pounds per hour; and

(b) 5.5 tons during any period of twelve consecutive months.

Compliance Method: Annual certification of compliance in accordance with **Condition E2-9**.

TAPCR 1200-03-07-.01(5), construction permit 952404P, letter dated May 18, 2016

E7-2. Volatile organic compounds (VOC) emitted from this source shall not exceed 0.2 tons during any period of twelve consecutive months.

Compliance Method: Annual certification of compliance in accordance with **Condition E2-9**.

TAPCR 1200-03-07-.07(2), construction permit 952404P

END OF ADMINISTRATIVE AMENDMENT #1 TO PERMIT NUMBER 574994

ATTACHMENT 1

OPACITY MATRIX DECISION TREE FOR VISIBLE EMISSION EVALUATION METHOD 9 DATED SEPTEMBER 11, 2013

Decision Tree PM for Opacity for Sources Utilizing EPA Method 9*

Notes:

PM = Periodic Monitoring required by 1200-03-09-.02(11)(e)(iii).

This Decision Tree outlines the criteria by which major sources can meet the periodic monitoring and testing requirements of Title V for demonstrating compliance with the visible emission standards set forth in the permit. It is not intended to determine compliance requirements for EPA's Compliance Assurance Monitoring (CAM) Rule (formerly referred to as Enhanced Monitoring – Proposed 40 CFR 64).

Examine each emission unit using this Decision Tree to determine the PM required.*

Use of continuous emission monitoring systems eliminates the need to do any additional periodic monitoring.

Visible Emission Evaluations (VEEs) are to be conducted utilizing EPA Method 9. The observer must be properly certified to conduct valid evaluations.

Typical Pollutants
Particulates, VOC, CO, SO_2, NO_x, HCl, HF, HBr, Ammonia, and Methane.

Initial observations are to be repeated within 90 days of startup of a modified source, if a new construction permit is issued for modification of the source.

A VEE conducted by TAPCD personnel after the Title V permit is issued will also constitute an initial reading.

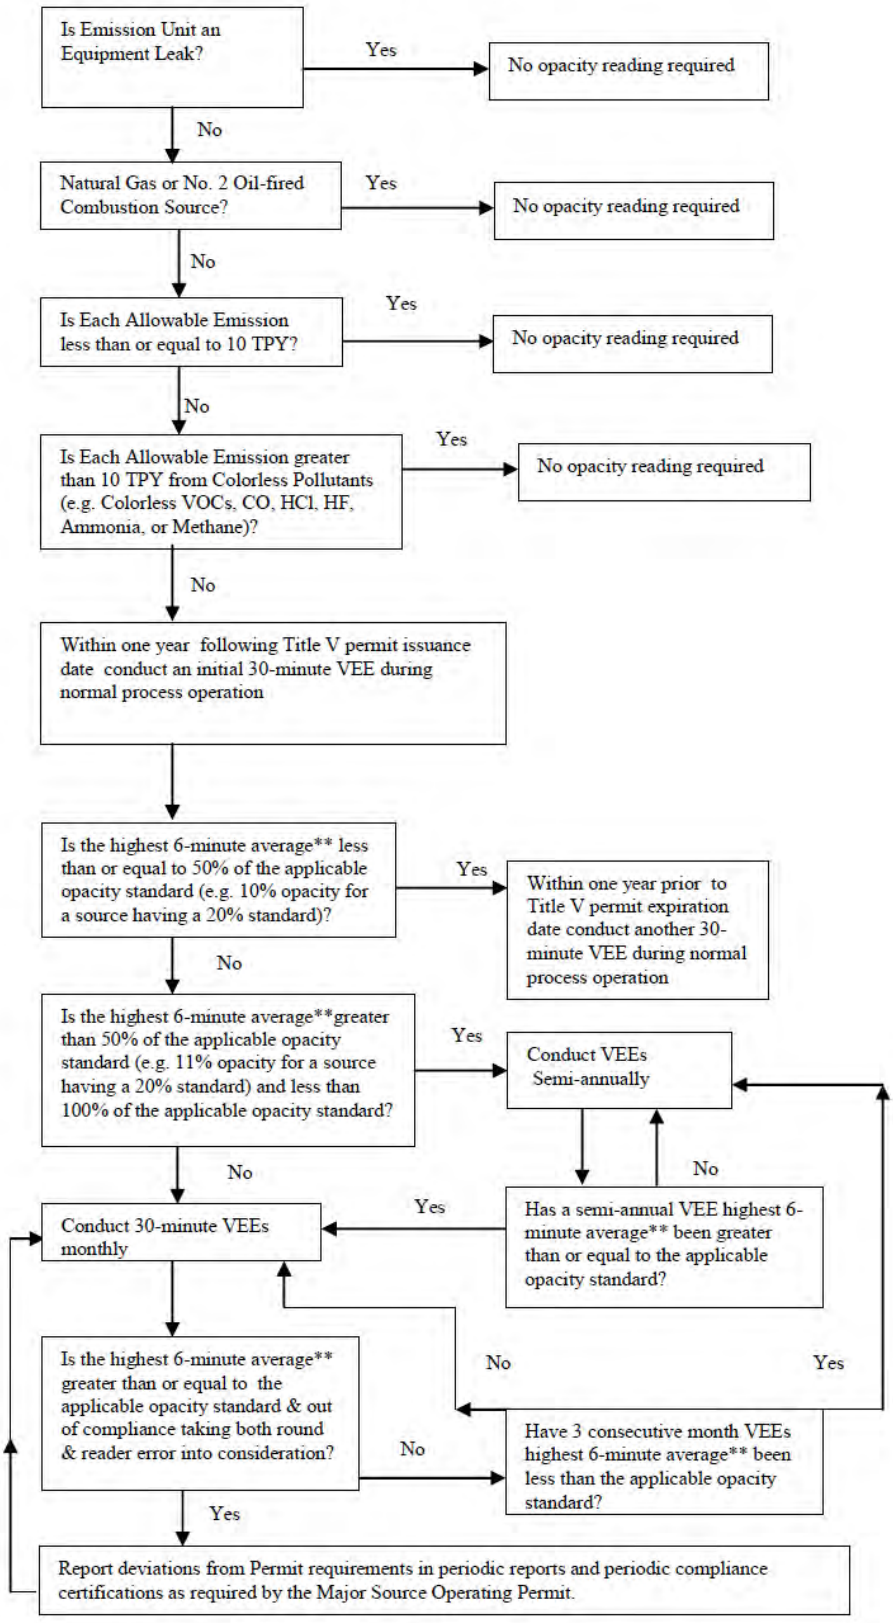
Reader Error
EPA Method 9, Non-NSPS or NESHAPS stipulated opacity standards:
The TAPCD guidance is to declares non-compliance when the highest six-minute average** exceeds the standard plus 6.8% opacity (e.g. 26.8% for a 20% standard).

EPA Method 9, NSPS or NESHAPS stipulate opacity standards:
EPA guidance is to allow only engineering round. No allowance for reader error is given.

*Not applicable to Asbestos manufacturing subject to 40 CFR 61.142

**Or second highest six-minute average, if the source has an exemption period stipulated in either the regulations or in the permit.

Dated June 18, 1996
Amended September 11, 2013



ATTACHMENT 2

SPECIFIC APPLICABILITY DETERMINATIONS FOR 40 CFR 60 (NSPS) AND 40 CFR 63 (MACT)

40 CFR Part 60 - Specific Applicability Determinations for 82-0510-01		
Identification	**Category**	**Rule Citation**
Subpart Kb – Storage Vessels		
Not applicable		
Subpart VV – Equipment Leaks		
Portions of Flow Diagram Point F	Work practice standards for pumps, compressors, pressure relief devices, sampling connection systems, open-ended valves or lines, etc.	40 CFR 60.482, 60.483
Portions of Flow Diagram Point F	Alternative monitoring for equipment in acetic acid service (letter from Beverly Banister, EPA Region 4, to Barry Stephens, TDAPC, January 23, 2004).*	40 CFR 60.60.13(i)
VV subject points as applicable	Recordkeeping and reporting	40 CFR 60.486, 60.487
Subpart III – Air Oxidation		
Not applicable		
Subpart NNN – Distillation		
Columns DCC-80/DCC-90, Column DCC-70, Column DCC-30	TRE less than or equal to 1.0 (Reduce TOC by 98% or to 20 ppmv)	40 CFR 60.662(a)
NNN subject points as applicable	Monitoring, recordkeeping, and reporting	40 CFR 60.663, 60.665
Subpart RRR – Reactors		
Reactors CAC-01, CAC-02, CAC-03, CAC-04, CHC-10, CHC-20, CHC-30, CHC-40, CHC-50 (Vent B)	Low Flow Exemption	40 CFR 60.700(c)(4)
RRR subject points as applicable	Monitoring, recordkeeping, and reporting	40 CFR 60.703, 60.705

* See Appendix E of the Title V renewal application dated September 20, 2018, for the Alternative Monitoring Plan for equipment in acetic acid service.

40 CFR Part 63 Subpart FFFF (MON) – Specific Applicability Determinations for 82-0510-01		
Identification	**Category**	**Rule Citation**
Continuous Process Vents		
Columns DCC-80/DCC-90, Column DCC-70, Column DCC-30	Group 1 Continuous Process Vent and Applicable Monitoring	§63.2455
Process Vents Emitting Hydrogen Halide or Halogen HAPs, Batch Process Vents, Storage Vessels, Transfer Operations		
Not applicable		
Equipment Leaks		
Flow Diagram Point F	Equipment in OHAP service complying with 40 CFR 63 Subpart H.	§63.2480(a)
Process Wastewater		
Underflow from Scrubber CHC-13 at the Hydrolysis Operation	Group 2 wastewater stream	§63.2485
Emissions averaging		
Not applicable		
Recordkeeping and Reporting		
MON Subpart FFFF points as applicable	Recordkeeping and reporting applicable MON emission points	§63.2520, §63.2525

MON Overlap Provisions – Specific Applicability Determinations for 82-0510-01				
Identification	**MON Category**	**Overlap**	**Compliance Requirement**	**Rule Citation**

Pursuant to TAPCR 1200-03-09-.02(11)(e)6(i)(II), the Technical Secretary has determined that the requirements of 40 CFR 60 Subpart Kb do not apply to the following tanks: SVD-01, SVD-02, and SVD-04. These vessels were previously included as affected equipment in the Title V Operating Permit. SVD-02 and SVD-04 are exempt pursuant to §60.111b ("storage tanks", as defined by Subpart Kb, do not include process vessels). SVD-01 is exempt pursuant to §60.110b(b) (storage vessels with a capacity greater than or equal to 151 m^3 storing a liquid with a maximum true vapor pressure less than 3.5 kPa).

Dear Mr. Stephens:

The purpose of this letter is to provide you with a determination regarding an alternative monitoring approach proposed by the Eastman Chemical Company (Eastman) in the enclosed letter dated December 4, 2003. Eastman's proposal is for equipment that is subject to 40 CFR Part 60, Subpart VV (Standards of Performance for Equipment Leaks of Volatile Organic Compounds (VOC) in the Synthetic Organic Chemicals Manufacturing Industry) at the company's Kingsport, Tennessee plant. In its plan, Eastman proposed to use sensory means (i.e., sight, sound, and smell) as an alternative to the U.S. Environmental Protection Agency (EPA) Method 21 for identifying leaks from equipment that is in acetic acid service. Based upon our review of monitoring results provided by Eastman, we concluded that leaks from equipment in acetic acid service at the company's Kingsport plant can be more easily identified through sensory methods than by using Method 21. Therefore, the company's alternative monitoring proposal is acceptable to Region 4. It will be necessary, however, for the company to increase the monitoring frequency for light liquid pumps covered by its proposal. Details regarding Eastman's proposal and the basis for our determination are provided in the remainder of this letter.

The types of equipment covered by the leak detection and repair standards in Subpart VV are pumps, compressors, pressure relief devices, sampling connection systems, open-ended valves or lines, and connectors. Under this regulation, owners/operators are required to periodically monitor equipment in VOC service. When leaks are detected, a first attempt at repair must be initiated within five days, and repairs must be completed within 15 days. The two primary methods of detecting leaks under Subpart VV are either using an instrumental analyzer that satisfies performance requirements in EPA Method 21 or using sensory methods that identify leaks through visual, audible, or olfactory means. In its alternative monitoring plan, Eastman proposed to use sensory methods to identify leaks for some types of equipment (pumps and valves) in acetic acid service where Subpart VV requires the use of EPA Method 21. Under Eastman's proposal, equipment that contains or contacts a process fluid that is at least ten percent

Internet Address (URL) • http://www.epa.gov
Recycled/Recyclable • Printed with Vegetable Oil Based Inks on Recycled Paper (Minimum 25% Postconsumer)

acetic acid by weight while having a VOC content of less than ten percent for all other organic compounds would be classified as being in acetic acid service.

Included with Eastman's request for approval of its alternative monitoring approach was a summary of leaks that were detected for equipment in acetic acid service in the cellulose acetate production facility at the company's Kingsport plant. Between May 2002 and July 2003, there were four occasions when the VOC concentration measured with a Method 21 analyzer exceeded the 10,000 part per million threshold used for defining leaks under Subpart VV. In all four of these cases, the leaks detected using Method 21 were also detectable using sensory methods. During this same May 2002 through July 2003 time period, 51 additional leaks from equipment in acetic acid service at Eastman were detected through sensory methods even though Method 21 analyzer readings for the corresponding leaks were less than 10,000 ppm. Based upon the data that Eastman supplied, significantly more leaks for equipment in acetic acid service were detected through sensory techniques than by EPA Method 21. Since all four of the leaks identified using Method 21 between May 2002 and July 2033 would have also been detected through sensory techniques, using sensory techniques alone for equipment in acetic acid service would not have caused Eastman to miss any of the leaks found using an instrumental analyzer. Therefore, Eastman's proposal to use only sensory techniques to detect leaks from equipment in acetic acid service at its Kingsport plant is acceptable to EPA Region 4.

Leaks for the equipment covered by Eastman's alternative monitoring proposal are detected more readily with sensory techniques than with Method 21 due to the physical properties of acetic acid and the process conditions at the Kingsport plant. Among the physical properties that make it easier to detect leaks using sensory techniques are acetic acid's high boiling point (118 °C), its high corrosivity, and its low odor threshold. Because the operating temperature for the majority of the equipment covered by Eastman's alternative monitoring proposal is lower than the boiling point of acetic acid, leaks that do occur are typically present in the form of liquid drips that can be detected visually. Such drips tend to cause staining or rusting of metal components because of acetic acid's corrosivity, and this is another factor that allows operators to detect leaks visually. The low odor threshold for acetic acid also makes it possible for operators to readily identify and locate leaks using olfactory techniques.

Although using sensory techniques will be an acceptable alternative to using EPA Method 21 for detecting leaks from equipment in acetic acid leaks at Eastman, the proposed monitoring frequency for pumps in light liquid service must be increased. According to the alternative monitoring plan submitted by Eastman, all of the equipment subject to Subpart VV would be monitored for leaks using sensory techniques on a quarterly basis. Since Subpart VV requires that pumps in light liquid service be monitored visually on a weekly basis, changing to a quarterly monitoring frequency for this type of equipment would constitute a significant relaxation in the standard for pumps. Therefore, one condition for approval of Eastman's alternative monitoring plan is that it be revised to require that monitoring for pumps in light liquid service be conducted on at least a weekly basis.

If you have any questions about the determination provided in this letter, please contact Mr. David McNeal of the EPA Region 4 staff at (404) 562-9102.

Sincerely,

Carol L. Kemker for

Subject: NSPS Equivalence of Means for Equipment Leaks in Acetic Acid Service

Dear Mr. Neeley:

Please find enclosed an application for determination of equivalence of means of emission limitation submitted by Eastman Chemical Company (Eastman) pursuant to the provisions of 40 CFR 60.484.

Approval of this application would establish an alternative to certain work practices found in 40 CFR Part 60 Subpart VV that apply to equipment in acetic acid service at Eastman's Tennessee Operations site in Kingsport, Tennessee.

If there are any questions, concerning this application, please contact me at (423)229-2327.

Sincerely,

Stephen R. Gossett

Responsible Care:® A Public Commitment

Eastman Chemical Company
Application for Determination of Equivalence

For

Certain New Source Performance Standards
Leak Detection and Repair Program
for Equipment in Acetic Acid Service

Background

Eastman Chemical Company (Eastman) operates a chemical manufacturing facility in Kingsport, Tennessee (hereinafter referred to as "Tennessee Operations"). At this facility, several chemical manufacturing process units have triggered and comply with 40 CFR Part 60 Subpart VV, Standards of Performance for Equipment Leaks of VOC in the Synthetic Organic Chemicals Manufacturing Industry ("Subpart VV").

Several of the provisions of Subpart VV require equipment leak detection and repair programs for pumps, valves, and connectors. The specific sections are 40 CFR Sections 60.482-2, 60.482-4, 60.482-7, and 60-482-8 along with the applicable recordkeeping and reporting requirements of Sections 60.486 and 60.487. These provisions require leak detection for pumps in light liquid service and valves in gas/vapor or light liquid service to be done using an instrument known as Method 21 (see Section 60.485) to detect VOC. Method 21 is also required to verify that pressure relief devices are not leaking after a pressure release and to verify a leak and the successful leak repair of a pump or valve in heavy liquid service or a pressure relief device or connector found to be leaking by sensory methods (see 60.482-8). Subpart VV also requires weekly visual inspections of pumps and subsequent repair of any pump seals found dripping.

Eastman's experience applying these provisions to equipment in acetic acid service is that no leaks are detected using Method 21 that are not also observed using sensory methods (sight, sound, smell) to be leaking. In fact, most leaks we find using sensory methods do not meet the Subpart VV leak definition based on Method 21 readings. Subsequently, we believe a program based solely on sensory inspections will actually yield equivalent or superior emission reductions when compared to the Subpart VV program.

Therefore, Eastman requests the Administrator approve this application for a determination of equivalence of means of emission limitation pursuant to the provisions of 40 CFR Section 60.484.

Proposed Equivalent Work Practices

Eastman proposes as an alternative to the work practices required by 40 CFR Section 60.482-2, 40 CFR Section 60.482-4, 40 CFR Section 60.482-7, and 40 CFR Section 60.482-8, that all regulated equipment at any NSPS Subpart VV affected facility in "acetic acid service" at Eastman's Tennessee Operations site comply with a leak detection and repair program that identifies leaks using sensory (sight, sound, smell) methods. By acetic acid service we mean that the alternative work practice standard would apply to all regulated equipment otherwise subject to NSPS Subpart VV that contains or contacts a process fluid that is at least 10 percent acetic acid by weight but is comprised of less than 10 percent by weight of all other VOCs.

Eastman complies with sensory monitoring as part of its Title V permit compliance for process units not subject to a federally required equipment leak standard. For consistency at our site, we would propose these same work practice standards as the equivalent means of emission limitation. The detailed provisions found in our Title V permits are included as Attachment 1.

Demonstration of Equivalence (40 CFR Sections 60.484(c)(1), (2), and (3))

To support our proposal, we have collected data from our Cellulose Acetate production unit (PES B-440-1) and associated acetic acid recovery operations (PES B-441-1 and B-441-2), which are subject to Subpart VV. This data is shown in Attachment 2. From May 2002 through July 2003, each leak found either using sensory methods or by using Method 21was logged. This includes required weekly pump visual inspections as well as any leak found using sensory methods during this time period, whether it was a required NSPS inspection or not. Note that NSPS Subpart VV does not require repair of valves in gas-vapor or light liquid service found leaking using visual observation.

Each leak found using sensory methods was monitored using Method 21 to determine its leak concentration. Using correlation equations found in Table 2 of EPA's Protocol for Equipment Leak Emission Estimates (June 1993), equivalent kg/hr leak rates were determined for each leak.

This data shows that, for this population of equipment in acetic acid service, only 16% of the leak rate (0.089 kg/hr out of 0.542 kg/hr) was from equipment found leaking using Method 21. Every leak found using Method 21 was also observed to be leaking either visually or using olfactory methods. All the rest of the detected leaks were observed to be leaking using sensory methods, but did not meet the leak definition (10,000 ppm) using Method 21. This demonstrates that no additional emission reductions are derived from the Method 21 inspections of pumps and valves.

Additionally, Attachment 2 shows that leaks from valves found using sensory methods totaled 0.111 kg/hr (the difference between 0.653 kg/hr and 0.542 kg/hr in the spreadsheet totals). This data demonstrates that a work practice program of sensory inspections and repair of all equipment in acetic acid service will likely yield greater emission reductions than the applicable NSPS work practice program.

While Eastman believes that this conclusion may hold true for other chemicals, this application is restricted to equipment in acetic acid service (>10 percent by weight with other VOCs less than 10 percent by weight). The sensory methods work particularly well with acetic acid because of its physical properties. Due to acetic acid's low odor threshold, leaks are readily noticed by personnel in the operating area. Often, the leak can be pinpointed by tracing the odor to the source. The boiling point of acetic acid is 118 degrees Centigrade and, since the majority of the process equipment is handling process fluids below this temperature, most of the leaks will manifest themselves as a liquid drip. Also, because of its high corrosivity, acetic acid leaks often stain or rust the metal components of the leaking fitting. Finally, in the case of cellulose acetate manufacturing, the process fluid may contain cellulose acetate. When the process fluid leaks, the cellulose acetate component leaves a precipitate residue indicative of a leak.

The data we have supplied is from our Cellulose Acetate production area. However, we have other processing areas with equipment in the same service (primarily acetic acid) to which we request this equivalence of means determination apply. Due to the physical properties of acetic acid, we believe the conclusion demonstrated that a sensory based program is equivalent (or better) than the program required by NSPS Subpart VV applies to any Subpart VV affected facility in acetic acid service.

Written Commitment to Work Practice (40 CFR Section 60.484(c)(4))

Upon approval of this application by the Administrator as an alternative but equivalent means of compliance with 40 CFR Section 60.482-2, 40 CFR Section 60.482-4, 40 CFR Section 60.482-7, and 40 Section CFR 60.482-8 for equipment in acetic acid service (defined as equipment that contains or contacts a process fluid that is greater than 10 percent by weight acetic acid and less than 10 percent other VOCs) at its Tennessee Operations, Eastman commits to comply with the alternative equipment leak detection and repair program prescribed in Attachment 1 or as conditioned by the Administrator in the approval notice.

Attachment 1

Quarterly Leak Inspection and Repair

(a) A leak inspection of all equipment in air contaminant service (contains or contacts a process fluid that is at least 10% air contaminant by weight) that is not "in heavy liquid service" or "in vacuum service" shall be performed once per calendar quarter. For this inspection, detection methods incorporating sight (e.g. looking for drips), sound (e.g. hissing sounds indicative of a leak), or smell (e.g. strong odors traceable to piping leaks) shall be used as appropriate. "Equipment" includes piping, pumps, compressors, pressure relief devices, sampling connection systems, open-ended valves or lines, valves, and flanges. "In heavy liquid service" means when less than 20 weight percent of the process fluid consists of air contaminants having pure component vapor pressures greater than 0.044 psia at 68 degrees F, and the process fluid is not in the gaseous state at operating conditions. "In vacuum service" means equipment that is operating at an internal pressure which is at least 0.7 psia below ambient pressure. Equipment that is covered by insulation or obstructed from sight when standing on existing floors or walkways is exempt from this inspection. Equipment that is in air contaminant service less than 300 hours in a calendar quarter is exempt from this inspection for that quarter.

(b) When a leak is detected, an initial attempt at repair shall be made no later than 5 calendar days after the leak is detected. Repair or replacement of leaking equipment shall be completed within 15 calendar days after detection of each leak, except as provided in paragraph (c) below.

