VMT	Vehicle miles traveled
W	West

EXECUTIVE SUMMARY

The Kingsport, Tennessee SO_2 nonattainment area includes the portion of Sullivan County encompassing a circle having its center at coordinates 36.5186 N; 82.5350 W (B-253 powerhouse, Eastman Chemical Company), and having a three-kilometer radius. Between 2008 and 2010, air quality monitoring at one monitor within this region indicated that the ambient SO_2 concentrations exceeded the 75 ppb one-hour SO_2 National Ambient Air Quality Standard (NAAQS) promulgated in 2010, and EPA designated the area as nonattainment for the one-hour SO_2 NAAQS, effective October 4, 2013.

Tennessee submitted attainment demonstrations on May 11, 2017, and February 9, 2023, and projected that the area would attain the NAAQS based on SO_2 emission reductions achieved by: (1) Eastman's conversion of the B-253 powerhouse (Boilers 25-29) from coal to natural gas operation; and (2) installation of dry sorbent injection (DSI) controls on Boilers 23 and 24 of Eastman's B-83 powerhouse; and (3) adoption of revised emission limits for Eastman's B-83 and B-325 powerhouses. Air quality monitoring data for 2020 through 2022 indicates declining sulfur dioxide concentrations within the nonattainment area, and the design value of each monitor in the nonattainment area shows attainment of the NAAQS.

Tennessee is petitioning EPA for redesignation of the Sullivan County one-hour sulfur dioxide nonattainment area to attainment for the 2010 one-hour SO_2 NAAQS, based on an attaining three-year design value for the period 2020-2022 and upon air dispersion modeling that demonstrates future maintenance of the NAAQS. This petition is submitted pursuant to §107(d)(3) of the Clean Air Act, which specifies the requirements for redesignation of nonattainment areas. This petition will show that the nonattainment area has attained the NAAQS and that the observed reduction in SO_2 levels is due to permanent and enforceable emission reductions. In addition, an emissions inventory is included, which indicates declining SO_2 emissions between 2017 and 2022. As SO_2 emissions continue to decline, the region is likely to remain in attainment of the NAAQS in the future. However, this petition includes contingency measures that may be put into place, if necessary, to correct NAAQS exceedances that may occur after redesignation of the area to attainment.

1.0 INTRODUCTION

This petition is submitted to the United States Environmental Protection Agency (EPA) to request redesignation of the Sullivan County, Tennessee sulfur dioxide nonattainment area from nonattainment to attainment for the one–hour SO_2 National Ambient Air Quality Standard (NAAQS), pursuant to §107(d)(3) of the Clean Air Act (CAA). The Act specifies the following requirements for redesignation of nonattainment areas:

1. The Administrator determines that the area has attained the national ambient air quality standard;

2. The Administrator has fully approved the applicable implementation plan for the area under section 110(k);

3. The Administrator determines that the improvement in air quality is due to permanent and enforceable reductions in emissions resulting from implementation of the applicable implementation plan and applicable Federal air pollutant control regulations and other permanent and enforceable reductions;

4. The State containing such area has met all requirements applicable to the area under section 110 and part D.

5. The Administrator has fully approved a maintenance plan for the area as meeting the requirements of section 175A; and

EPA enumerates specific requirements for each of these criteria in the Agency's September 4, 1992 memorandum, *Procedures for Processing Requests to Redesignate Areas to Attainment* (Calcagni memo)[1]. The Agency provided additional pollutant-specific guidance for SO_2 nonattainment areas in the April 23, 2014, memorandum, *Guidance for 1-Hour SO_2 Nonattainment Area SIP Submissions* (Page memo)[2]. Tennessee is petitioning EPA for redesignation of the nonattainment area to attainment based on an attaining three-year design value for the period 2020-2022 and upon air dispersion modeling that projects attainment of the NAAQS based on permitted allowable emissions and/or the maximum uncontrolled hourly emission rates[3] for small fuel-burning sources. This document demonstrates that the Sullivan County area meets the above requirements and can petition the EPA for redesignation in lieu of an attainment demonstration. Submission of an attainment demonstration in place of this redesignation request would not necessarily result in additional controls, since ambient air quality data indicates that the area is attaining the NAAQS, and since attainment has been achieved using existing controls (see Section 2.0 for additional information).

[1] Available online at https://www.epa.gov/sites/default/files/2016-03/documents/calcagni_memo_-_procedures_for_processing_requests_to_redesignate_areas_to_attainment_090492.pdf.

[2] Available online at https://www.epa.gov/sites/default/files/2016-06/documents/20140423guidance_nonattainment_sip.pdf

[3] For modeling purposes, "permitted allowable" means the hourly emission rate in pounds per hour listed in the emission source's construction or operating permit, and "maximum uncontrolled hourly emission rate" means the unrestricted maximum physical and operational capacity to emit sulfur dioxide, without restriction by any permit term or limit. Modeling of the maximum uncontrolled hourly emission rate is used as applicable to determine whether, even without enforceable restrictions on some sources, the area can attain the NAAQS if the respective emission sources emit at maximum possible uncontrolled hourly levels. The maximum uncontrolled hourly emission rate includes no assumptions beyond the design capacity of the unit and the fuel(s) burned. Calculation and documentation of maximum uncontrolled hourly emissions for fuel burning and process emission sources are included in Attachment K.