(c) (1) Delay of repair of leaking equipment will be allowed if the repair is technically infeasible without a process unit shutdown or if repair personnel would be exposed to an immediate danger if attempting a repair without a process shutdown. Repair of this equipment shall occur by the end of the next process unit shutdown.

(2) Delay of repair of equipment for which leaks have been detected is allowed for equipment that is isolated from the process and that does not remain in air contaminant service.

(3) Delay of repair for valves, connectors, and agitators is also allowed if the owner or operator determines that emissions of purged material resulting from immediate repair would be greater than the fugitive emissions likely to result from delay of repair.

(4) Delay of repair beyond a process unit shutdown will be allowed for a valve if valve assembly replacement is necessary during the process unit shutdown, valve assembly supplies have been depleted, and valve assembly supplies had been sufficiently stocked before the supplies were depleted. Delay of repair beyond the second process unit shutdown will not be allowed unless the third process unit shutdown occurs sooner than 6 months after the first process unit shutdown.

(5) Delay of repair of pumps for up to 6 months after leak detection is allowed if the pump is replaced with (i) a dual mechanical seal system, (ii) a pump with no externally actuated shaft penetrating the pump housing, or (iii) a new system that the permittee has determined will provide better performance.

(d) Recordkeeping Requirements

(1) Records must be maintained that identify piping systems or process areas subject to this plan.

(2) Records of all inspections must be kept documenting the inspection was conducted and the date of the inspection. If no leaks are detected during the inspection, the record must indicate this result.

(3) When a leak is detected during the quarterly inspection, the following information shall be recorded:

(i) Component identifier or description of location and operator name, initials, or identification number.
(ii) The date the leak was detected.
(iii) The date the initial attempt at repair is made.
(iv) The date of successful repair of the leak. "Successful repair" means the leak is no longer detected using the inspection procedure outlined in item 10(a).
(v) "Repair delayed" and the reason for the delay if a leak is not repaired within 15 days after discovery of the leak.

ATTACHMENT 6
TITLE V FEE SELECTION FORM APC 36 (CN-1583)

DEPARTMENT OF ENVIRONMENT AND CONSERVATION
DIVISION OF AIR POLLUTION CONTROL
William R. Snodgrass Tennessee Tower
312 Rosa L. Parks Avenue, 15th Floor, Nashville, TN 37243
Telephone: (615) 532-0554, Email: Air.Pollution.Control@TN.gov

TITLE V FEE SELECTION

Type or print and submit to the email address above.

FACILITY INFORMATION

1. Organization's legal name and SOS control number [as registered with the TN Secretary of State (SOS)]

2. Site name (if different from legal name)

3. Site address (St./Rd./Hwy.)	County name
City	Zip code

4. Emission source reference number	**5.** Title V permit number

FEE SELECTION

This fee selection is effective beginning January 1, _____. When approved, this selection will be effective until a new Fee Selection form is submitted. Fee Selection forms must be submitted on or before December 31 of the annual accounting period.

6. Payment Schedule (choose one):

Calendar Year Basis (January 1 – December 31) ☐ Fiscal Year Basis (July 1 – June 30) ☐

7. Payment Basis (choose one):

Actual Emissions Basis ☐ Allowable Emissions Basis ☐ Combination of Actual and Allowable Emissions Basis ☐

8. If Payment Basis is "Actual Emissions" or "Combination of Actual and Allowable Emissions", complete the following table for each permitted source and each pollutant for which fees are due for that source. See instructions for further details.

Source ID	Pollutant	Allowable or Actual Emissions	If allowable emissions: Specify condition number and limit. If actual emissions: Describe calculation method and provide example. Provide condition number that specifies method, if applicable.

8. (Continued)

Source ID	Pollutant	Allowable or Actual Emissions	If allowable emissions: Specify condition number and limit. If actual emissions: Describe calculation method and provide example. Provide condition number that specifies method, if applicable.

CONTACT INFORMATION (BILLING)

9. Billing contact			Phone number with area code
Mailing address (St./Rd./Hwy.)			Fax number with area code
City	State	Zip code	**Email address**

SIGNATURE BY RESPONSIBLE OFFICIAL

Based upon information and belief formed after reasonable inquiry, I, as the responsible person of the above mentioned facility, certify that the information contained in the submittal is accurate and true to the best of my knowledge. As specified in TCA Section 39-16-702(a)(4), this declaration is made under penalty of perjury.

10. Signature		Date
Signer's name (type or print)	**Title**	Phone number with area code

PSD Construction Permit 955272F
(Eastman Chemical Company)

TENNESSEE AIR POLLUTION CONTROL BOARD
DEPARTMENT OF ENVIRONMENT AND CONSERVATION
NASHVILLE, TENNESSEE 37243-1531

Co. File s

Permit to Construct or Modify an Air Contaminant Source Issued Pursuant to Tennessee Air Quality Act

Date Issued: April 8, 2002

Permit Number:
955272F

Date Amended: September 27, 2002 [AMENDMENT]

Date Expires: June 1, 2003

Issued To:
Eastman Chemical Company

Installation Address:
South Eastman Road
Kingsport

Installation Description:
B-325-1
Coal-Fired Boilers 30 and 31
Modification: Installation of Low NOx Burners

Emission Source Reference No.
82-1010-15
PSD-NSPS-BACT

The holder of this permit shall comply with the conditions contained in this permit as well as all applicable provisions of the Tennessee Air Pollution Control Regulations.

CONDITIONS:

1. The application that was utilized in the preparation of this permit is dated February 1, 2002 (with February 11, 2002 update) and signed by W. Darrell Corpening of the permitted facility. If this person terminates his/her employment or is reassigned different duties such that he/she is no longer the responsible person to represent and bind the facility in environmental permitting affairs, the owner or operator of this air contaminant source shall notify the Technical Secretary of the change. Said notification shall be in writing and submitted within thirty (30) days of the change. The notification shall include the name and title of the new person assigned by the source owner or operator to represent and bind the facility in environmental permitting affairs. All representations, agreement to terms and conditions and covenants made by the former responsible person that were used in the establishment of limiting permit conditions on this permit will continue to be binding on the facility until such time that a revision to this permit is obtained that would change said representations, agreements and covenants.

(continued on next page)

Tony K. Stegalone
TECHNICAL SECRETARY

No Authority is Granted by this Permit to Operate, Construct, or Maintain any Installation in Violation of any Law, Statute, Code, Ordinance, Rule, or Regulation of the State of Tennessee or any of its Political Subdivisions.

NON TRANSFERABLE

POST AT INSTALLATION ADDRESS

2. Heat input to boilers #30 and #31 shall not exceed 780 and 880 Million British Thermal Units per hour (MMBTU/HR), respectively, on a 30 calendar day rolling average basis.

3. Particulate matter emitted from boiler #30 (Vent A) shall not exceed 14.0 pounds per hour (lb/hr). Particulate matter emitted from boiler #31 (Vent A) shall not exceed 15.8 pounds per hour (lb/hr).

4. Sulfur dioxide (SO_2) emitted from boiler #31 shall not exceed 293 lb/hr. Sulfur dioxide emissions from boiler #30 shall not exceed 317 lb/hr. Compliance will be determined on a 30 calendar day rolling average basis. Each 30 day average shall be the average of all hourly averages determined by the continuous monitoring system during the 30 day period. 40 CFR 60 Appendix A, Method 19 shall be used to determine hourly average emissions of sulfur dioxide expressed as pounds per million Btu heat input. Hourly average emissions of sulfur dioxide expressed as pounds per hour shall be determined by multiplying each hourly average sulfur dioxide emission rate expressed as pounds per million Btu by the respective hourly average heat input. Periods of non-operation of the source are included in the hourly averages and the 30 day rolling averages.

5. The spray dryer that serves boiler #31 shall have a minimum removal efficiency of 90% while burning coal or oil as required by 40 CFR 60 Subpart Db.

6. Volatile Organic Compounds (VOCs) emitted from boiler #30 (Vent A) shall not exceed 9.87 lb/hr. Volatile Organic Compounds (VOCs) emitted from boiler #31 (Vent A) shall not exceed 8.8 lb/hr.

7. Nitrogen oxides (NO_x) emitted from boiler #30 shall not exceed 0.6 lb/MMBtu heat input.

8. Nitrogen oxides (NO_x) emitted from boiler #31 shall not exceed 0.4 lb/MMBtu heat input. To demonstrate compliance with this emission limit, the procedures outline in 40 CFR 60.46b and 40 CFR 60.48b shall be utilized.

9. Carbon monoxide (CO) emitted from boiler #30 (Vent A) shall not exceed 170 lb/hr. Carbon monoxide (CO) emitted from boiler #31(Vent A) shall not exceed 176.0 lb/hr.

10. Fluorides (F) emitted from boilers #30 and #31 combined (Vent A) shall not exceed 5.0 lb/hr.

11. Hydrogen Chloride (HCl) emitted from boilers #30 and #31 combined (Vent A) shall not exceed 53.2 lb/hr.

12. Particulate matter emitted from boiler #30 coal bunker ventilation system (Vent C) shall not exceed 1.06 lb/hr.

13. Particulate matter emitted from boiler #31 coal bunker ventilation system (Vent E) shall not exceed 0.26 lb/hr.

14. Particulate matter emitted from the lime silo (Vent F) shall not exceed 0.09 lb/hr.

15. Particulate matter emitted from lime slakers and slurry storage tank (Vent G) shall not exceed 0.22 lb/hr.

16. Particulate matter emitted form Recycle ash silo (Vent H) shall not exceed 0.09 lb/hr.

17. Particulate matter emitted from lime silo (Vent I) shall not exceed 0.09 lb/hr.

(continued on next page)

18. Particulate matter emitted from boiler #30 and #31 flyash silo(Vent B) shall not exceed 0.3 lb/hr.

19. Particulate matter emitted from boilers #30 and #31 bottom ash silo(Vent D) shall not exceed 0.11 lb/hr.

20. Beryllium (Be) emitted from boiler #31 shall not exceed 0.004 lb/hr.

21. The source owner or operator shall maintain an Annual Leak Detection and Repair Program as described in Attachment A. (Fugitive VOCs and CO emitted from pumps, valves, etc. (Vent J) associated with boilers #30 and #31 are estimated at1.17 tons per year (ton/yr) and 0.4 tons per year, respectively.)

22. Fugitive particulate matter emitted from ash truck loading and lime truck unloading (Vent K) shall not exceed 0.4 ton/yr.

23. Operating time shall not exceed 8,568 hours per year for boiler #30.

24. A log of the operating hours for boiler #30 must be maintained at the source location and kept available for inspection by the Technical Secretary or his representative. This log must be retained for a period of not less than two years.

25. Visible emissions from boilers #30 and #31 (Vent A) shall not exceed 20 percent or greater opacity (6 minute average), except for one 6 minute period per hour of not more than 27 percent opacity as determined by 40 CFR Part 60 Appendix A Method 9.

26. The source owner or operator shall install, maintain, operate, and submit reports of excess emissions and sulfur dioxide (SO_2) removal efficiency [boiler #31] from continuous in-stack monitoring systems for sulfur dioxide (SO_2), [boiler #30 and #31] and nitrogen oxides (NO_x) [boiler #31] and either oxygen (O_2) or carbon dioxide as the diluent gas. The sensors of these monitoring systems shall be located in representative areas of the effluent gas stream of the boiler. Electronic signal combining systems shall be installed to convert the output of the pollutant monitors into units of the applicable emission standards. The in-stack sulfur dioxide monitoring systems shall meet all the requirements of 40 CFR Part 60 Appendix B Performance Specification 2 or 40 CFR Part 75 Appendix A. The in-stack nitrogen oxides and diluent gas monitoring systems for boiler #31 shall meet all the applicable requirements of 40 CFR Part 60 Appendix B or 40 CFR Part 75 Appendix A. The in-stack diluent gas monitoring system for boiler #30 shall meet all the applicable requirements of 40 CFR Part 60 Appendix B or 40 CFR Part 75 Appendix A.

27. Operational condition for Sulfur Dioxide (SO_2) and Nitrogen Oxides (NO_x) Monitoring Systems

    The use of continuous in-stack monitoring for sulfur dioxide [boilers #30 and #31] and nitrogen oxides [boiler #31] and the monitoring of the sulfur dioxide input to the control device [boiler #31] is the method by which these boilers prove continual compliance with the applicable sulfur dioxide and nitrogen oxides emissions limitations and sulfur dioxide emission reduction requirement. Therefore, for each boiler to demonstrate continual compliance with the applicable sulfur dioxide and nitrogen oxides emissions limitations, the in-stack nitrogen oxides and/or sulfur dioxide monitoring systems shall each be fully operational for at least eighty-five (85) percent of the operational time of the monitored boiler during each month of the calendar quarter. An operational availability of less than this amount may be considered the basis for declaring the source to be non-compliance with the applicable monitoring requirements, unless the reasons for the failure to maintain this level of operational availability are accepted by this division as being legitimate malfunctions of the instruments.

(continued on next page)

28. Quality Assurance Condition for the Sulfur Dioxide (SO_2) and Nitrogen Oxides (NO_x) Monitoring Systems. The continuous in-stack sulfur dioxide monitoring systems shall meet all of the requirements of 40 CFR Part 60 Appendix F or 40 CFR Part 75 Appendix B. The continuous in-stack nitrogen oxides and diluent gas monitoring systems for boiler #31 shall meet all the applicable requirements of 40 CFR Part 60 Appendix F or 40 CFR Part 75 Appendix B. The in-stack diluent gas monitoring system for boiler #30 shall meet all the applicable requirements of 40 CFR Part 60 Appendix F or 40 CFR Part 75 Appendix B.

29. The owner or operator shall submit excess emission reports and CEMS downtime reports to this Division for each calendar quarter in accordance with Rule 1200-3-10-.02(2). If there are no excess emissions or CEMS downtime during this quarter, the owner or operator shall submit a report to that effect.

30. For the pollutants with emission limitations placed on this permit, the emission measuring test methods and procedures are as follows:

Pollutant	Testing Methodology
Particulates	EPA Method 5 as published in 42 FR 41776 and subsequent amendments.
Fluorides (F)	EPA Method 13 as published in 45 FR 41852 and subsequent amendments.
Sulfur dioxide (SO_2)	See permit condition #4
Nitrogen Oxides (NO_x)	See permit condition #8
Hydrogen Chloride (HCl)	EPA Method 26 as published in 56 FR 5770
Beryllium (Be)	EPA Method 104 as published in 40 CFR 61, Appendix B
Carbon monoxide (CO)	EPA Method 10 as published in 39 FR 9319
Volatile Organic Compounds (VOCs)	EPA Method 25 as published in 45 FR 65959

31. The source owner or operator shall install, calibrate, operate, and submit reports of excess emissions from an in-stack continuous opacity monitoring system located on the common stack serving both boilers #30 and #31. Therefore, for this fuel burning installation to demonstrate continual compliance with the applicable opacity limitation, the in-stack opacity monitor shall be fully operational for at least ninety-five (95) percent of the operational time of the monitored units during any calendar quarter. An operational availability of less than this amount may be considered the basis for declaring the fuel burning installation to be in noncompliance with the applicable monitoring requirements, unless the reasons for the failure to maintain this level of operational availability are accepted by the Division as being legitimate malfunctions of the instrument. In the event of a disparity between the instrument's reading versus that of a qualified visible emission evaluator, the Technical Secretary may require the source to conduct any necessary testing or investigations needed to resolve the disparity.

    On-stack quality assurance audits shall be performed on the opacity monitor on a semiannual basis. These on-stack quality assurance audits shall be conducted in a manner prescribed by the Technical Secretary, and written reports of these audits shall be submitted to the Technical Secretary.

    Furthermore, within ninety (90) days of each major modification, or major repair of the opacity monitor, a repeat of the performance test shall be conducted and a written report of it submitted to the Technical Secretary as proof of the continuous operation of the opacity monitor within acceptable accuracy limits.

32. No hazardous waste shall be burned in boiler #31.

(continued on the next page)

33. The permittee shall revise their submitted Title V operating permit application within thirty (30) days of the publication date of the initial Title V public notice for this facility.

34. The permittee shall certify the start-up date of the modified air contaminant source regulated by this permit by submitting

A COPY OF ALL PAGES OF THIS PERMIT,

with the information required in A) and B) of this condition completed, to the Technical Secretary's representatives listed below:

A) DATE OF START-UP: _____ / ____ / _____
month day year

B) Anticipated operating rate: ____ percent of maximum rated capacity

For the purpose of complying with this condition, "start-up" of the modified air contaminant source shall be the date of the setting in operation of the modified source for the production of product for sale or use as raw materials or steam or heat production.

The undersigned represents that he/she has the full authority to represent and bind the permittee in environmental permitting affairs. The undersigned further represents that the above provided information is true to the best of his/her knowledge and belief.

Signature		Date
Signer's name (type or print)	Title	Phone (with area code)

Note: This certification is not an application for an operating permit. At a minimum, the appropriate application form(s) must be submitted requesting an operating permit. The application must be submitted in accordance with the requirements of this permit.

The completed certification shall be delivered to the Compliance Validation Program and the Environmental Assistance Center at the addresses listed below, no later than thirty (30) days after the modified air contaminant source is started-up.

Compliance Validation Program
Division of Air Pollution Control
9th Floor, L & C Annex
401 Church Street
Nashville, TN 37243-1531

Johnson City Environmental Assistance Center
Division of Air Pollution Control
2305 Silverdale Road
Johnson City, TN 37601-2162

(end of conditions)

This permit was amended by making the following changes, in accordance with permittee request dated August 27, 2002:

1. In condition 5, deleted the second sentence.
2. In condition 26, added at the end of the fourth sentence "or 40 CFR Part 75 Appendix A"
3. In condition 28, added at the end of the second sentence "or 40 CFR Part 75 Appendix B"
4. In condition 27, deleted "measured as per 40 CFR 60 47b".
5. Division of Air Pollution Control made corrections of typographical errors in the permit.

Process Emission Sources	2	0.34
		4.19

Attachment K1

Natural Gas-Fired Fuel Burning and Process Emission Sources

For pipeline natural gas combustion sources, Tennessee calculated SO_2 emissions using an emission factor of 0.6 lb SO_2/MMSCF of natural gas combusted[1]. EPA's emission factor states, "*Emissions of SO_2 from natural gas-fired boilers are low because pipeline quality natural gas typically has sulfur levels of 2,000 grains per million cubic feet. However, sulfur-containing odorants are added to natural gas for detecting leaks, leading to small amounts of SO_2 emissions. Boilers combusting unprocessed natural gas may have higher SO_2 emissions due to higher levels of sulfur in the natural gas. For these units, a sulfur mass balance should be used to determine SO_2 emissions.*"

[1] U. S. EPA, *AP-42, Fifth Edition, Volume I Chapter 1: External Combustion Sources*, Table 1.4-2 (Emission Factors for Criteria Pollutants and Greenhouse Gases from Natural Gas Combustion).

Eastman Chemical Company's Title V applications are submitted by Major Source Operating Permit (MSOP) and are subdivided by Permitted Emission Source (PES). The numbering of each section restarts with the first page. For example, the information for gas-fired boilers 32, 33, and 34 may be found in the application for MSOP-02 dated June 2, 2021, section PES B-83-11, pages 2 through 7. Each PES is further subdivided into application forms and supporting calculations. Pages numbered with Arabic numerals indicate application forms, while pages numbered as "C-1, C-2, etc." refer to the calculations section of the PES.

Pursuant to Tennessee Code Annotated 68-201-105(b)(2)[1], Eastman Chemical Company has requested protection of certain items as confidential business information (CBI). The following information will be submitted directly to EPA in accordance with the Agency's policies for handling of CBI.

Emission Source Reference Number	Description
82-0003-247 (MSOP-24)	PES B-238-1, description of maximum heat input and fuel usage
82-0003-305 (MSOP-24)	PES H2 Plants, description of maximum heat input and fuel usage

[1] The department has the power and duty to... Require that any person furnish the department information required by it in discharge of its duties under this part, if the department has reason to believe such person is, or may be about to, causing or contributing to air pollution; provided, that no such person shall be required to disclose any secret formulae, processes or methods used in any manufacturing operation carried on by such person or under such person's direction. The composition of air contaminants shall not be considered secret unless so declared by the department, and the department shall have the power to issue protection orders to prevent public dissemination;

4. Year of construction or last modification:
1995

If the emissions are controlled for compliance, attach an appropriate Air Pollution Control system form.

5. Normal operating schedule: 24 Hrs./Day 7 Days/Wk. 365 Days/Yr.

6. Location of this process emission source in UTM coordinates: UTM Vertical: 4042400N UTM Horizontal: 361600E

7. Describe this process (Please attach a flow diagram of this process) and check one of the following:
☐ Batch ✓ Continuous

PROCESS MATERIAL INPUT AND OUTPUT

8. List the types and amounts of raw materials input to this process:

Material	Storage/Material handling process	Average usage (units)	Maximum usage (units)
1. Crude Catalyst	closed pipe	CBI	CBI
2. Iodine	closed pipe	CBI	CBI
3. Methyl Acetate	closed pipe	CBI	CBI
4. Acetic Acid	closed pipe	CBI	CBI
5. Resin	closed pipe	CBI	CBI
6. Catalyst	closed pipe	CBI	CBI
7. Lithium	closed pipe	CBI	CBI
8. Ketone	closed pipe	CBI	CBI
9. Natural Gas	closed pipe	CBI	CBI
10. Air	closed pipe	CBI	CBI
11. Crude Methyl Iodide	closed pipe	CBI	CBI
12. Hydrogen	closed pipe	CBI	CBI
13. Water	closed pipe	CBI	CBI

9. List the types and amounts of primary products produced by this process:

Material	Storage/Material handling process	Average ~~usage~~ Amount Produced (units)	Maximum ~~usage~~ Amount Produced (units)
Catalyst	closed pipe	CBI	CBI

10. Process fuel usage:

Type of fuel	Max heat input (10^6 BTU/Hr.)	Average usage (units)	Maximum usage (units)
Natural Gas	2.75	2750 SCUFT/HR	2750 SCUFT/HR
Tar	2.36	315 LB/HR	315 LB/HR

11. List any solvents, cleaners, etc., associated with this process:
Ester, acid and alcohol for cleaning process equipment and lines

If the emissions and/or operations of this process are monitored for compliance, please attach the appropriate Compliance Demonstration form.

12. Describe any fugitive emissions associated with this process, such as outdoor storage piles, open conveyors, open air sand blasting, material handling operations, etc. (please attach a separate sheet if necessary).
Equipment leaks such as pumps, valves, and flanges.

1.5 Percent

N/A Grains per dry standard cubic foot (gr./dscf.)

11. Exhaust temperature that is equaled or exceeded during ninety (90) percent or more of the operating time (for stacks subject to diffusion equation only):

N/A (°F)

12. If this stack is equipped with continuous pollutant monitoring equipment required for compliance, what pollutant(s) does this equipment monitor (e.g., Opacity, SO_2, NO_x, etc.)?

N/A

Complete the appropriate APC form(s) 4, 5, 7, 8, 9, or 10 for each source exhausting through this stack.

BYPASS STACK DESCRIPTION

13. Do you have a bypass stack?

☐ Yes X No

If yes, describe the conditions which require its use & complete APC form 4 for the bypass stack. Please identify the stack number(s) of flow diagram point number(s) exhausting through this bypass stack.

Calculations

Calculation Documentation Form A2: General Information for Uncontrolled Emissions

PES # B-338-3 Vent ID A

Process Catalyst Recovery Division Chemicals Manufacturing Department AA

Scheduling Basis for Emissions:

8760 hrs/yr X Operating hrs/yr _____ or Number of batches/year _____

Type of Emission: X Uncontrolled Process Vent with No Recovery Device

_____ Other Emission Not Otherwise Captured (such as emissions not captured from open vessels, filters, conveyors, and material handling operations)

Special Physical Property Notes:

None

Assumptions Used:

None

Describe the Calculation Method Used:

Engineering judgment and expected operating conditions used in conjunction with AP-42 emissions factors (for combustion of natural gas and fuel oil). Stack tests from previous operating scenarios also taken into consideration in developing revised emissions estimates.

CO2e estimated using emissions estimates and CO2e factors.

Results:

Component	Average Lb/Hr	Maximum Lb/Hr	Tons/Yr**
VOC		0.06	0.13
Carbon Monoxide		0.29	1.08
Sulfur Dioxide		0.10	0.44
Nitrogen Oxides		1.8	4.40
CO2e			3608
TSP (assumed to be all PM2.5 and PM10)		0.31	0.9
Iodine		<= 0.36	1.60
Particulate HAP *		Negligible	Negligible

* AP-42 5th Edition section 1.4, table 1.4-4, emission factors for metals from natural gas combustion
** Source is unable to operate at maximum rates on a continual basis. Tons/yr determined based on maximum annual average operating conditions.

STACK IDENTIFICATION

GENERAL IDENTIFICATION AND DESCRIPTION

1. Facility name:
Eastman Chemical Company, Tennessee Operations

2. Emission source (identify):
PES B-545-1

STACK DESCRIPTION

3. Stack ID (or flow diagram point identification):
B

4. Stack height above grade in feet:
150

5. Velocity (data at exit conditions):
56.5 (Actual feet per second)

6. Inside dimensions at outlet in feet:
2

7. Exhaust flow rate at exit conditions (ACFM):
10,644

8. Flow rate at standard conditions (DSCFM):
8,728

9. Exhaust temperature:

768 (Degrees Fahrenheit (°F)

10. Moisture content (data at exit conditions):

18 Percent _____ Grains per dry standard cubic foot (gr./dscf)

11. Exhaust temperature that is equaled or exceeded during ninety (90) percent or more of the operating time (for stacks subject to diffusion equation only):

N/A (°F)

12. If this stack is equipped with continuous pollutant monitoring equipment required for compliance, what pollutant(s) does this equipment monitor (e.g., Opacity, SO_2, NO_2, etc.)?

N/A

Complete the appropriate APC form(s) 4, 5, 7, 8, 9, or 10 for each source exhausting through this stack.

BYPASS STACK DESCRIPTION

13 .Do you have a bypass stack? ☐ Yes ☒ No

If yes, describe the conditions which require its use & complete APC form 4 for the bypass stack. Please identify the stack number(s) of flow diagram point number(s) exhausting through this bypass stack.

Application Attachment

Calculations

Calculation Documentation Form: Control or Recovery Device

PES # B-545-1 Vent ID C

Additional control or recovery device data (include vendor guarantees):

Special Physical Property Notes:

Assumptions Used:

Vapor incinerator is rated at 18 MMBtu/hr but calculations are being performed at 22 MMBtu/hr.

Process Inlet:

The process inlet to the vapor incinerator associated with Vent C has been calculated based upon the maximum vapor flow and composition determined in the process heat and material balance. The maximum lb/hr emissions along with the CBI production limit were used to determine the annual emissions.

The vapor incinerator is assumed to provide 99% destruction of VOC and Other Organics and 98% destruction of CO.

The process gas is assumed to produce the same emissions as natural gas for PM2.5, PM10, PM, and NOx. The process inlet should not contain any amounts of SO2, Lead, Mercury, or Beryllium. CO2 emissions are calculated assuming that all of the organics in the process inlet are combusted.

Natural Gas:

Heating value of natural gas = 1020 BTU/scf

AP-42 factors were used as basis for all pollutants except for NOx and CO. NOx emissions are based on a factor of 0.05 lb/MMBtu. CO emissions are based on an exit gas concentration of 50 ppmv.

Describe the method used to estimate control or recovery device efficiency:

Equipment Specification / Performance Test.

11. List any solvents, cleaners, etc., associated with this process:
N/A

If the emissions and/or operations of this process are monitored for compliance, please attach the appropriate Compliance Demonstration form.

12. Describe any fugitive emissions associated with this process, such as outdoor storage piles, open conveyors, open air sand blasting, material handling operations, etc. (please attach a separate sheet if necessary).
Fugitive emissions associated with this process contain fugitive emissions from pumps, valves, flanges, etc.

STACK IDENTIFICATION

GENERAL IDENTIFICATION AND DESCRIPTION

1. Facility name:
Eastman Chemical Company, Tennessee Operations

2. Emission source (identify):
PES B-238-1

STACK DESCRIPTION

3. Stack ID (or flow diagram point identification):
F

4. Stack height above grade in feet:
73

5. Velocity (data at exit conditions):
12.5 (Actual feet per second)

6. Inside dimensions at outlet in feet:
3.5

7. Exhaust flow rate at exit conditions (ACFM):
7,192

8. Flow rate at standard conditions (DSCFM):
3,600

9. Exhaust temperature:

400 (Degrees Fahrenheit (°F)

10. Moisture content (data at exit conditions):

19 Percent

Grains per dry standard cubic foot (gr./dscf)

11. Exhaust temperature that is equaled or exceeded during ninety (90) percent or more of the operating time (for stacks subject to diffusion equation only):

___ (°F)

12. If this stack is equipped with continuous pollutant monitoring equipment required for compliance, what pollutant(s) does this equipment monitor (e.g., Opacity, SO_2, NO_2, etc.)?

Complete the appropriate APC form(s) 4, 5, 7, 8, 9, or 10 for each source exhausting through this stack.

BYPASS STACK DESCRIPTION

13 .Do you have a bypass stack? ☐ Yes ☒ No

If yes, describe the conditions which require its use & complete APC form 4 for the bypass stack. Please identify the stack number(s) of flow diagram point number(s) exhausting through this bypass stack.

MISCELLANEOUS PROCESSES

1. Facility name:
Eastman Chemical Company, Tennessee Operations

2. Process emission source (identify):
PES B-190-1

3. Stack ID or flow diagram point identification(s):
See APC 10 Attachment

4. Year of construction or last modification:
1996

If the emissions are controlled for compliance, attach an appropriate Air Pollution Control system form.

5. Normal operating schedule: 24 Hrs./Day 7 Days/Wk. 365 Days/Yr.

6. Location of this process emission source in UTM coordinates: UTM Vertical: 4043100 N UTM Horizontal: 362000 E

7. Describe this process (Please attach a flow diagram of this process) and check one of the following:
☐ Batch ☒ Continuous

PROCESS MATERIAL INPUT AND OUTPUT

8. List the types and amounts of raw materials input to this process:

Material	Storage/Material handling process	Average usage (units)	Maximum usage (units)
Plastic pellets and miscellaneous dye / additive blends	Bins, silos, bulk-sacks, & tote-boxes / closed pipe airvey systems & forklifts	CBI	CBI
Compounding polymer plastics	N/A	CBI	CBI

9. List the types and amounts of primary products produced by this process:

Material	Storage/Material handling process	Average ~~usage~~ Amount Produced (units)	Maximum ~~usage~~ Amount Produced (units)
Compound plastics & miscellaneous blends	Bins, silos, & tote-boxes / closed pipe airvey systems & forklifts	CBI	CBI

10. Process fuel usage:

Type of fuel	Max heat input (10^6 BTU/Hr.)	Average usage (units)	Maximum usage (units)
Natural Gas	0.35 MMBTU/hr	N/A	700 cf/hr

11. List any solvents, cleaners, etc., associated with this process:
N/A

If the emissions and/or operations of this process are monitored for compliance, please attach the appropriate Compliance Demonstration form.

12. Describe any fugitive emissions associated with this process, such as outdoor storage piles, open conveyors, open air sand blasting, material handling operations, etc. (please attach a separate sheet if necessary).
N/A

Calculations

Calculation Documentation Form C: Control Device and General Information

PES # B-190-1 Vent ID F

Process Pyrolysis Division Cellulose Esters and Specialty Plastics Department Manuf. B-190

Scheduling Basis for Emissions: 8760 hrs/yr

Control Device Information:

Description:	Direct flame afterburner thermal oxidation unit
Manufacturer:	Pollution Control Products Co.
Model:	SCTR 15
Minimum Operating Temperature:	1300° F
Maximum Operating Temperature:	1500° F
Normal Operating Temperature:	1400° F – 1500° F

The secondary chamber is an integral part of the furnace, built into the unit and wired so the unit cannot operate without the secondary chamber being in operation.

Special Physical Property Notes:
Emissions estimates from pyrolysis parts cleaning oven based on vendor provided source testing data generated while processing similar materials.
Carbon dioxide equivalents were estimated using 40CFR subpart 98 Table A-1 factors.

Assumptions Used:
Conservatively, assume all TSP is PM10 and PM 2.5.
The natural gas used to fire the oven and afterburner contains no more sulfur containing compounds (odorizers for leak detection) than that used in operation at the time the referenced source testing was performed.
All emissions of sulfur oxides are sulfur dioxide.

Describe the method used to estimate control device efficiency:
Source testing to quantify emissions of particulate matter, nitrogen oxides, hydrocarbons, sulfur oxides, and carbon monoxide has been performed by an independent laboratory at the request of the pyrolysis cleaning furnace manufacturer. The testing was conducted on an identical unit while processing similar materials at the maximum design processing rate. The air contaminant emissions and afterburner control efficiency were based exclusively on the vendor provided source testing data and a full-time operating schedule.

Emissions:

Pollutant	Average (lb/hr)	Maximum (lb/hr)	TPY
Particulates	0.013	0.013	0.06
Sulfur Dioxide (SO2)	0.002	0.002	0.01
Nitrogen Oxides (NOx)	0.027	0.027	0.12
VOC	0.017	0.017	0.08
Carbon Monoxide (CO)	0.05	0.05	0.22
Carbon Dioxide Equivalents (CO_2e)	8.4	8.4	36.90
PM10*	0.013	0.013	0.06
PM2.5*	0.013	0.013	0.06

*PM10 and PM 2.5 emissions are included with particulate (TSP) emissions and should not be counted as additional emissions.

Calculation Documentation Form A: General Information

PES # B-190-1 Vent ID L

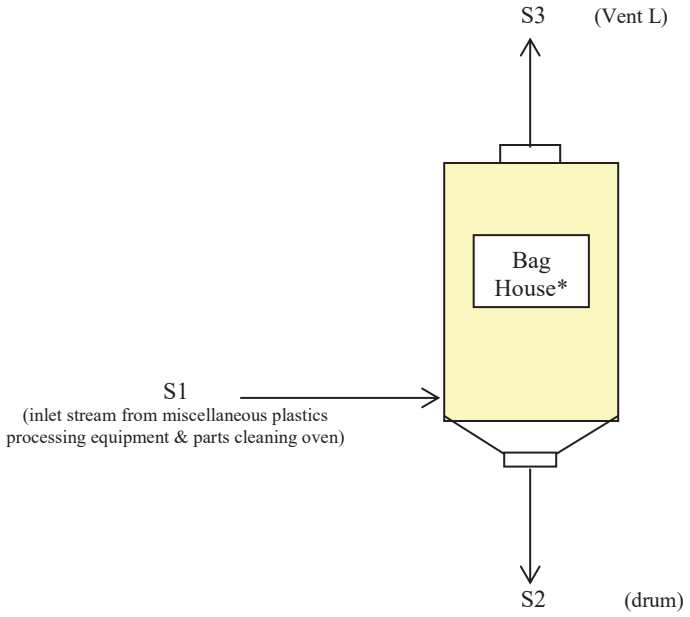
Process DC 24 Division Cellulose Esters and Specialty Plastics Department Manuf. B-190

Scheduling Basis for Emissions:

8760 hrs/yr X Operating hrs/yr _____ or Number of batches/year _____

Sketch the equipment for which emissions calculations were performed, showing its configuration. Include equipment data on the sketch and lb/hr flows below:

Conditions Shown are: Max ____ Avg. ____



Stream Flows, lb/hr:

Component	S1	S2	S3	S4	S5	tons/yr
Air	11610	0	11610			
Particulates	44	43.56	0.44			1.93
VOC	1.09	0	1.09			4.77
Carbon Monoxide	0.25	0	0.25			1.1
Nitrogen Oxides	Negligible	0	Negligible			Negligible
Sulfur Dioxide	0.002	0	0.002			0.01
PM10**	7.92	7.48	0.44			1.93
PM2.5**	7.92	7.48	0.44			1.93
CO2e	3.1	0	3.1			12.4
Total	11654.52	12.87	11610.96			
Pressure (units?)	14.1 psi	14.1 psi	14.1 psi			
Temp (units?)	85° F	85°F	85° F			

*The Bag House is considered inherent to the process since the baghouse is part of the dust control system that is in place for the safe operation of the plant.

**PM10 and PM 2.5 emissions are included with particulate emissions (TSP) and should not be counted as additional emissions.

Calculation Documentation Form C: Control or Recovery Device

PES # B-190-1 Vent ID L

Most control device data should be shown on Form A: General Information.
Additional control device data (include vendor guarantees):

Description:	Bag House
Manufacturer:	Ultra Industries
Model #:	BW-144-144
Filter Bag Size:	5.75" OD x 144" L
Filter Bag Material:	14 oz. Nomex or equivalent

Special Physical Property Notes:

Emissions estimates from parts cleaning oven based on factors generated from various source testing data.
Assumed 18% of TSP loading is <PM10 based on data analysis.
Conservatively assume all TSP emissions are PM10 and PM2.5.

Assumptions Used:

Assumed a 99% particulate removal efficiency based on the filtered particle size distribution and fabric filter vendor provided information.

Particulate emissions from this unit do not exceed 0.02 grains per dry std. cu. ft. of flow.

Exit flow does not exceed 2480 DSCFM.

Describe the method used to estimate control device efficiency:
(and the calculation method used)

Filter Bags:

Assumed a minimum 99% removal efficiency for all suspended particulates and a maximum exit stream particulate concentration of 0.02 grains/DSCF, based on fabric filter vendor provided information.

Cleaning Oven:

Source for testing for particulates, organic compounds, carbon monoxide, and nitrogen oxides has been performed at the discharge of an identical unit, while processing specific materials and batch sizes. The results of additional source testing for particulates and organic compounds, while processing other materials with a specific batch size, has been provided by the equipment manufacturer. From this data, emission factors were generated, as a function of batch size, for each material with the potential to be processed in the oven. These emission factors were used, in conjunction with the estimated maximum batch size for the unit, to arrive at a final estimate for the maximum hourly emissions at the stack.

CO2e emissions were calculated used 40 CFR 98 subpart A Table A-1 factors.

6. Year of installation: 2000

7. Type (check one):
Catalytic oxidizer ☒
Thermal oxidizer ☐

8. List of pollutant(s) to be controlled and the expected control efficiency for each pollutant.

Pollutant	Efficiency (%)	Source of data
CO	98	Vendor Guarantee
VOC	98	Vendor Guarantee

9. If applicable, discuss how spent catalyst is handled for reuse or disposal:
Returned to vendor for credit

10. Equipment specifications:

Catalytic oxidation	Thermal oxidation
10A. Minimum operating temperature (ºF): 608	10B. Minimum operating temperature (ºF):
11A. Type of fuel used: Natural Gas	11B. Type of fuel used:
12A. Type of catalyst used and volume of catalyst used ($Ft.^3$): Platinum based, 116	12B. Not applicable.
13A. Maximum fuel use: 28 MMSCF/yr	13B. Maximum fuel use:
14A. Residence time (sec.): 2.7 x 10^-8	14B. Residence time (sec.):

15. If this control equipment is in series with some other control equipment, state and specify the overall efficiency:
Caustic scrubber follows the catalytic oxidizer. No additional removal efficiency of CO is added by the caustic scrubber. The total removal efficiency for the combined control system is represented in Item 8.

3. Stack ID or flow diagram point identification(s): UB

OXIDIZER DESCRIPTION

4. Describe the oxidation system in use. List the key operating parameters of this device and their normal operating range.

Device Description:	Regenerative thermal oxidizer (CI-F-201A)
Key Operating Parameter(s):	Combustion chamber temperature
Normal Operating Range(s):	Greater than 1600 ºF

5. Manufacturer and model number (if available):
Manufacturer: Durr Ecopur
Model Number: RI.80

6. Year of installation: 2019

7. Type (check one):
Catalytic oxidizer ☐
Thermal oxidizer ☒

8. List of pollutant(s) to be controlled and the expected control efficiency for each pollutant.

Pollutant	Efficiency (%)	Source of data
CO	98	Vendor Guarantee
VOC	98	Vendor Guarantee

9. If applicable, discuss how spent catalyst is handled for reuse or disposal: N/A

10. Equipment specifications:

Catalytic oxidation	Thermal oxidation
10A. Minimum operating temperature (ºF): N/A	10B. Minimum operating temperature (ºF): 1600
11A. Type of fuel used: N/A	11B. Type of fuel used: Natural Gas
12A. Type of catalyst used and volume of catalyst used ($Ft.^3$): N/A	12B. Not applicable.
13A. Maximum fuel use: N/A	13B. Maximum fuel use: 13,300 scfh
14A. Residence time (sec.): N/A	14B. Residence time (sec.): 1.15

15. If this control equipment is in series with some other control equipment, state and specify the overall efficiency:
Caustic scrubber follows the regenerative thermal oxidizer. No additional removal efficiency of CO is added by the caustic scrubber. The total removal efficiency for VOC by the combined control system is represented in Item 8.

GENERAL IDENTIFICATION AND DESCRIPTION

1. Facility name:
Eastman Chemical Company, Tennessee Operations

2. Process emission source (identify):
B-655-1

3. Stack ID or flow diagram point identification(s):
See APC 10 Attachment

4. Year of construction or last modification:
2021

If the emissions are controlled for compliance, attach an appropriate Air Pollution Control system form.

5. Normal operating schedule: 24 Hrs./Day 7 Days/Wk. 365 Days/Yr.

6. Location of this process emission source in UTM coordinates: UTM Vertical: 4042122 N UTM Horizontal: 362398 E

7. Describe this process (Please attach a flow diagram of this process) and check one of the following:
☐ Batch ☒ Continuous

PROCESS MATERIAL INPUT AND OUTPUT

8. List the types and amounts of raw materials input to this process:

Material	Storage/Material handling process	Average usage (units)	Maximum usage (units)
Mixed Plastics	None/Covered dump trucks, to a closed conveyor, to a closed air convey system	CBI	CBI
Methanol	Tanks/Closed Pipe	CBI	CBI
Sodium Hydroxide	Tanks/Closed Pipe	CBI	CBI
Catalyst	Tanks/Closed Pipe	CBI	CBI

9. List the types and amounts of primary products produced by this process:

Material	Storage/Material handling process	Average ~~usage~~ Amount Produced (units)	Maximum ~~usage~~ Amount Produced (units)
Dimethyl terephthalate	Tanks/Closed Pipe	CBI	CBI
Ethylene Glycol	Tanks/Closed Pipe	CBI	CBI
Co-Product	Tanks/Trailers	CBI	CBI

10. Process fuel usage:

Type of fuel	Max heat input (10^6 BTU/Hr.)	Average usage (units)	Maximum usage (units)
Natural Gas	169	165,687 (SCFH)	165,687 (SCFH)

11. List any solvents, cleaners, etc., associated with this process:
Not applicable.

If the emissions and/or operations of this process are monitored for compliance, please attach the appropriate Compliance Demonstration form.

12. Describe any fugitive emissions associated with this process, such as outdoor storage piles, open conveyors, open air sand blasting, material handling operations, etc. (please attach a separate sheet if necessary).
Fugitive emissions associated with this process include the following:
- Equipment leaks, such as pumps, valves, flanges, etc.
- Storage pile of chunks of plastic waste (IEU)

STACK IDENTIFICATION

GENERAL IDENTIFICATION AND DESCRIPTION

1. Facility name:
Eastman Chemical Company, Tennessee Operations

2. Emission source (identify):
B-655-1

STACK DESCRIPTION

3. Stack ID (or flow diagram point identification):
A

4. Stack height above grade in feet:
165

5. Velocity (data at exit conditions):
18.2 (Actual feet per second)

6. Inside dimensions at outlet in feet:
8

7. Exhaust flow rate at exit conditions (ACFM):
54,953

8. Flow rate at standard conditions (DSCFM):
33,433

9. Exhaust temperature:

370 (Degrees Fahrenheit (°F)

10. Moisture content (data at exit conditions):

0.3 Percent N/A Grains per dry standard cubic foot (gr./dscf)

11. Exhaust temperature that is equaled or exceeded during ninety (90) percent or more of the operating time (for stacks subject to diffusion equation only):

N/A (°F)

12. If this stack is equipped with continuous pollutant monitoring equipment required for compliance, what pollutant(s) does this equipment monitor (e.g., Opacity, SO_2, NO_2, etc.)?

NOx, VOC

Complete the appropriate APC form(s) 4, 5, 7, 8, 9, or 10 for each source exhausting through this stack.

BYPASS STACK DESCRIPTION

13. Do you have a bypass stack? ☒ Yes ☐ No

If yes, describe the conditions which require its use & complete APC form 4 for the bypass stack. Please identify the stack number(s) of flow diagram point number(s) exhausting through this bypass stack.

If the furnace fails, the process gas vents will be diverted to the West Vent Stack. The high oxygen streams which normally enter the furnace through the combustion air fans will be diverted to Vent C (West Vent Stack).

Eastman Chemical Company's Title V applications are submitted by Major Source Operating Permit (MSOP) and are subdivided by Permitted Emission Source (PES). The numbering of each section restarts with the first page. For example, the information for gas-fired boilers 32, 33, and 34 may be found in the application for MSOP-02 dated June 2, 2021, section PES B-83-11, pages 2 through 7. Each PES is further subdivided into application forms and supporting calculations. Pages numbered with Arabic numerals indicate application forms, while pages numbered as "C-1, C-2, etc." refer to the calculations section of the PES.

Eastman Chemical Company's Title V applications are submitted by Major Source Operating Permit (MSOP) and are subdivided by Permitted Emission Source (PES). The numbering of each section restarts with the first page. For example, the information for gas-fired boilers 32, 33, and 34 may be found in the application for MSOP-02 dated June 2, 2021, section PES B-83-11, pages 2 through 7. Each PES is further subdivided into application forms and supporting calculations. Pages numbered with Arabic numerals indicate application forms, while pages numbered as "C-1, C-2, etc." refer to the calculations section of the PES.

Application Attachment

Calculations

Calculation Documentation Form: No Control or Recovery Device

PES # B-90-7 Vent ID E

Emissions Unit Description: Crystallizers and Process Water Tanks

Scheduling Basis for Emissions: 8760 hrs/yr

Conditions Shown: Maximum

Special Physical Property Notes:
VOC activity coefficients estimated from Wilson parameter fit of vapor-liquid equilibrium data.

Assumptions Used:
VOC

Assumed no daily temperature fluctuations for continuous process.

Daily level fluctuations assumed to be 80% of total vessel volume.

100% Hazardous Air Pollutants.

SO2

Assumed that addition of SO_2 well below the solubility limit of SO_2 in water will provide sufficient time and mixing for the SO_2 to react completely, leaving no excess SO_2 in solution.

Describe the method used to calculate emissions:
VOC

Emissions from process vessels were estimated using the AP-42 Method for liquid storage tanks.

Emissions of hazardous air pollutants estimated using the projected typical liquid composition in the vessels.