Sulfur dioxide (SO_2) is a highly reactive gas emitted from fossil fuel combustion at power plants and other industrial facilities and from industrial processes (e. g., the extraction of metal from ore)[4]. In June 2010, EPA promulgated a new one-hour primary SO_2 NAAQS of 75 parts per billion (ppb). This one-hour primary standard is met when the three-year average of the annual (99th percentile) of the daily maximum one-hour average concentrations is less than or equal to 75 ppb, as determined in accordance with Appendix T of 40 CFR 50[5]. EPA revised the air quality standard for SO_2 based on an integrative synthesis of the entire body of evidence on human health effects associated with ambient SO_2 and upon the results of quantitative exposure and risk assessments reflecting this evidence. In considering the entire body of evidence, EPA chose to focus primarily on respiratory morbidity following short-term exposure to SO_2 (5 minutes to 24 hours), for which the Agency's Integrated Science Assessment[6] found a causal relationship[7].

The Kingsport, Tennessee SO_2 nonattainment area includes the portion of Sullivan County encompassing a circle having its center at coordinates 36.5186 N; 82.5350 W (B-253 powerhouse, Eastman Chemical Company), and having a three-kilometer radius (**Figure 1-1**). Between 2008 and 2010, air quality monitoring at one monitor within this region indicated that the one-hour average SO_2 concentrations exceeded the 75 ppb NAAQS, and EPA designated the area as nonattainment for the one-hour SO_2 NAAQS, effective October 4, 2013[8].

2.0 AIR QUALITY

A redesignation request must demonstrate that the area is attaining the applicable NAAQS, and there are two components to this demonstration, which should be considered interdependently: ambient monitoring and air quality modeling. Each component of this demonstration is discussed separately below.

2.1 Ambient Monitoring Data

For redesignation of SO_2 nonattainment areas, any available monitoring data must indicate that all monitors in the affected area are meeting the standard as stated in 40 CFR §50.17 using data analysis procedures specified in 40 CFR part 50, Appendix T.

Ambient monitoring data used for redesignation purposes must meet several criteria: (1) ambient monitoring data should be representative of the area of highest concentration[9]; (2) ambient monitors should remain at the same location for the duration of the monitoring period required for demonstrating attainment; (3) data should be collected and quality-assured in accordance with 40 CFR 58 and recorded to be available for the public to review; and (4) the Regional office should verify that the integrity of the air quality monitoring network has been preserved.

Following promulgation of a new or revised NAAQS, EPA is generally required to designate areas as nonattainment, attainment, or unclassifiable, pursuant to CAA §107(d)(1) within two years[10]. EPA used existing ambient monitoring data from 2009 through 2011 to identify violations of the 2010 one-hour SO_2 NAAQS in its first round of designations and deferred other areas with insufficient or missing data.

No later than one year after the promulgation of a new or revised NAAQS, CAA §107(d)(1)(A) requires each state governor to recommend air quality designations to EPA, and EPA must review the state's recommendations for adequacy. Tennessee made initial recommendations to EPA on May 26, 2011, and revised its recommendations on June 3, 2011, and January 28, 2013. Following the submittal of Tennessee's recommendation and consultation with the governor's designee, EPA designated a portion of Sullivan County as nonattainment for the one-hour SO_2 NAAQS. EPA's designation was based on data from an ambient monitor operated by Eastman Chemical Company at Ross N. Robinson Middle School in Kingsport (**Table 2-1**)[11].

[9] In cases where air quality monitors for the affected area are located in the area of maximum concentration, the EPA may be able to use the data from the monitors alone to make the attainment determination for the affected area without need for additional air quality modeling beyond what the previously approved attainment demonstration has provided.

[10] EPA is generally required to designate areas as nonattainment, attainment, or unclassifiable, pursuant to CAA §107(d)(1) within two years, but if the Administrator has insufficient information to make those designations within two years, EPA has the authority to extend the deadline for completing designations by up to one year. On July 27, 2012, EPA extended the deadline for SO_2 designations to June 3, 2013.

[11] Prior to 2016, the Ross N. Robinson monitoring site was owned and operated by Eastman Chemical Company, and EPA includes Eastman's historical data on its air quality monitoring site. In 2016, the Tennessee Department of Environment and Conservation co-located a monitor at the same site, and that site has been used since 2016 for compliance purposes. Eastman's historical data are available on AQS because the old data from this site were used for designation purposes.

Table 2-1: Ross N. Robinson Ambient Data, 2009-2011					
Monitor Name	AQS ID	Highest-Fourth-High (H4H) SO_2 Concentration (ppb)			Three-Year Design Value (2009-2011)
		2009	2010	2011	
Ross N. Robinson	47-163-6001	158.5	231.5	198.8	196.3

CAA §107(d)(3)(E)(i) states that the Administrator may not promulgate a redesignation of a nonattainment area (or portion thereof) to attainment unless the Administrator determines that the area has attained the national ambient air quality standard.

Following designation of the area to nonattainment, Eastman implemented a number of control strategies, as discussed in Section 4.0, and installed a second monitor at Skyland Drive for planning purposes[12]. Tennessee installed its own monitor at Skyland Drive in 2016 and two additional monitors at Andrew Johnson Elementary School and Happy Hill, and those monitors began operation in 2019 (see **Figure 1-1** for active monitor locations). Following the implementation of Eastman's control strategy between 2013 and 2021, declining ambient concentrations were observed at all monitors (**Table 2-2**). In 2022, the three-year design values (three-year average of 2020, 2021, and 2022) were below the NAAQS at all monitoring locations (**Table 2-3**). Tennessee's redesignation request is based on the most recent three years of data, which show no violations of the SO_2 NAAQS for the three-year average of 2020 through 2022. These data are represented graphically in **Figure 2-1**.