SO2

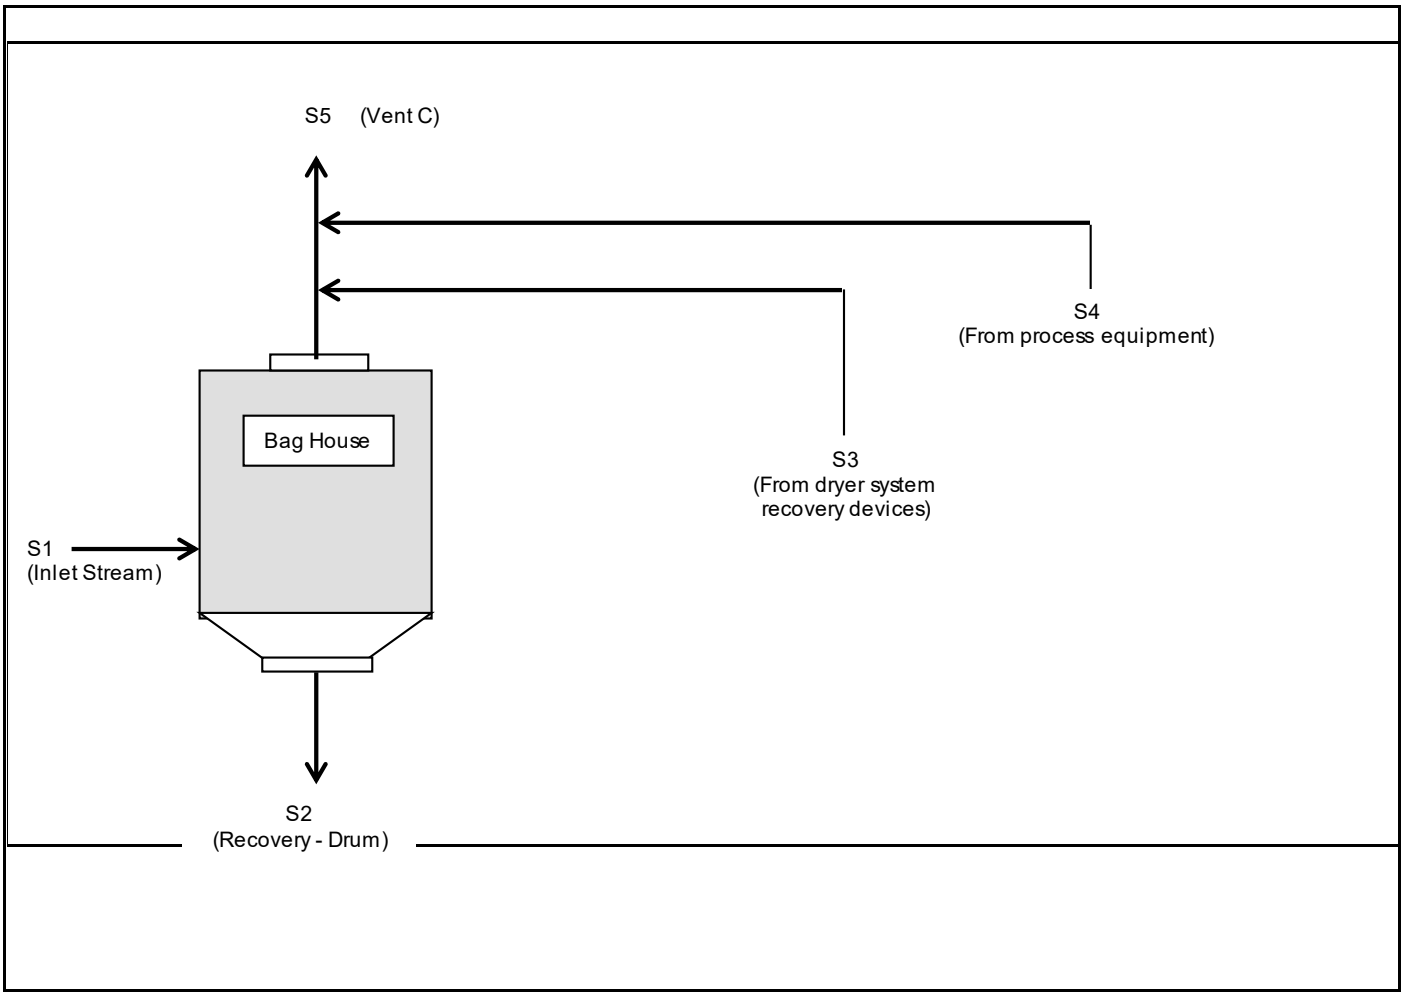
Emissions were estimated based on the addition of stoichiometric amount of SO_2 (no excess) to the process. The amount of SO_2 added to the process is calculated based on the current production rate.

Component	Emissions (lbs/hr)	Emissions (TPY)
VOC	Negligible	Negligible
SO2	0.01	0.04

Calculation Documentation Form: Control or Recovery Device

PES # B-90-7 Vent ID C

Emissions Unit Description: Product Convey, Drying, and MC-Y-05
Scheduling Basis for Emissions: 8760 hrs/yr
Conditions Shown: Maximum
Inherent Process Equipment? Yes



Component	S1 (lb/hr)	S2 (lb/hr)	S3 (lb/hr)	S4 (lb/hr)	S5 (lb/hr)	Emissions tons/yr
Particulates	5.55	5.1	Negligible	Negligible	0.45	1.97
VOC	0.02	---	Negligible	Negligible	0.02	0.09
SO_2	0.02	---	---	---	0.02	0.09

Calculation Documentation Form: Control or Recovery Device

PES # B-90-7 Vent ID C (Stream S1)

Additional control or recovery device data (include vendor guarantees):

DESCRIPTION:	BAG HOUSE
MANUFACTURER:	MAC FLOWTRONICS
MODEL NUMBER:	96RT28, STYLE III
FILTER BAGS:	28 BAGS, 16 OZ. POLYESTER FELT OR EQUIVALENT
TOTAL FILTER AREA:	369 FT2

Special Physical Property Notes:
Assumed all particulate matter being emitted is less than or equal to 10 microns in diameter.

Particle size distribution shows >92% of particulate matter fed to bag house consists of particles with a diameter ≥ 2 microns.

The volatile organic compound present has an insignificant vapor pressure under normal conditions.

Assumptions Used:
Assumed 99.9% particulate removal efficiency for particles with a diameter ≥ 2 microns, based on vendor provided information.

Particle size distribution and vendor efficiency information results in a 92% weighted average efficiency.

Assumed vent temperature of 77°F.

Assumed that addition of SO2 (or compounds that could liberate SO2) is well below the solubility limit of SO2 in water. In addition, process knowledge suggests there is more than adequate mixing and reaction time such that no excess SO2 remains in solution.

No removal of SO2 or VOC was assumed in the bag house.

Describe the method used to estimate control or recovery device efficiency:
Vendor Information

Describe the method used to calculate emissions:
Particulate emissions from bag house estimated based on the particulate physical property notes and the vendor guarantee.

Emissions were estimated based on the addition of a stoichiometric amount of SO2 (or SO2 liberating compounds) to the process. The amount of SO2 added to the process is calculated based on the current production rate.

VOC emissions were estimated based on engineering judgment and the physical property notes.

Calculation Documentation Form: No Control or Recovery Device

PES # B-90-7 Vent ID C (Stream S3)

Emissions Unit Description: Dryer System

Special Physical Property Notes:
N/A

Assumptions Used:
Assumed all particulate matter being emitted is less than or equal to 10 microns in diameter.

Describe the method used to calculate emissions:
Emissions estimated based on engineering judgment.

Calculation Documentation Form: No Control or Recovery Device

PES # B-90-7 Vent ID C (Stream S4)

Emissions Unit Description: MC-Y-05

Special Physical Property Notes:
Activity coefficients estimated from Wilson parameter fit of vapor-liquid equilibrium data.

Assumptions Used:
Assumed an average vent temperature of 77°F.

Assumed a liquid temperature leaving the vacuum source of 77°F.

Assumed a slurry temperature fed to the nutsche of 183°F.

Based on knowledge of process, assumed a negligible amount of particulate emissions.

Describe the method used to calculate emissions:
VOC emissions were estimated using Raoult's Law, in conjunction with the composition of the liquid ring in the vacuum source and the rated flow capacity of the unit.

TSP emissions were estimated using engineering judgment and the assumptions.

MSOP - 10
Tennessee Eastman Major Source Operating
Permit Application Identification

TITLE V PERMIT APPLICATION
STACK IDENTIFICATION

GENERAL IDENTIFICATION AND DESCRIPTION

1. Facility name:
Eastman Chemical Company, Tennessee Operations

2. Emission source (identify):
PES B-90B-1

STACK DESCRIPTION

3. Stack ID (or flow diagram point identification):

A1

4. Stack height above grade in feet:

75

5. Velocity (data at exit conditions):

20.0 (Actual feet per second)

6. Inside dimensions at outlet in feet:

2.167

7. Exhaust flow rate at exit conditions (ACFM):

4419

8. Flow rate at standard conditions (DSCFM):

3813

9. Exhaust temperature:

70 Degrees Fahrenheit (°F)

10. Moisture content (data at exit conditions):

3 Percent N/A Grains per dry standard cubic foot (gr./dscf.)

11. Exhaust temperature that is equaled or exceeded during ninety (90) percent or more of the operating time (for stacks subject to diffusion equation only):

N/A (°F)

12. If this stack is equipped with continuous pollutant monitoring equipment required for compliance, what pollutant(s) does this equipment monitor (e.g., Opacity, SO_2, NO_x, etc.)?

N/A

Complete the appropriate APC form(s) 4, 5, 7, 8, 9, or 10 for each source exhausting through this stack.

BYPASS STACK DESCRIPTION

13. Do you have a bypass stack?

☐ Yes X No

If yes, describe the conditions which require its use & complete APC form 4 for the bypass stack. Please identify the stack number(s) of flow diagram point number(s) exhausting through this bypass stack.

14. Page number: 4 of 24 | Revision number: R3-0 Renewal | Date of revision: **December 19, 2017**

Calculations

Calculation Documentation Form A2: General Information for Uncontrolled Emissions

PES # B-90B-1 Vent ID A1

Process Production Division CMD Department SOC

Scheduling Basis for Emissions: Maximum annual emissions based on the maximum usage of each specific piece of equipment within the boundaries of the emission source.

Type of Emission:

X Uncontrolled Process Vent with No Recovery Device

____ Other Emission Not Otherwise Captured (such as emissions not captured from open vessels, filters, conveyors, and material handling operations)

Special Physical Property Notes:

A specific molecular weight was consistently used throughout the VOC emission calculations for the system. This value was the average molecular weight of the two most volatile components in the system.

Assumptions Used:

Based on ambient air industrial hygiene VOC testing data, the discharge stream from any given unit does not exceed 10 ppmv.

Assumed a specific particulate concentration of the discharge stream from each unit, based on engineering judgment and knowledge of the process.

Assumed solubility of SO_2 in water at 55°C to be negligible based on engineering judgment and knowledge of process.

Describe the Calculation Method Used:

The aforementioned assumptions were used in conjunction with discharge stream flow rates to estimate the VOC and particulate emissions to the atmosphere.

There are no known emissions of Hazardous Air Pollutants.

The aforementioned assumptions were used in conjunction with batch production procedures to estimate the SO_2 emissions to the atmosphere.

Emissions:

Pollutant	Average lb/hr	Maximum lb/hr	TPY
VOC	0.59	1.1	2.60
Particulates	0.28	0.36	1.21
SO_2	Negligible	0.31	Negligible

Attachment K4

Documentation of Maximum Uncontrolled Hourly Emission Rates

Documentation of Maximum Uncontrolled Hourly Emission Rates

I. Introduction

For State Implementation Plans which provide for implementation, maintenance, and enforcement of a NAAQS, CAA §110(a)(2)(A) states that each implementation plan shall include enforceable emission limitations and other control measures, means, or techniques (including economic incentives such as fees, marketable permits, and auctions of emissions rights), as well as schedules and timetables for compliance, "as may be necessary or appropriate" to meet the applicable requirements of the Act. Because Eastman Chemical Company's Tennessee Operations includes a number of fuel-burning sources with low modeled impacts within the nonattainment area, Tennessee reviewed these emission rates to determine whether adoption of enforceable limits into the SIP was necessary or appropriate to provide for attainment of the NAAQS based on review of the following factors:

1. Hourly and annual emission rates;
2. Modeled impact;
3. Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels;

Collectively, SO_2 emissions from all small natural gas and oil-fired emission sources are summarized in **Table 1**:

Table 1: Summary of Emissions		
	Number of Sources	**Maximum Uncontrolled Hourly Emission Rate (lb/hr)**
Natural Gas (total)	45	3.83
#2 Oil	8	0.021
Other Process Emission Sources	2	0.34

For pipeline natural gas combustion sources, Tennessee calculated SO_2 emissions using an emission factor of 0.6 lb SO_2/MMSCF of natural gas combusted[1]. EPA's emission factor states, "*Emissions of SO_2 from natural gas-fired boilers are low because pipeline quality natural gas typically has sulfur levels of 2,000 grains per million cubic feet. However, sulfur-containing odorants are added to natural gas for detecting leaks, leading to small amounts of SO_2 emissions. Boilers combusting unprocessed natural gas may have higher SO_2 emissions due to higher levels of sulfur in the natural gas. For these units, a sulfur mass balance should be used to determine SO_2 emissions.*"

[1] U. S. EPA, *AP-42, Fifth Edition, Volume I Chapter 1: External Combustion Sources*, Table 1.4-2 (Emission Factors for Criteria Pollutants and Greenhouse Gases from Natural Gas Combustion).

II. Modifications to Increase Heat Input or Burn Alternative Fuels, Natural Gas-Fired Fuel Burning Sources

A common feature of process emission sources is the use of natural gas combustion for heat input[2]. For any process emission source, the design heat input is generally limited by the number and size of burners. Tennessee assumed that there is sufficient natural gas capacity for all process emission sources, and fuel supplies were not considered as a limiting factor. SO_2 emissions from natural gas combustion (excluding sources whose emissions are covered by a SIP limit and sources whose heat input is confidential business information) are 5.6 tons/year (the actual number would be higher, but not appreciably so, if confidential heat inputs were included). A doubling of heat input to all sources would double the SO_2 emission rate to 11.2 tons/year, but Eastman cannot simply install new burners or open a valve on the natural gas supply – a large increase in the heat input of a given would likely require rebuilding or replacement of the entire source. Large-scale increases in heat input would more likely to result from the construction of new fuel burning equipment or process emission sources, which would be subject to Nonattainment NSR (prior to redesignation), PSD (after redesignation of the area to attainment), or Tennessee's minor source preconstruction review.

It is possible, in theory, to increase emissions at a given source by burning alternative fuels, but Tennessee considers this an impractical alternative. Total fuel burning capacity at the facility (excluding sources whose emissions are covered by a SIP permit and sources whose heat input is confidential business information) is about 2,174 MMBtu/hr. If all natural gas combustion were replaced with No. 2 fuel oil containing no more than 15.5 parts per million by weight of sulfur, then SO_2 emissions from the facility would increase by 8.9 tons/year (the actual number would be higher, but not appreciably so, if confidential heat inputs were included). If the heat input remained unchanged, Eastman would need to receive and store 16,023 gallons per hour of fuel oil and deliver this oil to the individual processes. Delivery of No. 2 oil to sources that currently burn only natural gas would require the installation of an entirely new piping network because there is no large-scale ability to deliver fuel oil throughout the plant. Furthermore, Eastman would need to store sufficient fuel oil at the site to keep the plant operating, and the facility would need to construct a 400,000 gallon storage tank for 24 hours of storage capacity. By contrast, the facility has an existing infrastructure to deliver natural gas to the facility's process units, and no storage capacity is required, since natural gas largely operates on a just-in-time delivery basis. While No. 2 oil might be useful as a backup fuel for certain sources (e. g., natural gas-fired boilers), no such capacity currently exists at those sources.

In conclusion, while modification of an existing source would not be prohibited in the absence of individual SIP limits for small fuel burning or process emission sources, small modifications (e. g., physical changes that produces nominal increases in the design heat input rate) would have a negligible impact on SO_2 emission rates, and large-scale changes (fuel switching or plantwide increases in heat input capacity) appear impractical and/or not cost effective. Large-scale modifications are more likely to occur through the addition of new emission sources, which would be addressed through preconstruction review. In general, adoption of enforceable limits for these sources into the SIP is not necessary or appropriate to address future modifications of these sources.

[2] Some processes will use off-gas from another process (typically referred to as "fuel gas", "process gas", or "chemical fuel") where available. When process gas was identified as a fuel, Tennessee contacted Eastman and/or reviewed the fuel characteristics to confirm that the fuel contained no more sulfur than natural gas.

III. Natural Gas-Fired Fuel Burning Sources, Process Emission Sources, and Ovens

MSOP-02 Boilers 32, 33, and 34

Boilers 32, 33, and 34 were initially permitted in 2021 and are currently under construction. These boilers will replace the capacity of three coal-fired boilers (18, 19, and 20), but Tennessee did not count on these reductions to demonstrate attainment of the NAAQS.

Application Information: Construction permit 979100, application dated June 2, 2021, pages 2, 3, 4, 5, 6, and 7 of section PES B-83-11[3].

Hourly and Annual Emission Rates: Collectively, these three boilers have a maximum uncontrolled emission rate of 0.438 lb/hr, which is 0.026% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of 1.92 tons/year at unlimited operation, which is 0.057% of the 2022 facility emissions (3,368.1 tons/year) and 0.027% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with this emission rate is based upon the design heat input capacity of the boilers and fuel usage restrictions[4], and no controls are used to limit SO_2 emissions from the boilers.

Modeled Impact: The modeled impact of Boilers 32, 33, and 34 was assessed using the worst-case run (2022-0927-07), and the overall impact (0.170 μg/m^3) was low (0.090%) relative to the overall impact (all modeled sources) of 189.3 μg/m^3. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 μg/m^3), with a modeled impact of only 0.086% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 μg/m^3)[5], and the modeled impact of the boilers remained unchanged at 0.086% of the NAAQS.

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: The design heat input of each boiler is 249 MMBtu/hr, and the application for these sources indicates that natural gas is the only fuel burned. The boilers are not permitted to burn alternative fuels, and the application indicates no capacity to store, feed, or burn other fuels (e. g., there are no fuel oil storage tanks associated with the boilers). The application indicates that these units are package boilers, which follow a standard design, and the maximum heat input capacity would be limited by design of the burners, boiler tubes, and associated equipment (e. g., steam drum and mud drum).

---

[3] Eastman Chemical Company's Title V applications are submitted by Major Source Operating Permit (MSOP) and are subdivided by Permitted Emission Source (PES). The numbering of each section restarts with the first page. For example, the information for gas-fired boilers 32, 33, and 34 may be found in the application for MSOP-02 dated June 2, 2021, section PES B-83-11, pages 2 through 7. Each PES is further subdivided into application forms and supporting calculations. Pages numbered with Arabic numerals indicate application forms, while pages numbered as "C-1, C-2, etc." refer to the calculations section of the PES.

[4] A fuel usage restriction may be an enforceable limitation in the permit, or it may be a logical result of the design and construction of the source. For example, a natural gas-fired boiler that contains no infrastructure to burn No. 2 oil is limited to natural gas combustion based on the design of the source, and a permit condition is not required to prohibit the use of alternative fuels. Tennessee's preconstruction program (TAPCR 1200-03-09-.01) would prohibit the modification of the emission source without preconstruction review to ensure that the modification will not cause or contribute to a violation of the NAAQS.

[5] Tennessee reviewed the impact of each source on modeled receptors greater than 75% of the NAAQS because the effect of SO_2 emissions is not uniform throughout the nonattainment area, and a small emission source may need to be included in the SIP if it's air quality impact occurs disproportionately in areas with higher concentrations of SO_2 in the ambient air.

Tennessee concludes that adoption of enforceable limits for these sources into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the boilers, the negligible impact of the boilers upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels.

MSOP-03 Catalyst Recovery Process Vent (PES B-338-3 Plant 23 Incinerator)

The incinerator in PES-338 has a design heat input capacity of 8 MMBtu/hr. There are three feeds into the incinerator – air, natural gas, and a confidential mixture of tar produced in the PES 337 and PES 352 acetic anhydride plants. The incinerator is designed to convert the tar to ash and to produce iodine. The natural gas fed to the incinerator is limited to a 24-hour average < 121 lb/hr. The flue gas goes through a heat exchanger for cooling, then a series of dust collectors and finally a recovery scrubber before venting to Vent A. The recovery scrubber prior to Vent A controls iodine production from the tar mixture. The only sulfur present in the flue gas is attributed to the natural gas sent to the incinerator, and there should be no sulfur compounds present in the tar mixture.

Application Information: Title V Operating Permit 573862, application dated February 23, 2018, pages 2, 4, and C-3 of section PES B-338-3.

Hourly and Annual Emission Rates: The catalyst recovery process has a maximum uncontrolled emission rate of 0.002 lb/hr, which is 0.00012%of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of 0.00876tons/year at unlimited operation, which is 0.00026% of the 2022 facility emissions (3,368.1 tons/year) and 0.00012% of the facility's projected 2037 emissions (7,339.1 tons/year). No controls are used to limit SO_2 emissions from the process.

Modeled Impact: The modeled impact of the catalyst recovery process vent was assessed using the worst-case run (2022-0927-07), and the overall impact (0.149 $\mu g/m^3$) was low (0.080%) relative to the overall impact (all modeled sources) of 189.3 $\mu g/m^3$. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 $\mu g/m^3$), with a modeled impact of only 0.076% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 $\mu g/m^3$), and the modeled impact of the source remained unchanged at 0.076% of the NAAQS.

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: The design heat input capacity for the recovery process is 2.75 MMBtu/hr, and the unit only burns natural gas for fuel and "tar" (a process stream from the coal gasification plant) to recover material from the stream. There is no sulfur in the tar, and SO_2 emissions are solely from natural gas combustion. Natural gas is burned during startup and to periodically clean the unit, but the emission calculations for this source assumed that natural gas is burned at all times. The catalyst recovery process is not permitted to burn alternative fuels, and the application indicates no capacity to store, feed, or burn other fuels.

Tennessee concludes that adoption of enforceable limits for this source into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2

emissions from the catalyst recovery process, the negligible impact of the process upon modeled attainment, and the inability of the facility to modify the source in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

MSOP-11 and MSOP-24 Heat Transfer Media (HTM) Furnaces

Eastman Chemical Company's Heat Transfer Media (HTM) furnaces use natural gas to heat a circulating heat transfer fluid (e. g., Dowtherm) for circulation through the facility's manufacturing. The MSOP-11 furnaces were installed in 1959 (Furnaces 3 and 4) and 1965 (Furnaces 5, 6, 7, 8, 9, and 10), and the MSOP-24 furnaces were installed in 2000 (Furnaces MF-01 and MG-01), 2004 (Furnace MK-01), and 2018 (Furnace ML-01).

Application Information (MSOP-11): Title V Operating Permit 573592, application dated November 2, 2021, pages 2, 3, 4, 5, 6, and 7 of section PES B-256-1,2,3. Title V Operating Permit 573592, application dated November 2, 2021, pages 2, 3, 4, 5, 6, and 7 of section PES B-272-1,2,3.

Application Information (MSOP-24): Title V Operating Permit 576162, application dated January 18, 2019, pages 2, 3, 4, 5, 6, 7, 8, 9, 10, and 11 of section PES B-238-1.

Hourly and Annual Emission Rates: Collectively, the MSOP-11 furnaces have a maximum uncontrolled emission rate of 0.091 lb/hr, which is 0.0054% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of 0.40 tons/year at unlimited operation, which is 0.012% of the 2022 facility emissions (3,368.1 tons/year) and 0.0054% of the facility's projected 2037 emissions (7,339.1 tons/year). The MSOP-24 furnaces have a maximum uncontrolled emission rate of 0.125 lb/hr, which is 0.0074% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of 0.55 tons/year at unlimited operation, which is 0.016% of the 2022 facility emissions (3,368.1 tons/year) and 0.0075% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with these emission rates is based upon the design heat input capacity of the furnaces and fuel usage restrictions, and no controls are used to limit SO_2 emissions from the furnaces.

Modeled Impact: The modeled impact of the HTM furnaces was assessed using the worst-case run (2022-0927-07), and the overall impact (0.694 $\mu g/m^3$) was low (0.37%) relative to the overall impact (all modeled sources) of 189.3 $\mu g/m^3$. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 $\mu g/m^3$), with a modeled impact of only 0.35% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 $\mu g/m^3$), and the modeled impact of the HTM furnaces remained unchanged at 0.35% of the NAAQS.

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: The design heat input of each HTM furnace in MSOP-11 ranges from 14 MMBtu/hr to 21.5 MMBtu/hr, and collectively, the design heat input of all MSOP-11 furnaces is 155.5 MMBtu/hr. The heat input capacities of the MSOP-24 furnaces are protected as confidential business information, and the design heat input capacities were submitted to U. S. EPA for direct review. The HTM furnaces are not permitted to burn alternative fuels, and the application indicates no capacity to store, feed, or burn other fuels.

Tennessee concludes that adoption of enforceable limits for these sources into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the furnaces, the negligible impact of these sources upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

MSOP-16 Cracking Furnaces

Eastman operates 22 cracking furnaces, which were installed between 1933 and 1986 (**Table 2**). These furnaces produce ketene (an intermediate step in the production of acetic anhydride) via thermal cracking of acetic acid. These furnaces burn natural gas and chemical fuel (which contains no sulfur) as fuels.

Table 2: MSOP-16 Cracking Furnaces

Application Information: Title V Operating Permit 576946, application dated May 28, 2019, pages 2, 3, 4, 5, and 6 of section PES B-6C-1. Title V Operating Permit 576946, application dated May 28, 2019, pages 2, 3, 4, 5, 6, and 7 of section PES B-7R-1. Title V Operating Permit 576946, application dated May 28, 2019, pages 2, 3, 4, 5, and 6 of section PES B-7RC-1.

Hourly and Annual Emission Rates: Furnace emissions are shown in **Table 3**. Collectively, the MSOP-16 cracking furnaces have a maximum uncontrolled emission rate of 0.169 lb/hr, which is 0.010% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of 0.74 tons/year at unlimited operation, which is 0.022% of the 2022 facility emissions (3,368.1 tons/year) and 0.010% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with these emission rates is based upon the design heat input capacity of the furnaces and fuel usage restrictions, and no controls are used to limit SO_2 emissions from the furnaces.

Table 3: Review of MSOP-16 Cracking Furnace Emissions					
Description	**Max. Uncontrolled Emission Rate (lb/hr)**	**% of Modeled Total**	**Annual Emissions (tons/year)**	**% of 2022 Inventory Total**	**% of 2037 Inventory Total**

Cracking Furnaces #25 and #26	0.018	0.0011%	0.079	0.0023%	0.0011%
Cracking Furnace #26	0.008	0.0005%	0.035	0.0010%	0.0005%
All Sources	**0.169**	**0.010%**	**0.74**	**0.022%**	**0.010%**

Modeled Impact: The modeled impact of the cracking furnaces was assessed using the worst-case run (2022-0927-07), and the overall impact (0.078 $\mu g/m^3$) was low (0.041%) relative to the overall impact (all modeled sources) of 189.3 $\mu g/m^3$. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 $\mu g/m^3$), with a modeled impact of only 0.040% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 $\mu g/m^3$), and the modeled impact of the HTM furnaces remained unchanged at 0.040% of the NAAQS.

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: The design heat input of each cracking furnace in MSOP-16 ranges from 9.9 MMBtu/hr to 25 MMBtu/hr, and collectively, the design heat input of all cracking furnaces is 272.3 MMBtu/hr. The cracking furnaces are not permitted to burn alternative fuels, and the application indicates no capacity to store, feed, or burn other fuels.

Tennessee concludes that adoption of enforceable limits for these sources into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the furnaces, the negligible impact of these sources upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

MSOP-16 Diketene Furnaces and Thermal Oxidizer (PES Area A-B7)

The diketene furnaces designated as PES Area A-B7 were last modified in 1993 and were owned/operated by Holston Army Ammunition Plant until 2016. These furnaces were idled until 2016, when Eastman Chemical Company took over operation of the source. These furnaces produce diketene produced by cracking of

purchased acetic acid for conversion to acetic anhydride. There are ten furnaces (Furnaces #17 through #26) with a design heat input capacity of 4.0 MMBtu/hr each, and natural gas is the only fuel burned by the furnaces. Area A-B7 also includes a natural gas-fired thermal oxidizer with a maximum design heat input capacity of 7.4 MMBtu/hr to control VOC and carbon monoxide emissions from the process.

Application Information: Title V Operating Permit 576946, application dated May 28, 2019, pages 2, 3, 4, 7, 8, 9, 10, 11, 12, 13, 14, 15, and 16 of PES Area A-B7 (ketene furnaces) and pages 2, 3, 5, and 43 of PES Area A-B7 (thermal oxidizer).

Hourly and Annual Emission Rates: The diketene furnaces and thermal oxidizer have a maximum uncontrolled emission rate of 0.028 lb/hr, which is 0.002% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of 0.12 tons/year at unlimited operation, which is 0.004% of the 2022 facility emissions (3,368.1 tons/year) and 0.002% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with these emission rates is based upon the design heat input capacity of the furnaces and fuel usage restrictions, and no controls are used to limit SO_2 emissions from the furnaces.

Modeled Impact: The modeled impact of the diketene furnaces and thermal oxidizer was assessed using the worst-case run (2022-0927-07), and the overall impact (0.021 $\mu g/m^3$) was low (0.011%) relative to the overall impact (all modeled sources) of 189.3 $\mu g/m^3$. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 $\mu g/m^3$), with a modeled impact of only 0.010% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 $\mu g/m^3$), and the modeled impact of the HTM furnaces remained unchanged at 0.010% of the NAAQS.

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: The design heat input of each diketene furnace in MSOP-16 is 4.0 MMBtu/hr, and the design heat input of the source (10 furnaces and thermal oxidizer) is 47.4 MMBtu/hr. The furnaces and thermal oxidizer are not permitted to burn alternative fuels, and the application indicates no capacity to store, feed, or burn other fuels.

Tennessee concludes that adoption of enforceable limits for these sources into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the furnaces, the negligible impact of these sources upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

MSOP-19 Copolyester Monomer Manufacturing (PES B-545-1)

PES B-545-1 is a process unit that manufactures monomers for downstream copolyester manufacturing. The process includes two process heaters (FA-F-01 and FB-F-01), which are rated at 24.5 MMBtu/hr each, and emissions from the source are controlled by a 22 MMBtu/hr vapor incinerator. Natural gas is the only fuel used for the process heaters and control device, and there no add-on controls are used to reduce SO_2 emissions.

Application Information: Title V Operating Permit 575805, application dated December 5, 2018, pages 3, 4, 5, 7, 8, 9, 18, and C-6 of section PES B-545-1.

Hourly and Annual Emission Rates: The process heaters and vapor incinerator have a maximum uncontrolled emission rate of 0.041 lb/hr, which is 0.002% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of 0.18 tons/year at unlimited operation, which is 0.005% of the 2022 facility emissions (3,368.1 tons/year) and 0.002% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with these emission rates is based upon the design heat input capacity of the process heaters and control device and on fuel usage restrictions, and no controls are used to limit SO_2 emissions from the furnaces.

Modeled Impact: The modeled impact of the diketene furnaces and thermal oxidizer was assessed using the worst-case run (2022-0927-07), and the overall impact (0.040 µg/m^3) was low (0.021%) relative to the overall impact (all modeled sources) of 189.3 µg/m^3. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 µg/m^3), with a modeled impact of only 0.020% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 µg/m^3), and the modeled impact of the HTM furnaces remained unchanged at 0.020% of the NAAQS.

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: The design heat input of each process heater is 24.5 MMBtu/hr, and the design heat input of the vapor incinerator is 22 MMBtu/hr. The process heaters and vapor incinerator are not permitted to burn alternative fuels, and the application indicates no capacity to store, feed, or burn other fuels.

Tennessee concludes that adoption of enforceable limits for these sources into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the process heaters and control device, the negligible impact of the process heaters upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

MSOP-24 Hydrogen Plants 3, 4, 5 and 6 (PES H2 Plants)

Eastman's hydrogen plants produce hydrogen gas via steam reforming of methane. Natural gas and steam are fed to each reactor, and hydrogen is produced by the following reactions:

$$CH_4 + H_2O \rightarrow CO + 3H_2$$
$$CO + H_2O \rightarrow CO_2 + H_2$$

Natural gas and fuel gas (a mixture of methane, methanol, and other VOCs) are burned to supply heat to the reactors, and a small quantity of SO_2 is emitted as a result of fuel combustion. No add-on controls are used to reduce SO_2 emissions.

Application Information: Title V Operating Permit 576162, application dated January 18, 2019, pages 2, 3, 4, 5, 7, 8, 9, 10, 11, 12, 13, 14, and 15 of section PES H2 Plants.

Hourly and Annual Emission Rates: The hydrogen plants have a maximum uncontrolled emission rate of 0.219 lb/hr, which is 0.013% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of 0.96 tons/year at unlimited operation, which is 0.028% of the 2022 facility emissions (3,368.1 tons/year) and 0.013% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with these emission rates is based upon the design heat input capacity of the hydrogen plants and on fuel usage restrictions, and no controls are used to limit SO_2 emissions from the source.

Modeled Impact: Hydrogen Plants 3, 4, and 5 were modeled separately from Hydrogen Plant 6. The modeled impact of Hydrogen Plants 3, 4, and 5 was assessed using the worst-case run (2022-0927-07), and the overall impact (0.072 μg/m^3) was low (0.038%) relative to the overall impact (all modeled sources) of 189.3 μg/m^3. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 μg/m^3), with a modeled impact of only 0.038% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 μg/m^3), and the modeled impact of the Hydrogen Plants 3, 4, and 5 was slightly lower at 0.037% of the NAAQS.

The modeled impact of the Hydrogen Plant 6 was assessed using the worst-case run (2022-0927-07), and the overall impact (0.019 μg/m^3) was low (0.010%) relative to the overall impact (all modeled sources) of 189.3 μg/m^3. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 μg/m^3), with a modeled impact of only 0.010% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 μg/m^3), and the modeled impact of Hydrogen Plant 6 remained unchanged at 0.010% of the NAAQS.

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: The design heat input of capacities of Hydrogen Plants 3, 4, 5, and 6 are protected as confidential business information, and the design heat input capacities were submitted to U. S. EPA for direct review. The hydrogen plants are not permitted to burn alternative fuels, and the application indicates no capacity to store, feed, or burn other fuels.

Tennessee concludes that adoption of enforceable limits for these sources into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the hydrogen plants, the negligible impact of the hydrogen plants upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

MSOP-26 Gas-Fired Auxiliary Boilers (PES B-423-1)

Boilers 32, 33, and 34 were constructed in 1991 and are used as backup units to generate steam during planned or unplanned outages of the B-83, B-253, or B-325 powerhouses. Condition 13 of PSD construction permit 955445F (issued June 1, 2002) allows only natural gas to be used as fuel for the boilers. No add-on controls are used to reduce SO_2 emissions.

Application Information: Title V Operating Permit 576501, application dated February 14, 2020, pages 2, 3, 4, 5, 6, and 7 of section PES B-423-1.

Hourly and Annual Emission Rates: Collectively, these three boilers have a maximum uncontrolled emission rate of 0.399 lb/hr (0.133 lb/hr for each boiler), which is 0.024% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of 1.75 tons/year at unlimited operation, which is 0.052% of the 2022 facility emissions (3,368.1 tons/year) and 0.024% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with this emission rate is based upon the design heat input capacity of the boilers and fuel usage restrictions, and no controls are used to limit SO_2 emissions from the boilers.

Modeled Impact: The modeled impact of Boilers 32, 33, and 34 was assessed using the worst-case run (2022-0927-07), and the overall impact (1.38 $\mu g/m^3$) was low (0.73%) relative to the overall impact (all modeled sources) of 189.3 $\mu g/m^3$. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 $\mu g/m^3$), with a modeled impact of only 0.70% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 $\mu g/m^3$), and the modeled impact of the boilers remained unchanged at 0.70% of the NAAQS.

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: The design heat input of each boiler is 226 MMBtu/hr, and the PSD construction permit allows only natural gas to be burned as fuel for the source.

Tennessee concludes that adoption of enforceable limits for these sources into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the boilers, the negligible impact of the boilers upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

MSOP-27 Burnout Oven (PES B-190-1)

Eastman's plastics compounding facility (B-190-1) includes a dual-chamber oven, which is used for cleaning of metal parts. Natural gas is the only fuel used for the oven, and no add-on controls are used to reduce SO_2 emissions.

Application Information: Title V Operating Permit 574985, application dated September 19, 2018, pages 2, 3, 9, 15, C-12, C-20, C-21 of section PES B-190-1.

Hourly and Annual Emission Rates: The oven has a maximum uncontrolled emission rate of 0.00021 lb/hr, which is 0.00001% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of 0.00090 tons/year at unlimited operation, which is 0.0003% of the 2022 facility emissions (3,368.1 tons/year) and 0.002% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with these emission rates is based upon the design heat input capacity of the process heaters and control device and on fuel usage restrictions, and no controls are used to limit SO_2 emissions from the furnaces.

Modeled Impact: The modeled impact of the parts cleaning oven was assessed using the worst-case run (2022-0927-07), and the overall impact (0.20 µg/m^3) was low (0.11%) relative to the overall impact (all modeled sources) of 189.3 µg/m^3. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 µg/m^3), with a modeled impact of only 0.10% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 µg/m^3), and the modeled impact of the HTM furnaces remained unchanged at 0.10% of the NAAQS.

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: The design heat input of the oven is 0.35 MMBtu/hr. The oven is not permitted to burn alternative fuels, and the application indicates no capacity to store, feed, or burn other fuels.

Tennessee concludes that adoption of enforceable limits for this source into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the oven, the negligible impact of the oven upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

MSOP-31 HTM Furnaces (PES B-265B-1)

Eastman Chemical Company's Heat Transfer Media (HTM) furnaces use natural gas to heat a circulating heat transfer fluid (e. g., Dowtherm) for circulation through the facility's manufacturing processes. These furnaces were installed in 1957 (Furnace SM-02) and 1986 (Furnace SM-01).

Application Information: Title V Operating Permit 576485, application dated October 11, 2019, pages 4, 5, 6, and 7 of section PES B-265B-1.

Hourly and Annual Emission Rates: The MSOP-31 furnaces have a maximum uncontrolled emission rate of 0.0065 lb/hr (combined total for both furnaces), which is 0.00039% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of 0.029 tons/year at unlimited operation, which is 0.0085% of the 2022 facility emissions (3,368.1 tons/year) and 0.00039% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with these emission rates is based upon the design heat input capacity of the furnaces and fuel usage restrictions, and no controls are used to limit SO_2 emissions from the furnaces.

Modeled Impact: The modeled impact of the HTM furnaces was assessed using the worst-case run (2022-0927-07), and the overall impact (0.020 µg/m^3) was low (0.011%) relative to the overall impact (all modeled sources) of 189.3 µg/m^3. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 µg/m^3), with a modeled impact of only 0.010% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 µg/m^3), and the modeled impact of the HTM furnaces remained unchanged at 0.010% of the NAAQS.

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: The design heat input of Furnace SM-01 is 4.9 MMBtu/hr, and the design heat input of Furnace SM-02 is 6.2 MMBtu/hr. The HTM furnaces are not permitted to burn alternative fuels, and the application indicates no capacity to store, feed, or burn other fuels.

Tennessee concludes that adoption of enforceable limits for these sources into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the furnaces, the negligible impact of these sources upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

MSOP-34 Control Devices for TPA/IPA Production (PES B-232-1)

Eastman's organic acids process unit produces terephthalic acid (TPA) and isophthalic acid (IPA) via the oxidation of para-xylene and meta-xylene, respectively. The process vents are subject to the requirements of 40 CFR 63 Subpart G (National Emission Standards for Hazardous Air Pollutants From the Synthetic Organic Chemical Manufacturing Industry for Process Vents, Storage Vessels, Transfer Operations, and Wastewater), and the process contains halogenated Group 1 process vents (reduce organic HAP emissions by 98% or to an outlet concentration of 20 ppmv, reduce emissions of halogens and hydrogen halides by 95% or to less than 0.45 kg/hr (**Table 4**). The VOC/HAP control devices burn natural gas as fuel. While all three process vents use a wet scrubber as the final control device, SO_2 emissions were based on the pre-control emission rate, and no SO_2 removal was assumed for the scrubbers.

Table 4: Control Devices for TPA/IPA Process Unit (MSOP-32)

Vent ID	VOC/HAP Control Device	Halogen Control Device
UA	Catalytic Oxidizer	Wet Scrubber
UB	Regenerative Thermal Oxidizer	Wet Scrubber
UC	Catalytic Oxidizer	Wet Scrubber

Application Information: Title V Operating Permit 576931, application dated April 14, 2022, pages 18, 19, 20, 39, 40, and 41 of section PES B-232-1.

Hourly and Annual Emission Rates: The MSOP-34 control devices have a maximum uncontrolled emission rate of 0.012 lb/hr (combined total for all three control devices), which is 0.00071% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of

0.053 tons/year at unlimited operation, which is 0.0016% of the 2022 facility emissions (3,368.1 tons/year) and 0.00072% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with these emission rates is based upon the design heat input capacities of the control devices and fuel usage restrictions. While some SO_2 removal occurs in the wet scrubbers, the modeling of these sources assumed that no controls are used to limit SO_2 emissions from the process vents.

Modeled Impact: The modeled impact of the HTM furnaces was assessed using the worst-case run (2022-0927-07), and the overall impact (0.0085 µg/m^3) was low (0.005%) relative to the overall impact (all modeled sources) of 189.3 µg/m^3. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 µg/m^3), with a modeled impact of only 0.005% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 µg/m^3), and the modeled impact of the control devices was slightly lower at 0.004% of the NAAQS.

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: The design heat input of each control device is shown in **Table 5**. The MSOP-34 control devices are not permitted to burn alternative fuels, and the application indicates no capacity to store, feed, or burn other fuels.

Table 5: Design Heat Input of MSOP-34 Control Devices

Description	Design Heat Input (MMBtu/hr)
Vent UA Catalytic Oxidizer	3.26
Vent UB Regenerative Thermal Oxidizer	13.57
Vent UC Catalytic Oxidizer	3.26

Tennessee concludes that adoption of enforceable limits for these sources into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the catalytic oxidizers and regenerative thermal oxidizer, the negligible impact of these sources upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

MSOP-36 Methanolysis Plant Furnace (PES B-655-1)

Eastman's methanolysis plant processes polyethylene terephthalate (PET) waste from an upstream process unit to recover the corresponding monomers (dimethyl terephthalate and ethylene glycol). The source includes a natural gas-fired HTM furnace, which is also used to control VOC and organic HAP emissions from the process unit.

Application Information: Construction permit 981591, application dated August 3, 2023, pages 2, 3, and 4 of section PES B-655-1.

Hourly and Annual Emission Rates: The methanolysis plant furnace has a maximum uncontrolled emission rate of 0.099 lb/hr, which is 0.00058% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly emission rate corresponds to annual emissions of 0.029 tons/year at unlimited operation, which is 0.013% of the 2022 facility emissions (3,368.1 tons/year) and 0.0059% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with these emission rates is based upon the design heat input capacity of the furnaces and fuel usage restrictions, and no controls are used to limit SO_2 emissions from the furnace.

Modeled Impact: The modeled impact of the methanolysis plant furnace was assessed using the worst-case run (2022-0927-07), and the impact (0.067 µg/m^3) was low (0.035%) relative to the overall impact (all modeled sources) of 189.3 µg/m^3. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 µg/m^3), with a modeled impact of only 0.034% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 µg/m^3), and the modeled impact of the HTM furnaces remained unchanged at 0.034% of the NAAQS.

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: The design heat input of the furnace is 169 MMBtu/hr. The methanolysis plant furnace is not permitted to burn alternative fuels, and the application indicates no capacity to store, feed, or burn other fuels.

Tennessee concludes that adoption of enforceable limits for this source into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the furnaces, the negligible impact of these sources upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

IV. Other Process Emission Sources

MSOP-10 TBHQ Production (PES B-90-7)

MSOP-10 includes a process for the manufacture of t-butyl hydroquinone (TBHQ) by the reaction of hydroquinone with proprietary ingredients, and a small quantity of SO_2 is produced by the reaction. The application states that a stoichiometric amount of SO_2 is added to the process[6], and the SO_2 emission rate is based on the current production rate.

Application Information: Title V Operating Permit 573610, application dated September 13, 2019, pages 6, 8, C-5, C-6, C-7, C-8, and C-9 of section PES B-90-7.

Hourly and Annual Emission Rates: The TBHQ process has a maximum uncontrolled emission rate of 0.03 lb/hr, which is 0.00018% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The hourly

[6] SO2 is not added directly but is generated *in situ* by the addition of another reagent.

emission rate corresponds to annual emissions of 0.13 tons/year at unlimited operation, which is 0.004% of the 2022 facility emissions (3,368.1 tons/year) and 0.0018% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with emission rates is based upon the maximum TBHQ production rate and the addition of stoichiometric quantity of SO_2 to the reaction mixture (i. e., all of the added sulfur dioxide is reacted rather than emitted).

Modeled Impact: The modeled impact of the TBHQ process was assessed using the worst-case run (2022-0927-07), and the impact (0.31 µg/m^3) was low (0.17%) relative to the overall impact (all modeled sources) of 189.3 µg/m^3. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 µg/m^3), with a modeled impact of only 0.16% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 µg/m^3), and the modeled impact of the HTM furnaces remained unchanged at 0.16% of the NAAQS.

Design capacity, ability of the source to increase its emission rate: The design capacity of the TBHQ process is protected as confidential business information, and the supporting information was submitted to U. S. EPA for direct review. As noted above, the emission rate is based on stoichiometric addition of SO_2 to the process and the allowance of sufficient mixing time to ensure that all SO_2 is reacted.

Tennessee concludes that adoption of enforceable limits for this source into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the furnaces, the negligible impact of these sources upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

MSOP-10 BHA Production (PES B-90B-1)

The current Title V permit for MSOP-10 (573610) includes a process for the manufacture of butylated hydroxyanisole (BHA), but Eastman submitted a Title V renewal application (581022) dated January 10, 2023, which indicates that BHA is no longer in production. This source will be removed in the facility's next Title V renewal.

MSOP-17 Fugitive Equipment Leaks, Acid Gas Removal and Sulfur Recovery (PES B-334-1)

Title V Operating Permit 572407 (MSOP-17) requires a leak inspection of all equipment in sulfur dioxide service (piping, pumps, compressors, pressure relief devices, sampling connection systems, open-ended valves or lines, valves, and flanges that contain or contact a process fluid that is at least 10% SO_2 by weight, excluding equipment in heavy liquid service[7] or in vacuum service[8]) to be performed once per calendar year using audible, visual, and olfactory (AVO) methods as appropriate. Eastman's permit application estimates 1.30

[7] "In heavy liquid service" means when less than 20 weight percent of the process fluid consists of air contaminants having pure component vapor pressures greater than 0.044 psia at 68 degrees F, and the process fluid is not in the gaseous state at operating conditions.