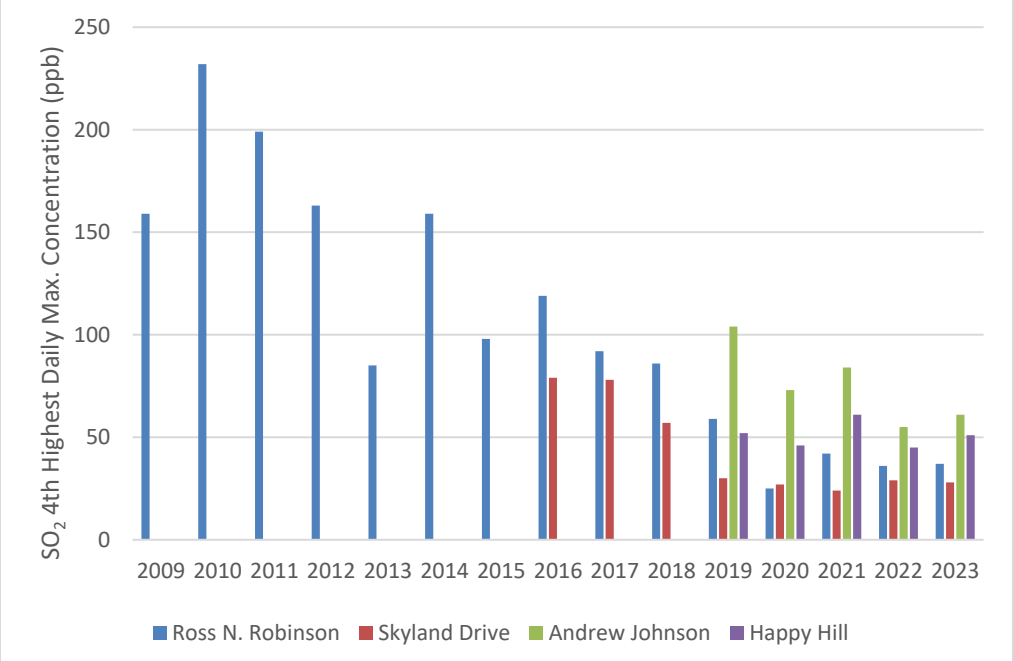

Figure 2-1: SO_2 Trends, 2009-2023[13]

[12] Industry-generated data do not, in general, meet EPA's quality assurance requirements, and Eastman's data for this site are not uploaded to AQS. Ambient data for Happy Hill are available for 2016 and later, when Tennessee began operating its own monitor at the site.

[13] 2023 data are preliminary.

Table 2-2: Ambient Data from Active Monitors									
Monitor Name	**AQS ID**	**99th Percentile Daily Maximum One-Hour SO_2 concentration (ppb)**							
		2017	**2018**	**2019**	**2020**	**2021**	**2022**	**2023**	**2024**
Ross N. Robinson	47-163-6001	92	86	59	45	42	36	37	40
Skyland Drive	47-163-6002	78	57	30	27	24	29	28	30
Andrew Johnson	47-163-6003			104	73	84	55	61	56

Monitor Name	**AQS ID**	**Three-Year Average of 99th Percentile Daily Maximum One-Hour SO_2 concentration (ppb)**					
		2017-2019	**2018-2020**	**2019-2021**	**2020-2022**	**2021-2023**	**2022-2024**
Ross N. Robinson	47-163-6001	79	63	49	41	38	38
Skyland Drive	47-163-6002	55	38	27	27	27	29
Andrew Johnson	47-163-6003			87	71	67	57
Happy Hill	47-163-6004			53	50	52	49

[14] Data from 2018 are not included because the Happy Hill monitor operated for only 21 days in 2018.

Ambient SO_2 concentrations within the nonattainment area vary with the distance of each monitor from the primary SO_2 source[15], and the four monitors within the nonattainment area vary by distance and spatial location relative to the emission source. Tennessee's ambient monitoring data demonstrate that the area has attained the NAAQS, and Tennessee has met EPA's ambient monitoring requirements outlined in the 1992 Calcagni memo as follows:

Location and Representativeness: The ambient monitors have remained at the same location for the duration of the monitoring period required for demonstrating attainment. The Ross N. Robinson monitoring site is located northeast of Eastman Chemical Company's Tennessee Operations, approximately 2 km from the centroid of the nonattainment area[16]. Skyland Drive is located at the eastern edge of the nonattainment area, approximately 3 km from the centroid. Notwithstanding the relatively longer distance from the nonattainment area, Skyland Drive has been important because of the monitor's elevation relative to the remainder of the nonattainment area (approximately 1,700 feet above mean sea level, compared to an elevation of 1,200 feet above mean sea level in the vicinity of the Holston River). Historically, the Skyland Drive monitor was able to detect elevated SO_2 concentrations not observed at Ross N. Robinson, presumably due to plume rise from Eastman's B-83 and B-253 powerhouses.

Andrew Johnson and Happy Hill are newer monitors and were installed specifically to capture ambient data closer to the facility. Andrew Johnson is 1 km northeast of the centroid and is roughly in a direct line between the B-83 stacks and the Ross N. Robinson monitor. Happy Hill is 2 km west-southwest of the centroid and is intended to capture ambient data during periods when the wind direction is opposite of the prevailing winds (typically from the SW). The Happy Hill site is also relatively near to Eastman's B-325 powerhouse and coal gasification operations and may be better suited to detect ambient concentrations affected by those sources.

Following implementation of Eastman's initial control strategy between 2013 and 2018 (repowering of B-253 boilers from coal to natural gas), ambient data from RNR and Skyland Drive declined such that those monitors indicated no exceedances of the NAAQS for 2018 and afterward. Similarly, the H4H concentrations at Happy Hill have not exceeded 75 ppb for all five years of the monitor's operation. However, the Andrew Johnson monitor continued to indicate NAAQS exceedances after beginning operation in 2019, and Eastman began

[15] As discussed in Section 5.2.1, Eastman Chemical Company's Tennessee Operations is the only significant source of SO_2 affecting the nonattainment area.