[8] "In vacuum service" means equipment that is operating at an internal pressure which is at least 0.7 psia below ambient pressure.

tons/year of fugitive SO_2 emissions, and the annual emissions are estimated based on average emission factors developed by U. S. EPA or site-specific factors developed by Eastman Chemical Company, and on the equipment counts for different release points in SO_2 service (**Table 6**).

Table 6: MSOP-17 Fugitive Emission Sources (PES B-334-1)	
Equipment Type	**Equipment Count**
Valves in gas/vapor service	166
Connectors in gas/vapor or light liquid service	780
Compressors in gas/vapor service	1
Open-ended lines	4

Application Information: Title V Operating Permit 572407, application dated May 5, 2022, page C-19 of section PES B-334-1.

Hourly and Annual Emission Rates: Annual SO_2 emissions from fugitive equipment leaks are estimated as 1.45 tons/year based on emission factors developed by Eastman Chemical Company[9]. Estimated annual emissions from fugitive equipment leaks equate to an hourly emission rate of 0.33 lb/hr (0.042 g/s)[10].

Modeled Impact: The modeled impact of the coal gasification fugitive emissions was assessed using the worst-case run (2022-0927-07), and the impact (1.35 µg/m^3) was low (0.71%) relative to the overall impact (all modeled sources) of 189.3 µg/m^3. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 µg/m^3), with a modeled impact of only 0.69% of the NAAQS. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 µg/m^3), and the modeled impact of the HTM furnaces remained unchanged at 0.69% of the NAAQS.

Design capacity, ability of the source to increase its emission rate: Fugitive equipment leaks are quantified in the modeling because even a well-maintained process unit can experience leaking through pumps, valves, flanges, compressors, and other equipment, but fugitive equipment leaks cannot be quantified through traditional design capacity methods – when fugitive emission points are added to the process, the equipment leak rate will vary from zero (well-maintained, regularly monitored equipment) to a high emission rate (excess emissions due to a serious malfunction event).

Tennessee reviewed the last five years of equipment leak inspections, as summarized in Eastman's Title V semiannual reports (**Table 7**) and found that Eastman had identified no leaking equipment in the acid gas removal and sulfur recovery processes during that period. Tennessee concludes that adoption of enforceable limits for this source into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the furnaces, the negligible impact of these

[9] The application states that these emission factors were developed from a 1994/1995 screening study based on EPA Method 21 screening and correlation equation methodology (EPA-453/R-93-026, "Protocol for Equipment Leak Emission Estimates", June 1993).

[10] Fugitive equipment leaks are modeled as a rectangular area source with length X of 1353.312 m, Length Y of 1792.224 m, and a rotation angle of 89 degrees relative to north-south orientation, and AERMOD modeled an emission rate of 1.72 x 10^{-8} g/s per square meter of area (0.042 g/s divided by the area dimensions).

sources upon modeled attainment, and the inability of the facility to modify the sources in a manner that would increase SO_2 emissions.

Table 7: MSOP-17 Summary of Equipment Leak Monitoring

V. #2 Oil-Fired Emergency Engines (MSOP-11, MSOP-29, MSOP-32)

Eastman operates two fire pump engines and six emergency engines that are fueled by No. 2 fuel oil and are used in different locations throughout the plant for backup power or emergency response (**Table 8**).

Table 8: No. 2 Oil-Fired Engines				
MSOP	**PES**	**Description**	**Design Heat Input (MMBtu/hr)**	**Max. Uncontrolled SO_2 Emission Rate (lb/hr)**
11	RICE-2	B-63 Fire Pump	1.78	2.70E-03
11	RICE-2	B-269 Fire Pump	1.3	1.97E-03
29	RICE-1	B-456 Emergency Engine (Vent A)	3.79	5.76E-03
29	RICE-1	B-310 Emergency Engine (Vent H)	1.18	1.79E-03
29	RICE-1	B-300 Emergency Engine (Vent I)	0.09	1.37E-04
29	RICE-1	B-54D Emergency Engine (Vent K)	2.21	3.36E-03
29	RICE-1	B-280 Emergency Engine (Vent P)	0.55	8.35E-04
32	RICE-3	B-427 Emergency Engine	2.79	4.24E-03

Application Information (MSOP-11): Title V Operating Permit 573592, application dated August 27, 2018, pages 2, 3, 4, and 5 of section PES-RICE-2.

Application Information (MSOP-29): Title V Operating Permit 574111, application dated December 18, 2019, pages 2, 8, 9, 11, 15, 21, 22, 24, and 27 of section PES-RICE-1.

Application Information (MSOP-32): Title V Operating Permit 576926, application dated May 24, 2019, pages 2 and 3 of section PES-RICE-3.

Hourly and Annual Emission Rates: Collectively, these engines have a maximum uncontrolled emission rate of 0.021 lb/hr, which is 0.0012% of the hourly emission rate modeled in run 2022-0129-7 (1694.95 lb/hr). The

hourly emission rate corresponds to annual emissions of 0.092 tons/year at unlimited operation, which is 0.0027% of the 2022 facility emissions (3,368.1 tons/year) and 0.027% of the facility's projected 2037 emissions (7,339.1 tons/year). Compliance with this emission rate is based upon the design heat input capacity of the engines and fuel usage restrictions[11], and no controls are used to limit SO_2 emissions from the boilers.

Modeled Impact: The modeled impact of the engines was assessed using the worst-case run (2022-0927-07), and the overall impacts (0.00928 μg/m^3 for the fire pump engines and 0.00972 μg/m^3 for the emergency engines) were low (0.005% for both the fire pump engines and the emergency engines) relative to the overall impact (all modeled sources) of 189.3 μg/m^3. The modeled impact was also low relative to the NAAQS (75 ppb, calculated for modeling purposes as 196.5 μg/m^3), with a modeled impact of only 0.005% of the NAAQS for both the fire pump engines and emergency engines. As an additional check on the impact of this source, Tennessee considered the impact of the source on modeled receptors where the overall impact was greater than 75% of the NAAQS (i. e., all receptors where the modeled impact of all emission sources was greater than 147.38 μg/m^3)[12], and the modeled impact of the boilers remained unchanged at 0.005% of the NAAQS (both sources).

Design capacity, ability of the source to increase its emission rate through changes in design capacity or burning of alternate fuels: Stationary engines are package units that are not easily modified (you would buy a new unit rather than increase the capacity of an existing unit). Compression ignition (CI) engines ignite the fuel via the heat generated from compression of the combustion air rather than from an external source (e. g., a spark plug) and are generally designed to burn No. 2 oil rather than residual oil (No. 4, 5, or 6 fuel oils) or lighter hydrocarbons (natural gas, gasoline, or No. 1 fuel oil). Beginning in 2006, EPA phased in new sulfur content requirements for onroad and nonroad diesel fuel, and after 2014, all onroad and nonroad diesel sold in the United States must be ultra-low sulfur diesel (15 parts per million by weight)[13].

Tennessee concludes that adoption of enforceable limits for these sources into the SIP is not necessary or appropriate to meet the applicable requirements of the Act for redesignation based upon the minimal SO_2 emissions from the boilers, the negligible impact of the boilers upon modeled attainment, and the inability of the facility to modify the engines in a manner that would increase SO_2 emissions through increases in the design capacity or combustion of alternative fuels. The fuel usage and design capacity restrictions identified in this section are inherent to the design of the source, and the permit imposes no additional restrictions that would limit the source's maximum hourly emission rate.

[11] 40 CFR §1090.305 requires diesel fuel to meet the ultra-low sulfur diesel per-gallon standards, including a maximum sulfur content of 15 ppm.

[12] Tennessee reviewed the impact of each source on modeled receptors greater than 75% of the NAAQS because the effect of SO_2 emissions is not uniform throughout the nonattainment area, and a small emission source may need to be included in the SIP if it's air quality impact occurs disproportionately in areas with higher concentrations of SO_2 in the ambient air.

[13] See 40 CFR §1090.305.

Public Hearing Notice

NOTICE OF HEARING

TENNESSEE DEPARTMENT OF ENVIRONMENT AND CONSERVATION
DIVISION OF AIR POLLUTION CONTROL
DAVY CROCKETT TOWER
500 JAMES ROBERSTON PARKWAY, 7th FLOOR
NASHVILLE, TENNESSEE 37243
PHONE: (615) 532-0554 FAX: (615) 532-0614

NOTICE IS HEREBY GIVEN, the Division of Air Pollution Control will hold a public hearing pursuant to Tennessee Code Annotated, Section 68-201-105

Location: Davy Crockett Tower, 7th Floor Conference Room D, 500 James Robertson Parkway, Nashville, Tennessee

Date: March 26, 2025

Public Hearing: 10:00 AM Central Time

There will be a public hearing before the Technical Secretary of the Tennessee Air Pollution Control Board to consider a proposed State Implementation Plan (SIP) revision under the authority of Tennessee Code Annotated, Section 68-201-105. Tennessee is proposing a SIP revision to request the redesignation of the portion of Sullivan County encompassing a circle having its center at coordinates 36.5186 N; 82.5350 W (B-253 powerhouse, Eastman Chemical Company), and having a three-kilometer radius from nonattainment to attainment for the one-hour sulfur dioxide (SO_2) National Ambient Air Quality Standard (NAAQS).

Tennessee proposes to demonstrate in the SIP revision that the area has attained the SO_2 NAAQS based on permanent and enforceable emission reductions resulting from implementation of the applicable implementation plan and applicable Federal air pollutant control regulations and other permanent and enforceable reductions. Tennessee has also prepared an emissions inventory, which indicates declining SO_2 emissions and demonstrates that the region is likely to remain in attainment of the NAAQS in the future. The redesignation request includes contingency measures that may be put into place to correct NAAQS exceedances that could occur after redesignation of the area to attainment.

HEARING INFORMATION

The hearing will take place at the location, date, and time indicated above. All persons interested in the air quality of the State of Tennessee are urged to attend and will be afforded the opportunity to present testimony to the hearing officer regarding the draft general permit. Anyone desiring to make oral comments at this public hearing is requested to prepare a written copy of their comments to be submitted to the hearing officer at the public hearing. The hearing officer may limit the length of oral comments in order to allow all parties an opportunity to speak, and will require that all comments be relevant to the draft general permit.

Written statements not presented at the hearing will only be considered part of the record if received by close of business on **March 26, 2025**, at the office of the Technical Secretary, Tennessee Division of Air Pollution Control, 312 Rosa L. Parks Avenue, 15th Floor, William R. Snodgrass Tennessee Tower, Nashville, TN 37243. To assure that written comments are received and addressed in a timely manner, written comments must be submitted using one of the following methods:

1. **Mail, private carrier, or hand delivery:** Address written comments to Michelle Owenby, Division of Air Pollution Control, William R. Snodgrass Tennessee Tower, 312 Rosa L. Parks Avenue 15th Floor, Nashville, Tennessee 37243.

2. **E-mail**: Submit electronic comments to air.pollution.control@tn.gov.

A final determination will be made after weighing all relevant comments.

Individuals with disabilities who wish to participate in these proceedings (or review the file record) should contact TDEC to discuss any auxiliary aids or services needed to facilitate such participation. Contact may be in person, by writing, telephone, or other means, and should be made no less than ten working days prior to **March 26, 2025**, to allow time to provide such aid or services. Contact the ADA Coordinator (1-866-253-5827) for further information. Hearing impaired callers may use the Tennessee Relay Service (1-800-848-0298). If you have any questions about the draft general permit, you may contact Mr. Travis Blake by phone at (615) 306-1990 or by e-mail at travis.blake@tn.gov.

HEARING OPTIONS

This is a hybrid hearing. You may attend the hearing in person at the following location: **Davy Crockett Tower, 7th Floor Conference Room D, 500 James Robertson Parkway, Nashville, Tennessee**

Or you may attend online via Microsoft Teams (see log-in and call-in information below):

Subject: FW: Notification to APC Board - Sullivan County Redesignation

Good morning APC Board members,

There will be a public hearing before the Technical Secretary of the Tennessee Air Pollution Control Board to consider a proposed State Implementation Plan (SIP) revision under the authority of Tennessee Code Annotated, Section 68-201-105. Tennessee is proposing a SIP revision to request the redesignation of the portion of Sullivan County encompassing a circle having its center at coordinates 36.5186 N; 82.5350 W (B-253 powerhouse, Eastman Chemical Company), and having a three-kilometer radius from nonattainment to attainment for the one-hour sulfur dioxide (SO_2) National Ambient Air Quality Standard (NAAQS). Tennessee proposes to petition the U. S. EPA for redesignation of the Sullivan County one-hour sulfur dioxide nonattainment area to attainment based on an attaining three-year design value for the period 2020-2022 and upon air dispersion modeling that demonstrates future maintenance of the NAAQS.

A copy of the redesignation request is available for review at the following link: https://www.tn.gov/content/dam/tn/environment/air/documents/publicnotices/apc_ppo-sullivan-county-so2-redesignation.pdf. If you have any questions about this document, please contact Travis Blake at (615) 306-1990 or via e-mail at travis.blake@tn.gov.

Public Hearing
Proposed SO2 Redesignation
Division of Air Pollution Control

March 20, 2025

Introductions

- Moderator: Jan Compton, Regional Director
  Office of External Affairs - Johnson City
- Technical Staff: Travis Blake
  Division of Air Pollution Control
- Virtual Host: Christian Black
  Johnson City Environmental Field Office

Agenda

Environment & Conservation

Division of Air Pollution Control
Public Hearing Agenda
March 20, 2025

TN Division of Air Pollution Control (TDAPC) will hold a public hearing pursuant to Tennessee Code Annotated, Section 68-201-105.

Tennessee is proposing a SIP revision to request the redesignation of the portion of Sullivan County encompassing a circle having its center at coordinates 36.5186 N; 82.5350 W (B-253 powerhouse, Eastman Chemical Company), and having a three-kilometer radius from nonattainment to attainment for the one-hour sulfur dioxide (SO2) National Ambient Air Quality Standard (NAAQS).

Print your name and e-mail address on the Registration Sheet as you enter. If you wish to make comments, please place a checkmark (✓) in the "I Wish to Comment" column.

I. Welcome and Agenda
Jan Compton, Division of Stakeholder Engagement, Office of External Affairs

II. Informational Session, Travis Blake, Division of Air Pollution Control

III. Public Hearing Comments Received (On Site & Virtual)

III. Closing

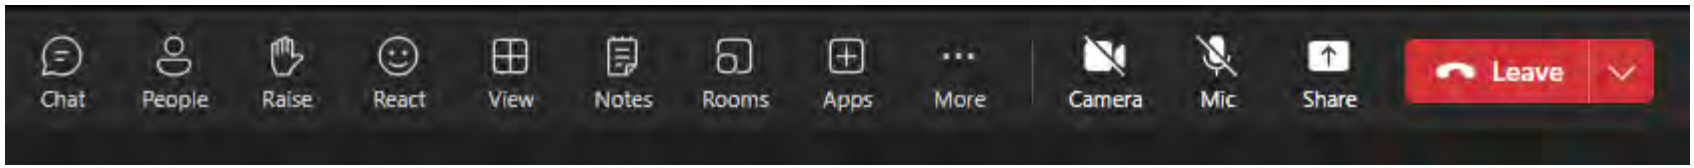
Note: If you signed up to comment, you will be called to the microphone and asked to state your name and present your comments related to this specific SIP revision. A written copy of your comments would be appreciated, if available. Questions will not be answered during the formal hearing but a Response to Comments will be issued with the final permit decision.

The meeting moderator may limit the length of oral comments in order to allow all parties an opportunity to speak.

Submitting a Comment: Written statements not presented at the hearing will only be considered part of the record if received by Close of Business March 20, 2025, via e-mail at air.pollution.control@tn.gov.

TDEC thanks you for your participation and attendance at today's hearing

Sign-in and MS Teams



- Information on how to join the online meeting is available at tn.gov/environment
  Public Participation on the main menu
  Air Notices and Hearings
  Links for the public meeting with today's date: 3/20/2025

- You may also call into the meeting by dialing 629-209-4396
  Conference ID: 588 659 248#
  Callers can mute and un-mute by dialing *6

- For technical difficulties, call 423-823-8077
  (This number is for Christian Black, our virtual host)

Q&A

- Information Session: Presentation and Q & A
- During this time, staff can respond to questions
- In-person participants will visit with staff at information stations throughout the room
- Virtual participants: Use the raise hand icon or enter your name or question in the chat box.
- If you have called in to the meeting, you may un-mute your device by dialing *6 when we recognize callers' time for questions.

Department of Environment & Conservation

STATE OF TENNESSEE

Redesignation Request for the Sullivan County SO_2 Nonattainment Area

March 20, 2025

Background

- The Kingsport SO_2 nonattainment area includes the portion of Sullivan County encompassing a 3-km circle centered at Eastman Chemical Company's B-253 powerhouse.

- Between 2008 and 2010, air quality monitoring indicated that ambient SO_2 concentrations in the area exceeded the 75 ppb one-hour SO_2 National Ambient Air Quality Standard (NAAQS), and EPA designated the area as nonattainment for the SO_2 NAAQS, on October 4, 2013.

- Tennessee submitted attainment demonstrations in 2017 and 2023 and projected that the area would attain the NAAQS based on SO_2 reductions achieved by repowering of one Eastman powerhouse from coal to natural gas and from the installation of dry sorbent injection (DSI) controls on Eastman's largest remaining uncontrolled boilers.

Sullivan County Nonattainment Area

Overview of Redesignation Request

- Tennessee is petitioning EPA for redesignation of the Sullivan County nonattainment area to attainment for SO_2 NAAQS, based on an attaining design value for 2020-2022 (three-year design value less than 75 ppb) at each monitor in the nonattainment area.

- This petition demonstrates that area has attained the NAAQS and that the observed reduction in SO_2 levels is due to permanent and enforceable emission reductions.

Eastman Source-Specific Limits

Source Description	SO_2 Emission Limit
B-83 and B-325 Coal-Fired Boilers	1,248 lb/hr (combined limit for all boilers, 30-day rolling average)
B-253 Boilers	Only natural gas may be used as fuel
B-325 Boiler 30	317 lb/hr (30-day rolling average)
B-325 Boiler 31	293 lb/hr (30-day rolling average)
Coal Gasification Tail Gas Incinerator	21.8 lb/hr (24-hour block average)
Coal Gasification Cold and Warm Flares	16.28 lb/hr (30-day rolling average) and 48 tons during any period of 12 consecutive months
B-55 Organic Acids & Anhydrides Manufacturing	6.74 lb/hr
B-248 Solid/Liquid Chemical Waste Incinerators	15.2 lb/hr (combined limit for both rotary kilns, 30-day rolling average)
B-248 Liquid Chemical Waste Incinerator	2.0 lb/hr (30-day rolling average)

Primester Source-Specific Limit

- The redesignation request establishes a source-specific limit of 0.25 lb/hr (three-hour rolling average) for Primester's Organic Acids & Anhydrides Process Unit (similar to Eastman B-55 process unit).

EPA Review and Public Participation

- A prehearing draft of the redesignation request was made available to the public and submitted to U. S. EPA on February 11, 2025.

- Formal public participation includes a 30-day public comment period, in which members of the public and EPA may submit formal comments.

- A final redesignation request will be submitted to the Tennessee Air Pollution Control Board for approval once the comment period has closed and all comments have been addressed.

THANK YOU

Department of Environment & Conservation

Public Hearing
Proposed SO2 Redesignation

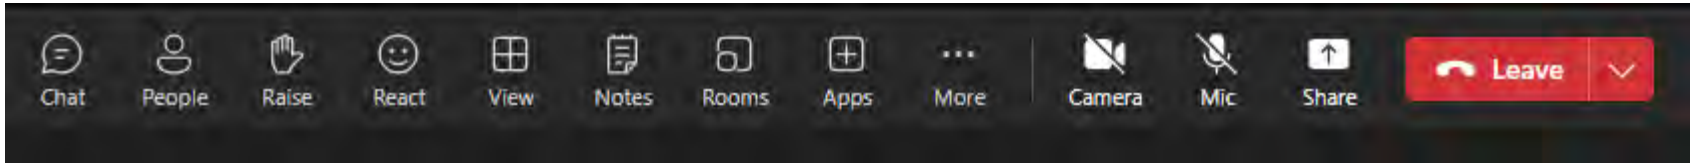
Division of Air Pollution Control

March 20, 2025

Introductions

- Moderator: Jan Compton, Regional Director
  Office of External Affairs - Johnson City
- Technical Staff: Travis Blake
  Division of Air Pollution Control
- Virtual Host: Christian Black
  Johnson City Environmental Field Office

Sign-in and MS Teams



- Information on how to join the online meeting is available at tn.gov/environment
  Public Participation on the main menu
  Air Notices and Hearings
  Links for the public meeting with today's date: 3/20/2025

- You may also call into the meeting by dialing 629-209-4396
  Conference ID: 588 659 248#
  Callers can mute and un-mute by dialing *6

- For technical difficulties, call 423-823-8077
  (This number is for Christian Black, our virtual host)

Procedural Overview

- If you do not wish to comment but you do want to be notified of the response to comments, send a written request for this to one of the addresses below for submitting written comments.
  - Written comments may be submitted until **March 20, 2025.**
  - Email written comments to air.pollution.control@tn.gov
  - Mail written comments to Tennessee Department of Environment & Conservation, Division of Air Pollution Control,500 James Robertson Pkwy, 7th Floor, Nashville, TN 37243
- To ensure everyone wanting to comment has a chance to do so this afternoon, each speaker will be limited to **5 minutes**.
- Public comments and questions will be addressed through the Department's Response to Comments.

Comments?

- Before sharing comments, please clearly state your name, affiliation, and, if you are a virtual participant or have called into the hearing, your physical location.
- Please limit your oral comments to 5 **minutes**.
- In-person comments first, then virtual hands raised or names typed into the chatbox. Phone-in users will also have an opportunity to comment.

Additional Comments?

- If you have written comments which you wish to have entered into the hearing record by **March 20, 2025** submit them by email to air.pollution.control@tn.gov or mail to:

  TN Department of Environment & Conservation
  Division of Air Pollution Control
  Davy Crockett Tower, 7th Floor
  500 James Robertson Parkway, 9th Floor
  Nashville, TN 37243

- These instructions are also available in the public notice and agenda.

Thank you!

TDEC thanks you for your participation and attendance at today's hearing.

Public Hearing Transcript

Transcript of Public Hearing
March 20, 2025

The following text is an AI-generated transcript, as reviewed and corrected by Travis Blake. A copy of the audio file is available upon request.

Christian Black: started transcription

Jan Compton: "Good afternoon, everyone. Welcome. Welcome to the Tennessee Department of Environment Conservation's Air Pollution Control Public hearing. We are... We have received information session and a presentation by Travis that was very informative, and this this afternoon's recording will be... our hearing will be recorded on Microsoft Teams. The technical staff will not be answering questions during this portion of the meeting. Public comments and questions will be addressed to the Department's response to comments and all public comments will be considered. As we go into this, we'll let you know, my name is Jan Compton, I'm with the Tennessee Department of Environment and Conservation's division of stakeholder engagement, also in the Office of External Affairs, and I have several staff today, co-workers with the department that are joining me with the technical staff. First, we have Travis Blake, who is working on the project for this SIP potential change. We have Michelle Oaks with us from Nashville as well., thank you for joining us in person, and online, we have a number of staff as well. We have Chelsea meadows, who is out of Nashville, we have our air pollution control manager, Amanda Davis. And then we also have Matt Hayes, who is with the division of Air Pollution Control out of the Johnson City office. I have a couple of admin staff from Johnson City helping me in person, Debbie England, and online, Christian Black and I appreciate you so much. We are hosting this meeting online, there are folks online that Christian is taking care of, and in person we have guests here. So we are able to offer this and let many people participate by offering this online portion."

"Okay, so just to give you a little bit of a history about what we're doing, there is... There is a public hearing before the Technical Secretary of the Tennessee Air Pollution Control Board to consider a proposed State Implementation plan or a SIP, which it's often called, a revision under the authority of Tennessee Code Annotated section 68-201-105 Tennessee is proposing a SIP revision to request the recent redesignation of the portion of Sullivan County, which we are in tonight, encompassing a circle having its center at coordinates 36.5186 N 82.535 to the West, B-253 powerhouse Eastman Chemical Company and having a three kilometer radius, from nonattainment to attainment for the one hour sulfur dioxide, or SO_2, national ambient air quality standard. So Tennessee proposes to petition the U. S. EPA for redesignation of the Sullivan County, one-hour sulfur dioxide nonattainment area to attainment based on the attaining three-year design value for the period 2020 through 2022 and upon air dispersion modeling that demonstrates future maintenance of the ambient air quality standards. Tennessee proposes to demonstrate in the SIP revision that the area has attained the SO_2 national ambient air quality standard based on permanent and enforceable emission reductions resulting from implementation of the applicable implementation plan and federal air pollution control regulations, as well as other permanent and enforceable reductions. Tennessee has also prepared an emissions inventory, which indicates declining SO2 emissions and demonstrates that the region is likely to remain entertainment of the National Ambient Air Quality Standard in the future. The redesignation request includes contingency measures that may be put into place to correct National Ambient Air Quality Standards exceedances that could occur after redesignation of the area to attainment. So a copy of the redesignation request is available online, as Travis mentioned earlier,

if you need a copy of that, please see me and I'm happy to do that or request that in the chat, and we're happy to give that to you. So thankfully we have these staff attending today who will, who have helped us with this presentation. We are going to get into the public comments now."

"I think everybody already has the codes on how to get into Microsoft Teams, how to ask questions if you have them and how to submit official public comments. So, I will start tonight with the comment methodology: how do we do this? So, the overview is that if you don't wish to comment but you want to be notified of the response to comments, then you can send a written request for this to be to one of the addresses below for submitting written comments. So written comments are submitted by March 20th, 2025. e-mail written comments to air dot pollution dot control at TN dot gov, and you can mail written comments to the Tennessee Department of Environment and Conservation, Division of Air Pollution Control 500 James Robertson Parkway on the 7th floor of Nashville, TN 37243 so to ensure everyone wanting to comment has a chance to do so, we always ask our folks to be limited to 5 minutes, but tonight if you have a comment, you're welcome to take a little more time. So public comments and questions will be addressed through the department's response to comments. Again, technical staff can't answer questions, during this public hearing. So next we'll move into comments: is there anyone in person that would like to give a comment? Steve, I think you said no? OK, we have no one in person wishing to do comments. Trish or Christian, do you have folks there that would like to comment or is there anybody other than TDEC on there?"

Christian Black: "No, we have nobody here who wants to comment."

Jan Compton: "Okay. No one on the phone either. Okay. So, if there's no one online or in person who wants to make official comments at this time, we will declare this an official public hearing which gave the public a chance to participate in person, online, or even by calling in. So, if you have any written comments that you haven't entered already and you want to have them entered again, you need to do that by March 20th 2025, which is like today. So, you would, again, and send this to air.pollution.tn.gov. You can mail them to Travis, or you can mail them to the Tennessee Department of Environment Conservation's Air Pollution Control if you're doing the US Postal Service, where the Davy Crockett Tower on the 7th floor, 500 James Robertson Parkway... I'm sorry, you're the ninth floor, right?

Michelle Oakes: "Seventh floor."

Jan Compton: "Sorry, I actually just did one for water too. I thought it was on the ninth... so we're going to send them to the 7th floor, thank you. And these instructions are also available in the public notice and the agenda which alerted you to the meeting tonight, so there's plenty of ways to participate in this public participation opportunity. So again, I'm Jan Compton. I'm happy to serve for the facilitator today and TDEC thanks you for your participation and attendance at today's hearing. The public participation process is very important to us, and we thank you. Christian, you can stop recording."

Christian Black: Stopped transcription.

Travis,

As we discussed yesterday, preliminary screening data for SO_2 emissions from the Acid Con Sludge Recovery Process (Source Number 224 in Permit 082237) shows that additional control of SO_2 emissions from the batch reactors and/or sludge handling belt may be required to meet the emissions limitation specified in S4-1 of Permit 082237 under maximum operating conditions.

Eastman is currently preparing a construction permit application to authorize the installation of a new, fiberglass caustic scrubber to achieve safe, reliable, and effective reduction of SO_2 emissions from this process. The application will also include a temporary mitigating action to add a caustic supply to the existing scrubber on the batch reactors (largest source of SO_2 emissions from this process). Process modeling/simulation predicts that this addition will be at most 40% effective at reducing SO_2 in the vent stream from the batch reactors. However, this temporary system could serve as a "bridge" to the more robust emissions control system, i.e., new, permanent caustic scrubber. This is a similar approach that was taken with B-83 Powerhouse on Boilers 23 and 24 where a temporary DSI (Dry Sorbent Injection) system was operated in the interim period while a permanent system was designed and installed.

Initial responses from vendors indicate that a fiberglass scrubber could take 6 to 9 months for delivery. Consequently, Eastman would like to request that TDEC include additional time in Permit 082237, Section S4-1 after permit issuance for this emissions control project to be executed. As stated previously, this is contingent on the emissions testing being conducted on this process in April and May indicating that additional emission controls are required to meet the hourly emissions limitation. Eastman would provide TDEC with routine updates, at TDEC's discretion on frequency, as to the status of the project until the project is completed, or such time that Eastman determines, based on required emissions testing results, that the project is not needed for compliance.

Thank you for your time and consideration in this matter.

Attachment M2
Comments Received from U. S. EPA

The U.S. Environmental Protection Agency Preliminary Comments on the Tennessee Department of Environment and Conservation (TDEC), Division of Air Pollution Control's Prehearing Submission Regarding the Redesignation Request and Maintenance plan for the Sullivan County Sulfur Dioxide (SO_2) Area

The comments provided herein are based on historical policy interpretation respecting the redesignation and maintenance plan criteria for the 2010, SO_2 national ambient air quality standards (NAAQS) prior to the Agency's January 21, 2025, transition. As such any policy considerations supporting these comments will need further vetting and are subject to change.

1. **The EPA offers the following comments respecting Clean Air Action (CAA) § 107(d)3(E)i redesignation criteria that the Sullivan County Area has attained the 2010 1-hour sulfur dioxide (SO_2) national ambient air quality standard:**

   A. Air Quality Monitoring
   - To ensure TDEC's redesignation is based on the most current air quality monitoring data, the EPA recommends TDEC include the complete and certified 2023 SO_2 monitoring data and the preliminary 2024 monitoring data as part of the final redesignation/maintenance state implementation plan (SIP) submission. If the final SIP package is submitted after May 1, 2025, the EPA recommends TDEC include the final, certified 2024 monitoring data.

   B. Air Dispersion Modeling
   - ***Table 2-6: Other Modeled SO_2 Emission Sources:*** For several of the Emissions Sources, the "Modeled SO_2 Emission Rate grams per second (g/s)" provided in the 5th column of the table is different than the emissions rates included in the actual AERMOD modeling files available to EPA at the time of review (Runs 2023-0120) that were provided for review. The following table summarizes the sources where there are differences between the values listed in Table 2-6 and what is included in the modeling files:

Unit ID	Description	Table 2-6 Emission Rate (g/s)	AERMOD Modeling Files Emission Rate (g/s)	Difference (g/s)
B265B1A	NG-Fired Heat Transfer Furnace	3.63E-04	2.88E-04	0.75
B265B1C	NG-Fired Heat Transfer Furnace	4.60E-04	5.75E-04	-1.15
B256_5	HTM Furnace 5	1.00E-02	1.68E-03	8.32E-03
B256_5	HTM Furnace	1.00E-02	1.68E-03	8.32E-03

DRAFT

	5			
B256_6	HTM Furnace 6	1.00E-02	1.68E-03	8.32E-03
B256_7	HTM Furnace 7	1.00E-02	1.68E-03	8.32E-03
B256_8	HTM Furnace 8	1.00E-02	1.68E-03	8.32E-03
B256_9	HTM Furnace 9	1.00E-02	1.68E-03	8.32E-03
B256_10	HTM Furnace 10	1.00E-02	1.68E-03	8.32E-03
B55_1B	Organic Acids & Anhydrides Manufacturing	0.756	0.672	0.084

The EPA recommends that the AERMOD Modeling runs be revised to ensure that all the emissions limits that listed in Table 2-6 correspond to the emissions rates included in the actual modeling runs. Alternatively, if a separate modeling run corresponds to the numbers in the table, the EPA requests the updated inputs for review as soon as practicable.

- **Attachment H1b, TDEC-APC Modeling Analysis for the Sullivan County, TN SO_2 Nonattainment Area, Section 4.0 SO_2 Ambient Background Concentrations:** The information contained in the spreadsheets included with the AERMOD modeling files does not provide all the information needed to reproduce the calculation of the Season-by-Hour of Day Background Concentrations presented in Table H9-4. Please consider providing the raw hourly ambient concentration data for 2019-2021 from the Mammoth Cave National Park Monitor in Kentucky (AQS ID 21-061-0501). The EPA also recommends that all the steps in the calculations be included in the spreadsheets to allow verification of the calculations. Note that the EPA's March 1, 2011, Guidance provides more information on the procedures that the EPA is using for this evaluation.

- The redesignation and maintenance plan criteria at CAA §107(d)3 and 175A of the CAA are standalone submissions separate from the CAA §172(c) attainment SIP requirements for nonattainment areas. The EPA recommends TDEC review the final redesignation submission to remove all references to the air agency's February 2023 attainment SIP from the final redesignation submission except for SIP narrative at section 2.0 that addressed the state's compliance with 110 and part D SIP redesignation requirements of §107(d)3(E)v of the CAA.

- The EPA suggests TDEC revise the statement in section 2.2 – Air Quality modeling to read as follows: *The second component of Tennessee's analysis relies upon air quality modeling* ***of SO_2 emitting sources in the Area including enforceable control measures*** *to demonstrate that the area has attained the NAAQS pursuant to CAA §107(d).*

DRAFT

2. **CAA §107(d)3(E)iii - The EPA has determined that the improvement in air quality is due to permanent and enforceable reductions in emissions.**

   A. Enforceable control measures proposed for adoption into the Tennessee SIP

   - The EPA recommends TDEC include in Table 4-4 the requirement to operate the dry sorbent injection (DSI) controls for B-83 boilers 23 and 24 from Permit #082237, condition S1-2 as one of the enforceable measures proposed for adoption into the Tennessee SIP.

   - Footnote #34 states "SIP permit 082237, which is included with this redesignation request, incorporates the emission limits and monitoring requirements of permit 080222 for most sources and adds periodic reporting requirements." This includes the B-83 and B-325 combined SO_2 emission limit of 1,248 lb/hr 30-day rolling average that Tennessee requested the EPA adopt into the SIP through the February 2023 attainment SIP to address regional haze obligations. The EPA recommends TDEC consider the interaction with the state's regional haze obligations and the Eastman combined limits for Boiler house 83 and 325.

   - The EPA suggests air agency's redesignation request include quantitative information about emission reductions achieved by relevant measures to demonstrate that the improvement in air quality is attributed to permanent and enforceable measures. Where possible, the EPA recommends TDEC quantify the SO_2 emission reductions (or percent in reductions) in tons from the control measures listed Table 4-4.

   B. Sources modeled at the maximum uncontrolled hourly SO_2 emission rate.

   The EPA appreciates the permit application documentation TDEC provided in Attachment K of the redesignation request and maintenance plan prehearing. As a follow-up to previous discussions, the EPA recommends TDEC draft a brief narrative for each relevant emission unit that supports the State's assertion that the modeled SO_2 emission limits for certain sources represent the maximum uncontrolled hourly emission limit (i.e. unrestricted by permit conditions requiring the operation of control devices, limits on heat input or raw material input, or other restrictions).

   The EPA supports TDEC's draft summary for MSOP-02, Boilers 32, 33, and capacities (including the potential to increase emission rate through changes in design capacity or burning alternative fuels) and recommends the state utilize this narrative format for all other modeled emission sources. Additionally, the EPA suggests TDEC's summaries identify the applications listed in

DRAFT

Attachment K (i.e., cite to the relevant permit application citation listed in Attachment K including the application date, the corresponding permit number associated with the application and page number where this specific information can be found).

Lastly, it would be helpful if the summaries clarified whether any of the fuel usage restrictions are in addition to the inherent restrictions on these emission units due to their size and design.

The EPA suggests further discussion on whether to include a summary of the modeled impacts for each emission unit as the EPA has not established a threshold for modeled contribution impacts.

C. **Coal Gasification Cold and Warm Flare:** The revised SO_2 emissions permit limit for the PES B-351-5, Coal Gasification Cold and Warm Flares (82-0003-171, MSOP-17) does not ensure that the flare emissions will not contribute to a violation of the 1-hour SO_2 NAAQS. The revised permit limit of 16.28 lb/hr, 30 calendar day rolling average is identical to the 1-hour Critical Emission Value (CEV) that was included in the air modeling demonstration showing attainment of the NAAQS.

As discussed in Section V.D.2. and Appendix B of EPA's April 23, 2014 "Guidance for 1-Hour SO_2 Nonattainment Area SIP Submissions," longer term average limits (e.g., 30-day rolling average) may be justifiable, so long as they are of at least comparable stringency to a 1-hour limit at the CEV. When setting a longer-term average limit such as the 30-day rolling average limit for the flares, EPA expects that a downward adjustment of the numerical limit would be needed from the 1-hour CEV to compensate for the loss of stringency inherent in applying the longer-term average limit versus a 1-hour limit. Therefore, EPA recommends that TDEC revise the 30-day rolling average limit to provide for a comparably stringent limit to a 1-hour limit established at the CEV to ensure no violations of the NAAQS will reasonably be expected to occur. This may require operational changes to the coal gasification process or installation of additional control equipment to reduce the magnitude and frequency of emissions from the flare unit. The EPA is available to discuss this issue further upon request.

D. **Parametric monitoring**: The EPA is available for further discussions on the enforceable parameters to ensure practical enforceability for the B-248 and Primester monitoring parameters.

3. CAA 107(d)3(E)iv - The EPA has fully approved a maintenance plan, including a contingency plan, for the area under section 175A of the Act.

A. **2022 Emission and Attainment Inventory:** The EPA offers the following comments on the development of the 2022 emission inventory:

DRAFT

- Please include a table summarizing total SO_2 emissions for each data source category.
- The prehearing submission includes a link to the EPA's 2016v1 and 2016v2 inventory, but no emission file names were included. Please provide the name of the EPA's emission modeling files used to calculate the area source emissions.
- For footnote 44, please explain why the emission value are different from the emissions reported to the emission inventory system (EIS) for the 2017 Eastman Facility wide emissions.
- Please explain why the 2022 emissions in Table 5-1 are different from Attachment A and the emissions reported to EIS for the 2017/2022 Eastman Facility wide emissions.
- Table 5-3 has a typo for 2037 emissions. Based on the Attachment, it should be 7,337 tons per year.
- In Table A-1, Footnote 2, TDEC mentions that the 2022 national emission inventory (NEI) value for Eastman emission unit, B-334-1 is incorrect in the EIS. EPA recommends TDEC submit an update to the 2022 NEI to correct the emissions data for emission unit B-334-1.

B. Maintenance demonstration
    - The redesignation request and maintenance plan are standalone SIP submissions. The EPA recommends TN remove the following attainment SIP reference in section 6.0 – Maintenance plan: *Tennessee submitted a modeled attainment demonstration on February 9, 2023, which demonstrated that the area would attain the NAAQS at the maximum allowable emission rate (or, for some small sources, the maximum uncontrolled hourly emission rate), for all modeled emission sources*. This statement suggests where a state has submitted an attainment plan, the plan in some cases serve as a maintenance plan for the area. However, this statement refers to an attainment SIP approved by the EPA. It also indicates in certain cases that the attainment SIP modeling reflects all enforceable measures needed to attain the standard and demonstrate maintenance.

- Any future growth, operational changes and/or emission reductions measures accounted for in the projected inventory should be reflected in the air model analysis to show attainment of the 1-hour standard and demonstrate maintenance through 2037. The prehearing modeling files appears to exclude the plastics processing plant. It is unclear what future growth and emission reduction measures support the modeled maintenance demonstration. Alternatively, if a separate modeling run includes this information, the EPA requests the updated inputs for review as soon as practicable.

  Considering TDEC's maintenance demonstration is based on air dispersion modeling analysis rather than a comparison of attainment and

DRAFT

projected actual emissions, the EPA recommends the final redesignation and maintenance demonstration rely on one modeling analysis that reflects existing enforceable control measures and the future growth and operational changes to ensure compliance with the redesignation and maintenance criteria at section 107(d)3(E)(i), (E)(iii) and E(iv) (i.e., demonstrates the area has attained the SO_2 standard based on permanent and enforceable emission reduction/control measures and maintenance through 2037.

- The EPA recommends TDEC explain the purpose or benefit of relying on projected allowable emissions rather than projected actuals.

- Section 5.0: The EPA recommends TDEC replace the phrase "nonattainment area's control strategy" with "demonstrating maintenance with the 2010 SO_2 NAAQS**."**

- The EPA recommends TDEC revise the following statement in section 6.0: *As discussed in Section 4.0, attainment of the NAAQS is based on ~~permanent and~~ enforceable emission reductions implemented for Eastman Chemical Company's coal-fired boilers,* ***and other SO_2 emitting sources at the facility*** *~~as well as other federally enforceable emission limits~~* ***and made permanent in the Tennessee SIP*** *~~as to ensure that other existing sources will not cause or contribute to nonattainment.~~*

C. Monitoring network:
   - The EPA recommends TDEC revise the following statement: *Should Tennessee petition to discontinue the operation of any monitor* in the area, *the Tennessee Department of Environment and Conservation's…"*

   - Should a request from TDEC to discontinue any monitor in the Area be approved, the EPA recommend the State commit to revise the maintenance plan accordingly to reflect future changes to the Area's monitoring network.

D. Verification of continued attainment
   - The EPA suggests the maintenance plan show how the air agency will track maintenance progress in the Area regardless of how the maintenance demonstration is determined. The EPA recommends TDEC revise the following statement to read: Tennessee will track the ~~*Tracking of progress*~~ continued attainment and ~~*of the*~~ *maintenance* progress ~~*plan is not required because all of the*~~ through air quality monitoring pursuant to 40 CFR part 58 and enforcement of the SIP and control measures ~~*proposed control measures have been installed and are operating. Tennessee will track continued attainment and maintenance of the NAAQS through air quality monitoring*~~

DRAFT

E. Contingency measures:

- The contingency measures for an attainment SIP (pursuant to section 172(c) of the Act) are established to address when an area does not meet reasonable further progress towards attainment or attain the NAAQS by the statutory attainment date. Contingency measures for a maintenance plan are established to address a NAAQS exceedance or violation after an Area has been legally redesignated to attainment. For these reasons, the EPA recommends TDEC remove the calendar years 2024 thru 2027 and 2028 as part of the maintenance plan triggered event.

- The EPA recommends TDEC clarify when the air agency intends to notify the EPA of a triggered event.

- The EPA recommend the contingency measures system audit consider sources outside the Area.

- The EPA recommends TDEC remove all references to the 2023 attainment SIP.

- The EPA suggests TDEC apply the contingency measures comments for the maintenance plan to the draft contingency measure in operating permit #082337, condition G4.

DRAFT

Attachment M3
Response to Comments

Response to Comments

I. EPA Comments

The following comments were received from U. S. EPA's Region 4 Office on March 14, 2025.

Comment #1A: *To ensure TDEC's redesignation is based on the most current air quality monitoring data, the EPA recommends TDEC include the complete and certified 2023 SO_2 monitoring data and the preliminary 2024 monitoring data as part of the final redesignation/maintenance state implementation plan (SIP) submission. If the final SIP package is submitted after May 1, 2025, the EPA recommends TDEC include the final, certified 2024 monitoring data.*

Response: Tennessee updated Tables 2-2 and 2-3 to add 2024 final data.

Comment #1B (Part 1): Table 2-6: Other Modeled SO_2 Emission Sources: *For several of the Emissions Sources, the "Modeled SO_2 Emission Rate grams per second (g/s)" provided in the 5th column of the table is different than the emissions rates included in the actual AERMOD modeling files available to EPA at the time of review (Runs 2023-0120) that were provided for review. The following table summarizes the sources where there are differences between the values listed in Table 2-6 and what is included in the modeling files:*

Unit ID	***Description***	***Table 2-6 Emission Rate (g/s)***	***AERMOD Modeling Files Emission Rate (g/s)***	***Difference (g/s)***
B265B1A	*NG-Fired Heat Transfer Furnace*	*3.63E-04*	*2.88E-04*	*0.75*
B265B1C	*NG-Fired Heat Transfer Furnace*	*4.60E-04*	*5.75E-04*	*-1.15*
B256_5	*HTM Furnace 5*	*1.00E-02*	*1.68E-03*	*8.32E-03*
B256_6	*HTM Furnace 6*	*1.00E-02*	*1.68E-03*	*8.32E-03*
B256_7	*HTM Furnace 7*	*1.00E-02*	*1.68E-03*	*8.32E-03*
B256_8	*HTM Furnace 8*	*1.00E-02*	*1.68E-03*	*8.32E-03*
B256_9	*HTM Furnace 9*	*1.00E-02*	*1.68E-03*	*8.32E-03*
B256_10	*HTM Furnace 10*	*1.00E-02*	*1.68E-03*	*8.32E-03*
B55_1B	*Organic Acids & Anhydrides Manufacturing*	*0.756*	*0.672*	*0.084*

The EPA recommends that the AERMOD Modeling runs be revised to ensure that all the emissions limits that listed in Table 2-6 correspond to the emissions rates included in the actual modeling runs. Alternatively, if a separate modeling run corresponds to the numbers in the table, the EPA requests the updated inputs for review as soon as practicable.

Response: Table 2-6 was updated/corrected as indicated below:

- **MSOP-31, PES B-265B-1 (Model Tags B265B1A and B265B1C):** Table 2-7 was updated to match the modeled emission rates. Tennessee did find an error in the model inputs, because one furnace was

modeled at slightly above the maximum uncontrolled hourly emission rate, while the second furnace was modeled at slightly lower than the maximum uncontrolled hourly emission rate. Tennessee believes that it is not necessary to update the model because the two furnace stacks are co-located and because the combined modeled emission rate (total for both furnaces) is higher than the combined maximum hourly emission rate for both furnaces.

Source	Modeled Emission Rate (g/s)	Max. Uncontrolled Hourly Emission Rate (g/s)
SM-01 Furnace	2.88×10^{-4}	3.63×10^{-4}
SM-02 Furnace	5.75×10^{-4}	4.60×10^{-4}
Total	**8.63×10^{-4}**	**8.23×10^{-4}**

- **MSOP-11 HTM furnaces (Model Tags B256_5, B256_6, B256_7, B256_8, B256_9, and B256_10):** Tennessee corrected the modeled emission rate of each furnace in Table 2-6 from 1.00×10^{-2} g/s to 1.68×10^{-3} g/s. The modeled emission rate for each furnace is greater than its maximum uncontrolled hourly emission rate at the design heat input (1.48×10^{-3} g/s).