[16] All distances were calculated as follows: the latitude and longitude of the centroid of the nonattainment area are defined in EPA's designation of the area, and the latitude and longitude of each monitor were obtained from EPA's interactive map of air quality monitors (https://www.epa.gov/outdoor-air-quality-data/interactive-map-air-quality-monitors). NOAA's latitude/longitude distance calculator (https://www.nhc.noaa.gov/gccalc.shtml) was used to calculate the distance of each monitor from the centroid..

Location	Latitude	Longitude
Centroid of Nonattainment Area (B-253 Powerhouse)	36.5186° N	82.5350° W
Andrew Johnson Monitor	36.5264° N	82.5287° W
Happy Hill Monitor	36.5130° N	82.5505° W
Ross N. Robinson Monitor	36.5326° N	82.5163° W
Skyland Drive Monitor	36.5211° N	82.5024° W

Location	Distance from Centroid (km)
Andrew Johnson Monitor	1
Happy Hill Monitor	2
Ross N. Robinson Monitor	2
Skyland Drive Monitor	3

the implementation of both a provisional control strategy in 2019 (portable DSI) and initiated work on a permanent control strategy (permanent DSI), which was completed in 2021. Following implementation of the permanent control strategy in 2021, there were no further exceedances of the NAAQS in 2022 and 2023, the design value indicated attainment of the NAAQS. As discussed in Section 2.2 (Air Quality Modeling), Tennessee modeled the SO_2 emissions from nearby sources, and the model outputs indicated that the areas of highest modeled concentration were located in the vicinity of the Andrew Johnson monitor for four model runs, and the highest concentrations for the remaining two runs were located in the vicinity of the Happy Hill site.

As discussed in Section 2.2, ambient monitoring data collected at the Andrew Johnson monitor (47-163-6003) are representative of the area of highest concentration.

Quality Assurance and Data Completeness: Ambient data are collected and quality-assured in accordance with 40 CFR Part 58 and are recorded to be available for public review. Section 3(b) of Appendix T to 40 CFR Part 50 states that a one-hour SO_2 design value is valid if it encompasses three consecutive calendar years of complete data, a year meets data completeness requirements when all four quarters are complete, a quarter is complete when at least 75% of the sampling days for each quarter have complete data, and a sampling day has complete data if 75% of the hourly concentration values, including State-flagged data affected by exceptional events which have been approved for exclusion by the Administrator, are reported. **Table 2-4** summarizes the data completeness for the Sullivan County monitors from 2019 through 2023.

Table 2-4: Data Completeness

Monitor ID	Local Site Name	Year	Number of Complete Hours	Observation Percent
47-163-6003	Andrew Johnson School	2019	8,141	93%
		2020	8,170	93%
		2021	8,284	95%
		2022	8,308	95%
		2023	8,262	94%
		2024	8,277	94%

		2020	8,068	92%
		2021	8,189	93%
		2022	8,171	93%
		2023	8,282	95%
		2024	7,967	91%
Data source: https://www.epa.gov/outdoor-air-quality-data/interactive-map-air-quality-monitors				

Monitoring Network Integrity: EPA's Region 4 office periodically verifies that the integrity of the air quality monitoring network has been preserved through Technical Systems Audits (TSAs). EPA performed a TSA for the SO_2 monitors in 2019 and found that the ambient air monitoring program was maintained in accordance with State quality system documents and that data collected within the State's ambient air monitoring network were of sufficient quality for regulatory decisionmaking purposes. Issues identified during the TSA were resolved with the development and implementation of a corrective action plan, and on October 22, 2020, EPA found that all findings and concerns identified in the 2019 TSA were successfully resolved.

2.2 Air Quality Modeling

The second component of Tennessee's analysis relies upon air quality modeling of SO_2 emitting sources in the nonattainment area, including enforceable control measures, to demonstrate that the area has attained the NAAQS pursuant to CAA §107(d). Although supplemental modeling is not required for regional pollutants such as ozone or fine particulate matter, a monitoring network may not be sufficient to represent the air quality throughout the nonattainment area for directly-emitted pollutants such as sulfur dioxide. If there are no air quality monitors located in the affected area, or if analyses indicate that none of the monitors is located in the area of maximum concentration, then air quality dispersion modeling will generally be needed to estimate SO_2 concentrations throughout the area and to demonstrate that emission sources are not causing or contributing to violations of the NAAQS.

Tennessee modeled the portion of Sullivan County encompassing a circle centered at coordinates 36.5186 N; 82.5350 W (Eastman Chemical Company's B-253 powerhouse) and having a three-kilometer radius (i. e., the portion of Sullivan County designated as nonattainment) as the modeling domain. Model receptors were placed at 50-meter intervals along the Eastman fenceline, public access roads, and riverbanks and at 100-meter intervals throughout the remainder of the nonattainment area. Terrain elevations were developed from the National Elevation Dataset (NED) acquired from USGS, using EPA's terrain processor (AERMAP version 18081). Receptors were not placed in the interior of Eastman's facility, since access to the property is controlled via fences, gates, and other restrictions to limit public access to the site. Tennessee used onsite meteorological data developed by Eastman and updated/supplemented Eastman's data with the 2011 NLCD and with the application of the latest version of AERMET (version 22112). To determine background SO_2 concentrations, Tennessee used data from a monitor located at Mammoth Cave National Park in Kentucky (AQS ID 21-061-0501) that was deemed representative based on the terrain similarity, the monitor location relative to nearby sources, and the completeness of the monitoring record, to develop "seasonal by hour of the day" background concentrations.

EPA's Guideline on Air Quality Models (Appendix W to 40 CFR Part 51) states that all sources expected to cause a significant concentration gradient in the vicinity of the source of interest should be explicitly modeled and that the number of such sources is expected to be small except in unusual cases. Other sources, which do not cause significant concentration gradients in the vicinity of the primary source, should be included in the modeling via monitored background concentrations. Model runs were performed for all Eastman sources except for one batch chemical manufacturing operation[17] and for all nearby sources affecting the nonattainment area. Sources were modeled either at the allowable emission rate for sources where Tennessee requested the adoption of emission limits into the SIP and at the maximum uncontrolled hourly emission rate for other sources. Model inputs for Eastman's coal-fired boilers are shown in **Table 2-5**, and model inputs for other sources (Eastman and Domtar Paper Company) are shown in **Table 2-6**.

The results of the model runs are shown in **Table 2-7.** Table 2-7 shows the maximum overall impact for each run (modeled highest-fourth-high concentration) and demonstrates that at the critical emission value of 1,600 lb/hr[18], there are no violations of the SO_2 NAAQS within the nonattainment area. The worst-case model run is 2022-0928-1 (Boilers 23, 24, 30 and 31 down; Boilers 18 through 24 operating at 1,600 lb/hr).

[17] Eastman's specialty organic chemicals production (MSOP-25, PES OC-BATCH) was excluded using the criteria enumerated in EPA's March 1, 2011, modeling guidance for the one-hour NO_2 NAAQS.

[18] The *critical emission value* is the hourly emission rate that the model predicts would result in the annual 99th percentile of daily maximum hourly SO_2 concentrations at or below the level of the one-hour NAAQS at all receptors, given representative meteorological data for the area. The critical emission value is based on an apportionment of SO_2 emission rates between B-83 boilers 18-22 and B-325 30-31 at different operating rates.

Table 2-5: Boiler Model Runs										
		Boilers 18-24				Boilers 30-31				
Run	Boiler(s)	SO_2 Emission Rate (lb/hr)	SO_2 Emission Rate (g/s)	Stack Velocity (m/s)	Stack Temperature (K)	SO_2 Emission Rate (lb/hr)	SO_2 Emission Rate (g/s)	Stack Velocity (m/s)	Stack Temperature (K)	Total SO_2 Emission Rate (lb/hr)
2023-0120-1[19]	18, 19, 20, 21, 22	1,600.0	201.60	16.48	447.92					1,600

2023-0120-12	18, 19, 20, 21, 22, 30, 31	846.0	127.79	14.01	441.90	754	95.00	37.19	390.25	1,600

Table 2-6: Other Modeled SO_2 Emission Sources					
ID	Description	Stack Velocity (m/s)	Stack Temperature (K)	Modeled SO_2 Emission Rate (g/s)	Basis
DOMTR_BB	Domtar Biomass Boiler	15.39	449.70	1.44	Allowable emissions from PSD permit 978656 (11.43 lb/hr, daily average). The maximum uncontrolled hourly emission rate is 6.13 lb/hr (i. e., the modeled emission rate is higher than the maximum uncontrolled hourly emission rate).
TAIL_GAS	Tail Gas Incinerator	21.34	644.26	2.75	Allowable emission rate (21.8 lb/hr).
FUGITIVE	Fugitive			1.72E-08[20]	SO_2 emissions from equipment leaks are estimated from equipment counts (i. e., number of pumps, valves, flanges, connectors, etc.) and emission factors plus nontraditional fugitive emissions[21] (estimated as 10% of equipment leaks). There are no numeric emission limits for equipment leaks, and compliance is based on work practice standards (quarterly or annual inspection using audible, visual, or olfactory methods).

[19] Model run ID numbers are not sequential because Tennessee developed multiple runs but later eliminated some runs as redundant. Model run IDs were updated to reflect the most recent runs performed in response to EPA comments.

[20] Fugitive emissions are modeled in g/s*m^2, where the fugitive area is 2,425,384 m^2 (1353.3 m x 1792.2 m).

[21] Fugitive emissions from equipment closures including manways, body flanges, and blind flanges.

Table 2-6: Other Modeled SO_2 Emission Sources					
ID	Description	Stack Velocity (m/s)	Stack Temperature (K)	Modeled SO_2 Emission Rate (g/s)	Basis
253_25	B-253 Powerhouse Boiler 25	25.3	434	0.058	Maximum uncontrolled hourly emission rate at the design heat input.

Table 2-6: Other Modeled SO_2 Emission Sources					
ID	Description	Stack Velocity (m/s)	Stack Temperature (K)	Modeled SO_2 Emission Rate (g/s)	Basis
B55_1C	Organic Acids & Anhydrides Manufacturing	17.70	299.7	0.0857	Uncontrolled emission rate of 0.68 lb/hr. Emissions for this vent were previously believed to be zero, but bag sampling confirmed the presence of small amounts of SO_2.
B55_1E	Organic Acids & Anhydrides Manufacturing	0.12	299.7	0	Emissions for this vent were confirmed to be zero.
B55_1I	Organic Acids & Anhydrides Manufacturing	2.99	299.7	0.0744	Uncontrolled emission rate of 0.59 lb/hr. Emissions for this vent were previously believed to be zero, but bag sampling confirmed the presence of small amounts of SO_2.
B55_1K	Organic Acids & Anhydrides Manufacturing	3.33	307.2	0.0176	Uncontrolled emission rate of 0.14 lb/hr.
B238_1	HTM Furnaces (MF-01 Furnace)	3.81	477.40	1.26E-03	Maximum uncontrolled hourly emission rate at the design heat input [25].
B238_2	HTM Furnaces (MG-01 Furnace)	3.81	477.40	1.26E-03	Maximum uncontrolled hourly emission rate at the design heat input [26].
B238_3	HTM Furnaces (MK-01 Furnace)	9.81	471.90	5.04E-03	Maximum uncontrolled hourly emission rate at the design heat input [27].
B238_4	HTM Furnaces (ML-01 Furnace)	6.10	258.30	7.56E-03	Maximum uncontrolled hourly emission rate at the design heat input [28].
B232_1	Aromatic Acid Manufacturing (Vent UA Catalytic Oxidizer)	7.32	323.00	2.88E-04	Maximum uncontrolled hourly emission rate at the design heat input.
B232_2	Aromatic Acid Manufacturing (Vent UB Regenerative Thermal Oxidizer)	32.93	336.90	1.15E-03	Maximum uncontrolled hourly emission rate at the design heat input.
B232_3	Aromatic Acid Manufacturing (Vent UC Catalytic Oxidizer)	7.01	323.00	2.88E-04	Maximum uncontrolled hourly emission rate at the design heat input.
B256_5	HTM Furnace 5	4.02	449.70	1.68E-03	The maximum uncontrolled hourly emission rate of each furnace at the design heat input is 1.48×10^{-3} g/s.
B256_6	HTM Furnace 6	4.02	449.70	1.68E-03	
B256_8	HTM Furnace 8	4.02	449.70	1.68E-03	

[25] Tennessee identified a small discrepancy between the modeled emission rate (0.010 lb/hr) and the calculated maximum uncontrolled hourly emission rate (0.012 lb/hr) for Furnace MF-01. We believe that this difference is a rounding error with no significance to the model output.

[26] Tennessee identified a small discrepancy between the modeled emission rate (0.010 lb/hr) and the calculated maximum uncontrolled hourly emission rate (0.012 lb/hr) for Furnace MG-01. We believe that this difference is a rounding error with no significance to the model output.

[27] Tennessee identified a small discrepancy between the modeled emission rate (0.040 lb/hr) and the calculated maximum uncontrolled hourly emission rate (0.044 lb/hr) for Furnace MK-01. We believe that this difference is a rounding error with no significance to the model output.

[28] Tennessee identified a small discrepancy between the modeled emission rate (0.060 lb/hr) and the calculated maximum uncontrolled hourly emission rate (0.058 lb/hr) for Furnace ML-01. We believe that this difference is a rounding error with no significance to the model output.

Table 2-6: Other Modeled SO_2 Emission Sources					
ID	**Description**	**Stack Velocity (m/s)**	**Stack Temperature (K)**	**Modeled SO_2 Emission Rate (g/s)**	**Basis**
B272_7	HTM Furnace 7	4.02	449.70	1.68E-03	Permitted allowable for furnaces 5, 6, and 8 (0.04 lb/hr) were divided evenly among all three furnaces (0.0133 lb/hr). The modeled emission rates are greater than the maximum uncontrolled hourly emission rate at the design heat inputs (1.48×10^{-3} g/s for each furnace).
B272_9	HTM Furnace 9	4.02	449.70	1.68E-03	
B272_10	HTM Furnace 10	4.02	449.70	1.68E-03	
CARGLAS1	Cardinal Flat Glass Gas Melting Furnace 1	9.58	574.82	0.41	3.25 lb/hr[29]
CARGLAS2	Cardinal Flat Glass Gas Melting Furnace 2	16.53	517.59	11.97	Allowable emission rate of 95 lb/hr

[29] There appears to be an error in the model input for this run, because the allowable emission rate for this furnace is 32.5 lb/hr.

Table 2-7: Summary of Model Results					
Model Run	Receptor Coordinates		Maximum Impact (ppb)	Nearest Monitor	Distance to Nearest Monitor (km)
	Latitude	Longitude			
2023-0120-1	36.5230	-82.5171	74.82	Ross N. Robinson	1.08
2023-0120-5	36.5073	-82.5525	66.45	Happy Hill	0.65
2023-0120-6	36.5073	-82.5525	67.17	Happy Hill	0.65
2023-0120-7	36.5248	-82.5193	72.36	Andrew Johnson	0.85
2023-0120-9	36.5221	-82.5204	69.97	Andrew Johnson	0.88
2023-0120-12	36.5229	-82.5294	68.98	Andrew Johnson	0.39

The location of each maximum modeled impact relative to the existing monitoring network is shown in **Figure 2-2**. Four of the six maximum modeled impacts, including the overall maximum of 74.82 ppb are located south and southeast of the Andrew Johnson monitor[30], with the remaining highest impacts in the vicinity of the Happy Hill site. When the modeled outputs are considered along with the history of monitored exceedances at Andrew Johnson, Tennessee believes that it is located in the vicinity of the area of highest concentration. All models involve a degree of uncertainty in both the value and location of the modeled concentration, and if the model results alone were considered, it might be arguable that the area of maximum impact is equally near to the Ross N. Robinson monitor rather than the Andrew Johnson site. However, the model outputs cannot be assessed without considering both the proximity of the monitors to the emission source and the monitoring history of the nonattainment area. The Andrew Johnson monitor is nearer to Eastman's B-83 powerhouse, and that monitor indicated NAAQS exceedances that were never observed at the Ross N. Robinson monitoring site. Based on all of these factors, Tennessee believes that the Andrew Johnson monitor is more representative of the maximum impact.

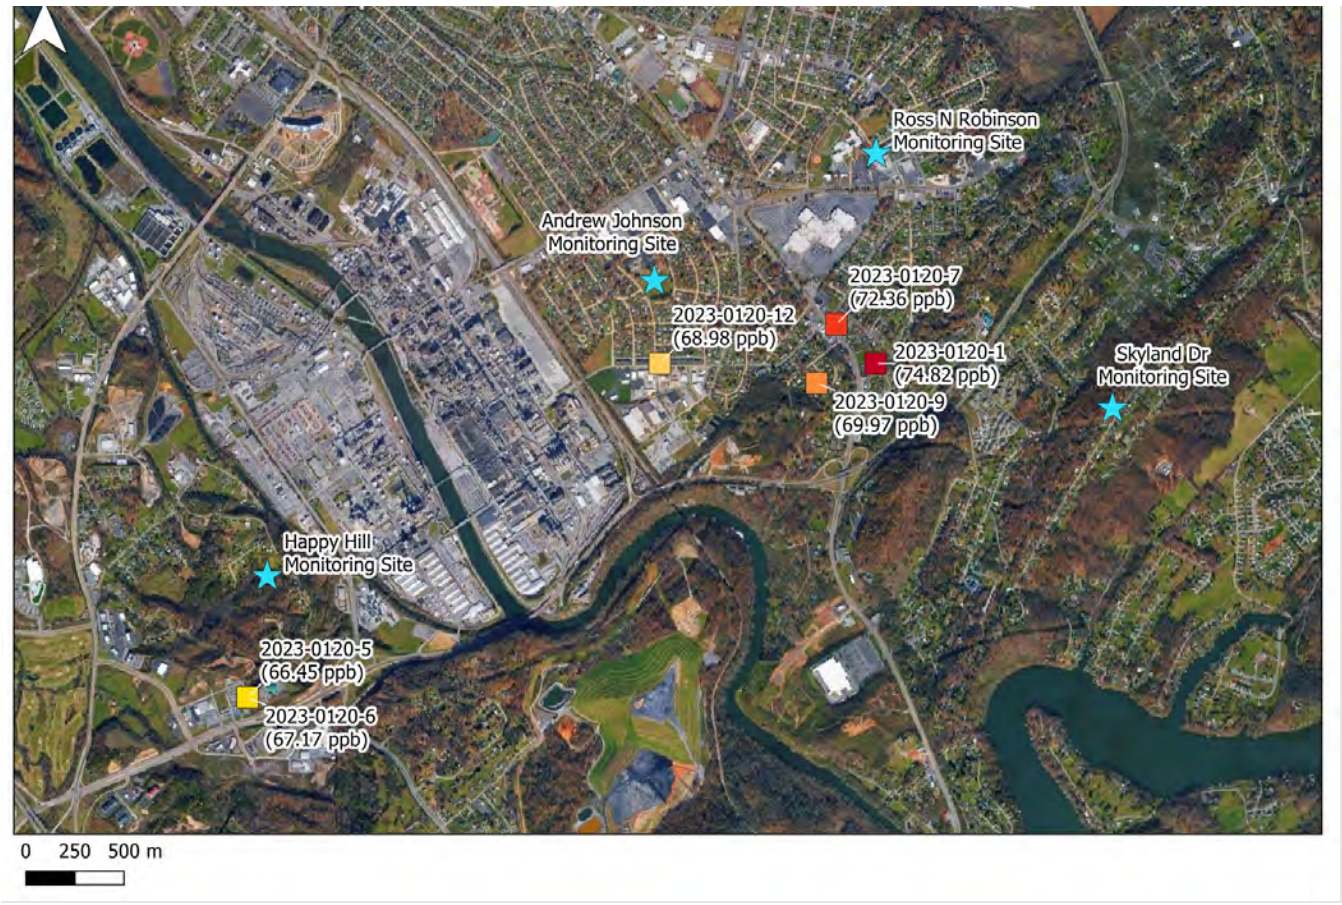

Figure 2-2: Locations of Maximum Modeled Impacts

[30] The highest overall impact is roughly equidistant from the Ross N. Robinson and Andrew Johnson sites.

3.0 Approved Implementation Plan

EPA's 2014 SO_2 SIP guidance states that the SIP for the affected area would need to be fully approved under CAA §110(k) and satisfy all applicable requirements for the area. An area cannot be redesignated to attainment if a required element of its plan is the subject of a disapproval; a finding of failure to submit, or failure to implement the SIP; or a partial, conditional, or limited approval. However, the approval action on both SIP elements and the redesignation request may occur simultaneously.

On February 9, 2023, the Tennessee Department of Environment and Conservation's Division of Air Pollution Control submitted an Attainment Demonstration showing that the area would attain the NAAQS by the attainment date of April 5, 2027. The Attainment Demonstration also met the other requirements of CAA §110(a), 172, 191, and 192. Specifically, the Attainment Demonstration contained a base year inventory for 2017, a projected attainment year inventory for 2027, a modeled attainment demonstration, provisions for RACT/RACM, NSR, RFP, and contingency measures. Tennessee's Attainment Demonstration is not subject to a disapproval, limited, or conditional approval or a finding of failure to submit.

4.0 Permanent and Enforceable Reductions

A redesignation request must demonstrate that the improvement in air quality is due to permanent and enforceable reductions in emissions resulting from implementation of the applicable implementation plan and applicable Federal air pollutant control regulations and other permanent and enforceable reductions. Permanent and enforceable emission reductions should be a result of emission limitations in the SIP for sources in the nonattainment area or at outside sources contributing to violations in the nonattainment area. Attainment resulting from temporary reductions, such as reduced production rates, shutdowns due to adverse economic conditions, or favorable meteorology, would not qualify as permanent and enforceable with respect to air quality improvements. In making this demonstration, EPA recommends that states provide sufficient quantitative information about emission reductions achieved by relevant controls to demonstrate that the improvement in air quality is attributed to permanent and enforceable measures.

Table 4-1 shows the change in SO_2 emissions from Eastman's coal-fired boilers (**Figure 4-1**) between 2011 and 2022. This table shows historic emission rates from a base year (2011) used to determine the original design value for designation, an interim year (2017) that reflects partial implementation of the control strategy (repowering of three of Eastman's B-253 boilers from coal to natural gas operation), and a final year (2022) showing full implementation of the control strategy (conversion of all five B-253 boilers from coal to natural gas operation and installation of dry sorbent injection on B-83 boilers 23 and 24).

Table 4-1: Eastman Chemical Company Actual Emissions – Coal-Fired Boilers

Release Point ID	Description	SO_2 Emissions (tons)			% Change, 2011-2022
		2011	2017	2022	
B-253-1	B-253 Coal-Fired Boilers	14,897	4,779	7.37	(99.95%)
B-83-1	B-83 Coal-Fired Boilers	5,686	4,447	2,227	(60.8%)
B-325-1	B-325 Coal-Fired Boilers	1,276	1,340	1,100	(13.8%)
Totals:		**21,859**	**10,566**	**3,334**	**(84.7%)**

Overall, boiler emissions decreased by 84.7% between 2011 and 2022 as a result of Eastman's control strategy, which consisted of the following permanent and enforceable measures.

Figure 4-1: Eastman Chemical Company Powerhouses

4.1 Control Measures for Point Sources

Repowering of Boilers 25-29: Tennessee adopted Regional Haze SIPs on March 31, 2008, and May 9, 2012, to establish Best Available Retrofit Technology (BART) requirements for SO_2 emissions from Boilers 25-29 at Eastman Chemical Company's B-253 Powerhouse. The Regional Haze SIP required these boilers to comply with an SO_2 limit of 0.20 lb/MMBtu or to reduce uncontrolled SO_2 emissions by 92%, and an Alternative BART option allowed Eastman to repower these boilers from coal to natural gas operation as an alternative to add-on controls. A PSD construction permit (966859F), which authorized construction for the boiler repowering, was issued June 5, 2013, and Condition 6 of that permit states that on and after the startup date of each modified boiler in the B-253 fuel-burning installation, only natural gas shall be used as fuel. The repowered boilers began operation on the dates shown in **Table 4-2**, and conversion of the five B-253 boilers from coal to natural gas operation reduced SO_2 emissions from B-253 by >99.9% (from 14,897 tons/year to 10 tons/year). Tennessee requests that EPA approve a fuel usage restriction for Boilers 25 through 29 (only natural gas may be used as fuel for this source) into the SIP[31] as a permanent and enforceable control measure for Boilers 25-29.

[31] See Condition 6 of PSD Construction Permit 966859F. Compliance with this restriction is based on design and construction of the modified source (i. e., separate natural gas lines and burners have been installed in the boilers, and the associated coal handling equipment has been removed or abandoned in place). The separate natural gas lines and burners physically restrict the boilers' ability to combust other fuels, including coal and fuel oil.

Table 4-2: Startup Dates of Modified B-253 Boilers	
Boiler	**Startup Date**
25	April 23, 2014
27	April 23, 2016
28	October 2, 2016
29	March 30, 2018
26	October 4, 2018

Dry Sorbent Injection for B-83 Boilers 23 and 24: The initial failure to attain the NAAQS in 2019 triggered the contingency plan requirements of the 2017 attainment demonstration, including the requirement to develop and implement operational changes as necessary to prevent future monitored violations of the standard. In response to the monitored exceedances, Eastman installed a portable dry sorbent injection (DSI) system on B-83 Boilers 23 and 24 and began the development of a plan to install a permanent DSI system. Eastman selected this provisional emission control strategy because the B-83 Boilers 18 through 24 were uncontrolled[32] and because Boilers 23 and 24 are high pressure baseload boilers that are operated preferentially over pressure Boilers 18 through 22, which are smaller and operate at lower pressure. Eastman designed the permanent DSI system to use sodium bicarbonate as the sorbent and to operate with a nominal control efficiency of 60%[33]. Installation and startup of the permanent DSI were completed in 2021, and these measures were made permanent and enforceable with the issuance of SIP permit 080222 on March 1, 2023[34].

Combined Emission Limits for B-83 Powerhouse (Boilers 18-24) and B-325 Powerhouse (Boilers 30-31): To assure that emissions from the B-83 and B-325 boilers do not endanger future attainment, air quality modeling was used to establish an emission limit of 1,248 lb/hr for all coal-fired boilers at Eastman's Kingsport facility. The modeled values were converted to a single 30-day rolling average emission limit (combined total for all coal boilers) using the procedure discussed in EPA's SO_2 SIP guidance, and compliance with this limit is demonstrated through the use of continuous emissions monitoring systems (CEMS) on all boilers[35]. Compliance with these limits is based upon the operation of existing controls for B-325 (spray dryer absorbers with PM control devices) and dry sorbent injection controls for B-83 Boilers 23 and 24. All 30-day rolling averages must be calculated as specified in 40 CFR §63.10021(b) (**Equation 4-1**), where Her_i is the hourly emissions rate for hour i (combined total emissions for all boilers) and n is the number of hourly emissions rate values collected over 30 boiler operating days[36].

[32] Eastman also considered that the coal boilers Eastman's B-325 powerhouse are already well-controlled: Boiler 30 uses a spray dryer absorber and electrostatic precipitator (ESP) that reduce SO_2 by about 65%, and Boiler 31 uses a highly efficient spray dryer absorber and fabric filter system to reduce SO_2 emissions by 90-95%.

[33] The nominal control efficiency of the permanent DSI is higher than the efficiency of the portable system that was operated between 2019 and 2021. The portable system consisted of a single train serving two boilers, whereas the permanent system consists of one train for each boiler plus a spare train. The permanent DSI includes a dehumidifier to reduce plugging incidents on each train.

[34] SIP permit 082237, which is included with this redesignation request, incorporates the emission limits and monitoring requirements of permit 080222 for most sources and adds periodic reporting requirements.

[35] All boilers are equipped with CEMS, but emissions