- **MSOP-23 PES B-55-1, Vent B (Model Tag B55_1B):** The Vent B modeled emission rate was corrected in Table 2-6 from 0.756 g/s to 0.672 g/s, which corresponds to the uncontrolled emission rate of 5.33 lb/hr for this vent. Modeled emissions from all vents in PES B-55-1 correspond to the emission rate that Tennessee has requested for adoption into the SIP (6.74 lb/hr).

Comment #1B (Part 2): Attachment H1b, TDEC-APC Modeling Analysis for the Sullivan County, TN SO_2 Nonattainment Area, Section 4.0 SO_2 Ambient Background Concentrations: *The information contained in the spreadsheets included with the AERMOD modeling files does not provide all the information needed to reproduce the calculation of the Season-by-Hour of Day Background Concentrations presented in Table H9-4. Please consider providing the raw hourly ambient concentration data for 2019-2021 from the Mammoth Cave National Park Monitor in Kentucky (AQS ID 21-061-0501). The EPA also recommends that all the steps in the calculations be included in the spreadsheets to allow verification of the calculations. Note that the EPA's March 1, 2011, Guidance provides more information on the procedures that the EPA is using for this evaluation.*

Response: See new Attachments I3 through I8.

Comment #1B (Part 3): *The redesignation and maintenance plan criteria at CAA §107(d)3 and 175A of the CAA are standalone submissions separate from the CAA §172(c) attainment SIP requirements for nonattainment areas. The EPA recommends TDEC review the final redesignation submission to remove all references to the air agency's February 2023 attainment SIP from the final redesignation submission except for SIP narrative at section 2.0 that addressed the state's compliance with 110 and part D SIP redesignation requirements of §107(d)3(E)v of the CAA.*

Response: Tennessee deleted the references to the attainment demonstration except for Section 3.0 (the reference to "section 2.0" was an error in EPA's comment, which was confirmed by a follow-up call to EPA).

Comment #1B (Part 4): *The EPA suggests TDEC revise the statement in section 2.2 – Air Quality modeling to read as follows: "The second component of Tennessee's analysis relies upon air quality modeling* ***of SO_2 emitting sources in the Area including enforceable control measures*** *to demonstrate that the area has attained the NAAQS pursuant to CAA §107(d)."*

Response: Tennessee added the requested statement with minor edits.

EPA Comment #2A (Part 1): *The EPA recommends TDEC include in Table 4-4 the requirement to operate the dry sorbent injection (DSI) controls for B-83 boilers 23 and 24 from Permit #082237, condition S1-2 as one of the enforceable measures proposed for adoption into the Tennessee SIP.*

Response: Tennessee added a requirement to operate the DSI controls as one of the enforceable measures listed in Table 4-4.

EPA Comment #2A (Part 2): *Footnote #34 states "SIP permit 082237, which is included with this redesignation request, incorporates the emission limits and monitoring requirements of permit 080222 for most sources and adds periodic reporting requirements." This includes the B-83 and B-325 combined SO_2 emission limit of 1,248 lb/hr 30-day rolling average that Tennessee requested the EPA adopt into the SIP through the February 2023 attainment SIP to address regional haze obligations. The EPA recommends TDEC consider the interaction with the state's regional haze obligations and the Eastman combined limits for Boiler house 83 and 325.*

Response: Tennessee updated SIP permit 082237 to remove condition G1, which stated, "This [sic.] emission limits and other requirements established by this permit supersede the limits previously established in SIP permit 080222." Because Tennessee's Regional Haze SIP includes permit 080222, we agree that it is not appropriate to supersede the older permit with respect to Eastman's coal-fired boilers (permits 080222 and 082237 include the same requirements for the boilers). Because the emission limits were changed for Eastman's cold and warm flares (MSOP-17, PES B-351-5), Tennessee added condition S3-3, which establishes that permit 082237 supersedes permit 080222 for that emission source only.

EPA Comment #2A (Part 3): *The EPA suggests air agency's redesignation request include quantitative information about emission reductions achieved by relevant measures to demonstrate that the improvement in air quality is attributed to permanent and enforceable measures. Where possible, the EPA recommends TDEC quantify the SO_2 emission reductions (or percent in reductions) in tons from the control measures listed Table 4-4.*

Response: Tennessee updated Section 4.3 of the narrative to quantify the SO2 reductions associated with the measures in Table 4-4:

- B-253 boiler emissions decreased from 14,897 tons/year in 2011 (all boilers burning coal) to 4,779 tons/year in 2017 (includes both coal and gas boilers) and 7.37 tons/year in 2022 (all boilers converted to gas operation).

- B-83 Boiler decreased from 5,686 tons/year in 2011 to 4,447 tons/year in 2017 and 2,227 tons/year in 2022.

- SO_2 emissions from the solid/liquid chemical waste incinerators (PES B-248-1) decreased from 6.5 tons/year in 2011 and 11.7 tons/year in 2017 to 3.44 tons/year in 2022.

- SO_2 emissions from the liquid chemical waste incinerator (PES B-248-2) decreased from 0.8 tons/year in 2011 and 2.96 tons/year in 2017 to 0.46 tons/year in 2022. The decreased in emissions from Eastman's incinerators were primarily the result of the sale of Eastman's adhesive resins business (the source of sulfur-containing waste in the incinerator feed) in 2022, and the emissions limits will ensure that SO_2 emissions from the incinerators do not interfere with the attainment or maintenance of the

SO_2 NAAQS in the future.

EPA Comment #2B: *The EPA appreciates the permit application documentation TDEC provided in Attachment K of the redesignation request and maintenance plan prehearing. As a follow-up to previous discussions, the EPA recommends TDEC draft a brief narrative for each relevant emission unit that supports the State's assertion that the modeled SO_2 emission limits for certain sources represent the maximum uncontrolled hourly emission limit (i.e. unrestricted by permit conditions requiring the operation of control devices, limits on heat input or raw material input, or other restrictions).*

The EPA supports TDEC's draft summary for MSOP-02, Boilers 32, 33, and capacities (including the potential to increase emission rate through changes in design capacity or burning alternative fuels) and recommends the state utilize this narrative format for all other modeled emission sources. Additionally, the EPA suggests TDEC's summaries identify the applications listed in Attachment K (i.e., cite to the relevant permit application citation listed in Attachment K including the application date, the corresponding permit number associated with the application and page number where this specific information can be found).

Lastly, it would be helpful if the summaries clarified whether any of the fuel usage restrictions are in addition to the inherent restrictions on these emission units due to their size and design.

The EPA suggests further discussion on whether to include a summary of the modeled impacts for each emission unit as the EPA has not established a threshold for modeled contribution impacts.

Response: Attachment K was revised to provide additional documentation of maximum uncontrolled hourly emission rates, and Tennessee incorporated EPA's comments into the documentation. Tennessee elected to retain the summary of modeled impacts for each source. The modeled impacts provide additional weight of evidence in favor of exclusion of small SO_2 sources from the SIP, but the final decision is based on multiple factors, including emissions, modeled impacts, and operating capacity.

EPA Comment #2C: Coal Gasification Cold and Warm Flare: *The revised SO_2 emissions permit limit for the PES B-351-5, Coal Gasification Cold and Warm Flares (82-0003- 171, MSOP-17) does not ensure that the flare emissions will not contribute to a violation of the 1-hour SO_2 NAAQS. The revised permit limit of 16.28 lb/hr, 30 calendar day rolling average is identical to the 1-hour Critical Emission Value (CEV) that was included in the air modeling demonstration showing attainment of the NAAQS.*

As discussed in Section V.D.2. and Appendix B of EPA's April 23, 2014 "Guidance for 1-Hour SO_2 Nonattainment Area SIP Submissions," longer term average limits (e.g., 30-day rolling average) may be justifiable, so long as they are of at least comparable stringency to a 1-hour limit at the CEV. When setting a longer-term average limit such as the 30-day rolling average limit for the flares, EPA expects that a downward adjustment of the numerical limit would be needed from the 1-hour CEV to compensate for the loss of stringency inherent in applying the longer-term average limit versus a 1-hour limit. Therefore, EPA recommends that TDEC revise the 30-day rolling average limit to provide for a comparably stringent limit to a 1-hour limit established at the CEV to ensure no violations of the NAAQS will reasonably be expected to occur. This may require operational changes to the coal gasification process or installation of additional control equipment to reduce the magnitude and frequency of emissions from the flare unit. The EPA is available to discuss this issue further upon request.

Response: The 30-day rolling average limit was adjusted downward from 16.28 lb/hr to 14.6 lb/hr (highest 30-day rolling average from CY 2020, and the highest 30-day RA observed during all modeled years with no

modeled exceedances of the NAAQS). While we agree with the concept that a 30-day rolling average should be of comparable stringency to the CEV, calculating a comparable value is difficult in practice because most hourly emission rates from the flare is zero, use of EPA's compliance ratio methodology produces a 30-day rolling average that is higher than the CEV, and there is no alternative calculation of comparable stringency for sources that operate only intermittently. Tennessee used EPA's compliance ratio method and adjusted the result downward to ensure that the 30-day rolling average was not higher than the CEV, and when we consider how the flare typically operates, we believe that this limit would be comparably stringent to the CEV. However, in acknowledgement of EPA's concerns, we made a final adjustment to the limit based on the model outputs.

EPA Comment #2D: Parametric monitoring*: The EPA is available for further discussions on the enforceable parameters to ensure practical enforceability for the B-248 and Primester monitoring parameters.*

Response: The limits for both Eastman's hazardous waste incinerators and Primester's cellulose scrap recovery process are practicably enforceable because each permit specifies the specific monitoring, recordkeeping, and reporting, including requirements for data collection (e. g., collect at least one data point every 15 minutes whenever the source is in operation); averaging periods and calculation of averages; and missing data procedures. For Eastman's hazardous waste combustors, these procedures are included in Appendix 5 of SIP permit 082237. For Primester, these procedures are specified in the facility's Title V permit[1].

EPA Comment 3A: 202 Emission and Attainment Inventory: *The EPA offers the following comments on the development of the 2022 emission inventory:*

- *Please include a table summarizing total SO_2 emissions for each data source category.*

  Response: SO_2 emissions for each data source category are summarized in Table 5-9. Tennessee updated the table by combining Eastman and Primester to show total point source emissions instead of breaking point source emissions down by facility.

- *The prehearing submission includes a link to the EPA's 2016v1 and 2016v2 inventory, but no emission file names were included. Please provide the name of the EPA's emission modeling files used to calculate the area source emissions.*

  Response: Updated to add file names and pathways.

- *For footnote 44, please explain why the emission value are different from the emissions reported to the emission inventory system (EIS) for the 2017 Eastman Facility wide emissions.*

  Response: 2017 Boiler emissions in Table 5-1 were corrected from 10,624 tons to 10, 566 tons.

- *Please explain why the 2022 emissions in Table 5-1 are different from Attachment A and the emissions reported to EIS for the 2017/2022 Eastman Facility wide emissions.*

  Response: 2022 Boiler emissions in Table 5-1 were corrected from 3,375 tons to 3,334 tons.

1 The emission limit and monitoring requirements of Title V permit were adopted into the SIP based on the model outputs and discussions with EPA. Primester's general monitoring requirements (see Conditions E2-10, E2-11 and E2-12 of Title V Operating Permit 574994) were not adopted into the SIP but are necessary for compliance with 40 CFR §70.6(a)(3).

- *Table 5-3 has a typo for 2037 emissions. Based on the Attachment, it should be 7,337 tons per year.*

  Response: The value in Table 5-3 was corrected in the final submittal.

- *In Table A-1, Footnote 2, TDEC mentions that the 2022 national emission inventory (NEI) value for Eastman emission unit, B-334-1 is incorrect in the EIS. EPA recommends TDEC submit an update to the 2022 NEI to correct the emissions data for emission unit B-334-1.*

  Response: TDEC's Emission Inventory group will follow up on this issue.

EPA Comment 3B: Maintenance Demonstration:

- *The redesignation request and maintenance plan are standalone SIP submissions. The EPA recommends TN remove the following attainment SIP reference in section 6.0 – Maintenance plan: Tennessee submitted a modeled attainment demonstration on February 9, 2023, which demonstrated that the area would attain the NAAQS at the maximum allowable emission rate (or, for some small sources, the maximum uncontrolled hourly emission rate), for all modeled emission sources. This statement suggests where a state has submitted an attainment plan, the plan in some cases serve as a maintenance plan for the area. However, this statement refers to an attainment SIP approved by the EPA. It also indicates in certain cases that the attainment SIP modeling reflects all enforceable measures needed to attain the standard and demonstrate maintenance.*

  Response: The underlined statement was removed from the redesignation request.

- *Any future growth, operational changes and/or emission reductions measures accounted for in the projected inventory should be reflected in the air model analysis to show attainment of the 1-hour standard and demonstrate maintenance through 2037. The prehearing modeling files appears to exclude the plastics processing plant. It is unclear what future growth and emission reduction measures support the modeled maintenance demonstration. Alternatively, if a separate modeling run includes this information, the EPA requests the updated inputs for review as soon as practicable.*

  Considering TDEC's maintenance demonstration is based on air dispersion modeling analysis rather than a comparison of attainment and projected actual emissions, the EPA recommends the final redesignation and maintenance demonstration rely on one modeling analysis that reflects existing enforceable control measures and the future growth and operational changes to ensure compliance with the redesignation and maintenance criteria at section 107(d)3(E)(i), (E)(iii) and E(iv) (i.e., demonstrates the area has attained the SO2 standard based on permanent and enforceable emission reduction/control measures and maintenance through 2037.

  Response: Section 5.2.1.1 of the redesignation request states, "The maintenance year inventory also reflects the addition of three natural gas boilers and a proposed plastics processing operation and methanolysis plant." The plastics processing operation and methanolysis plant are part of a single project in which plastic waste and unprocessed polyethylene terephthalate (PET) are converted into feedstock for the methanolysis plant, which produces processes PET waste from recycled plastic into its corresponding monomers (dimethyl terephthalate and ethylene glycol) using methanol, sodium hydroxide. There are no SO_2 emissions from the plastics processing operation, and the redesignation request was updated to remove it.

- *The EPA recommends TDEC explain the purpose or benefit of relying on projected allowable emissions rather than projected actuals.*

  Response: Section 5.2.1.1 of the SIP narrative explains the benefit of relying upon projected allowable emissions rather than projected actuals. State plans may generally demonstrate that the plan will provide for maintenance of the NAAQS by either showing that future emissions will not exceed the level of the attainment inventory, or by modeling to show that the future mix of sources and emission rates will not cause a violation of the NAAQS. The 2037 point source emissions are higher than the base year because Tennessee developed the projection using the same ambient air quality modeling used to demonstrate attainment of the NAAQS. For example, the model accounts for expected growth at Eastman Chemical Company during the 10-year maintenance period (i.e., the construction and startup of three new natural gas-fired boilers and the methanolysis plant). The model also assumes that the remaining coal-fired boilers (B-83 and B-325 powerhouses) continuously operate at their maximum allowable hourly emission rate for the entire year, while the base year inventory is representative of actual boiler operation at submaximal emission rates. Finally, the future year inventory does not consider reductions that were not relied upon to demonstrate attainment and maintenance of the NAAQS, such as the requirement to shut down B-83 Boilers 18, 19, and 20 for compliance with Tennessee's Regional Haze SIP. To summarize, the future year inventory includes a mix of operational changes and projected growth at Eastman that is accounted for the in the air quality modeling and that, notwithstanding the higher annual emissions, will not cause or contribute to a NAAQS violation.

- *Section 5.0: The EPA recommends TDEC replace the phrase "nonattainment area's control strategy" with "demonstrating maintenance with the 2010 SO2 NAAQS."*

  Response: Section 5.0 was updated in accordance with EPA's comment.

- *The EPA recommends TDEC revise the following statement in section 6.0: "As discussed in Section 4.0, attainment of the NAAQS is based on ~~permanent and~~ enforceable emission reductions implemented for Eastman Chemical Company's coal-fired boilers, and other SO_2 emitting sources at the facility ~~as well as other federally enforceable emission limits~~ and made permanent in the Tennessee SIP ~~as to ensure that other existing sources will not cause or contribute to nonattainment~~."*

  Response: Section 6.0 was updated in accordance with EPA's comment.

EPA Comment 3C: Monitoring Network:

- *The EPA recommends TDEC revise the following statement: "Should Tennessee petition to discontinue the operation of any monitor in the area, the Tennessee Department of Environment and Conservation's…"*

  Response: Section 6.0 was updated in accordance with EPA's comment.

- *Should a request from TDEC to discontinue any monitor in the Area be approved, the EPA recommend the State commit to revise the maintenance plan accordingly to reflect future changes to the Area's monitoring network.*

Response: Tennessee commits to the continued operation of a monitoring network, and we will work with EPA to ensure that all regulatory requirements and guidelines are met if we elect to discontinue the operation of an ambient monitor in the area. However, it is unclear if a revised maintenance plan would be required under all foreseeable circumstances, so an explicit commitment to revise the maintenance plan was not included in the final redesignation request.

EPA Comment 3D: Verification of Continued Attainment:

- *The EPA suggests the maintenance plan show how the air agency will track maintenance progress in the Area regardless of how the maintenance demonstration is determined. The EPA recommends TDEC revise the following statement to read: "Tennessee will track the ~~Tracking of progress~~ continued attainment and ~~of the~~ maintenance progress ~~plan is not required because all of the~~ through air quality monitoring pursuant to 40 CFR part 58 and enforcement of the SIP and control measures ~~proposed control measures have been installed and are operating. Tennessee will track continued attainment and maintenance of the NAAQS through air quality monitoring.~~"*

  Response: Section 6.0 was updated in accordance with EPA's comment.

EPA Comment 3E: Contingency Measures:

- *The contingency measures for an attainment SIP (pursuant to section 172(c) of the Act) are established to address when an area does not meet reasonable further progress towards attainment or attain the NAAQS by the statutory attainment date. Contingency measures for a maintenance plan are established to address a NAAQS exceedance or violation after an Area has been legally redesignated to attainment. For these reasons, the EPA recommends TDEC remove the calendar years 2024 thru 2027 and 2028 as part of the maintenance plan triggered event.*

  Response: Tennessee deleted the specific calendar years and added "during any maintenance period approved pursuant to CAA §§175a(a) and (b)…" in the SIP narrative and in permit 082223. We agree broadly with EPA's comment, but since the SIP permit does not expire, it was necessary to add language to clarify that the contingency measures would be required beyond the end of the 20-year maintenance period.

- *The EPA recommends TDEC clarify when the air agency intends to notify the EPA of a triggered event.*

  Response: The SIP narrative was updated to state that Tennessee will notify EPA of any triggering event. SIP permit 082223 was not updated to add this requirement because the permit imposes requirements upon Eastman and not upon the permitting authority.

- *The EPA recommends the contingency measures system audit consider sources outside the Area.*

  Response: Tennessee updated the narrative to commit to a review of sources outside of the nonattainment area, as appropriate, in its trigger-level response. Tennessee also revised the narrative to remove a reference to the coal gasification flare, since the response would not be limited to a single emission source. SIP permit 082223 was not updated because the contingency measures required by the permit require a system audit for all SO_2 emission sources at Eastman Chemical Company (i. e., the system audit was not limited to the flare) and because the SIP permit does not impose

requirements upon other sources within the nonattainment or nearby sources that could cause or contribute to a NAAQS exceedance.

- *The EPA recommends TDEC remove all references to the 2023 attainment SIP.*

  Response: Tennessee updated the narrative to remove all references to the 2023 attainment demonstration.

- *The EPA suggests TDEC apply the contingency measures comments for the maintenance plan to the draft contingency measure in operating permit #082337, condition G4.*

  Response: Permit 082237 was revised to match the SIP narrative.

II. Eastman Chemical Company

The following comment was received from Eastman Chemical Company on March 20, 2025.

As we discussed yesterday, preliminary screening data for SO_2 emissions from the Acid Con Sludge Recovery Process (Source Number 224 in Permit 082237) shows that additional control of SO_2 emissions from the batch reactors and/or sludge handling belt may be required to meet the emissions limitation specified in S4-1 of Permit 082237 under maximum operating conditions.

Eastman is currently preparing a construction permit application to authorize the installation of a new, fiberglass caustic scrubber to achieve safe, reliable, and effective reduction of SO_2 emissions from this process. The application will also include a temporary mitigating action to add a caustic supply to the existing scrubber on the batch reactors (largest source of SO_2 emissions from this process). Process modeling/simulation predicts that this addition will be at most 40% effective at reducing SO_2 in the vent stream from the batch reactors. However, this temporary system could serve as a "bridge" to the more robust emissions control system, i.e., new, permanent caustic scrubber. This is a similar approach that was taken with B-83 Powerhouse on Boilers 23 and 24 where a temporary DSI (Dry Sorbent Injection) system was operated in the interim period while a permanent system was designed and installed.

Initial responses from vendors indicate that a fiberglass scrubber could take 6 to 9 months for delivery. Consequently, Eastman would like to request that TDEC include additional time in Permit 082237, Section S4-1 after permit issuance for this emissions control project to be executed. As stated previously, this is contingent on the emissions testing being conducted on this process in April and May indicating that additional emission controls are required to meet the hourly emissions limitation. Eastman would provide TDEC with routine updates, at TDEC's discretion on frequency, as to the status of the project until the project is completed, or such time that Eastman determines, based on required emissions testing results, that the project is not needed for compliance.

Response: Condition S4-1 of SIP permit 082223 was revised to state that the emission limit for PES B-55-1 will become effective 270 days after permit issuance and that performance testing must be completed 360 days after permit issuance (i. e., the compliance date plus 90 days). Condition S4-2 of SIP permit 082223 was revised to state that the source-specific reporting requirements will become effective 420 days after permit issuance (i. e., the performance test date plus 60 days).

Attachment N
Board Order 25-012

STATE OF TENNESSEE
AIR POLLUTION CONTROL BOARD

IN THE MATTER OF:	)	
	)	
PROPOSED STATE IMPLEMENTAITON PLAN	)	ORDER NO. 25-012
AMENDMENT TO REQUEST REDESIGNATION	)	
OF THE SULLIVAN COUNTY ONE-HOUR SO_2	)	
NONATTAINMENT AREA TO ATTAINMENT	)	

BOARD ORDER

The Sullivan County, Tennessee sulfur dioxide (SO_2) nonattainment area includes the portion of Sullivan County encompassing a circle having its center at coordinates 36.5186 N; 82.5350 W (B-253 powerhouse, Eastman Chemical Company), and having a three-kilometer radius. Between 2008 and 2010, air quality monitoring at one monitor within this region indicated that the annual average SO_2 concentrations exceeded the 75 ppb National Ambient Air Quality Standard (NAAQS), and EPA designated the area as nonattainment for the one-hour SO_2 NAAQS, effective October 4, 2013.

The Tennessee Air Pollution Control Board finds that the Sullivan County Nonattainment Area has attained the 2010 one-hour SO_2 NAAQS based on an attaining three-year design value for the period 2020-2022 and upon air dispersion modeling that demonstrates future maintenance of the NAAQS. The Board approves the submittal of a redesignation request and maintenance plan to redesignate the area to attainment pursuant to §107(d)(3) of the Clean Air Act.

Approved on June 11, 2025, by the members of the Tennessee Air Pollution Control Board as follows:
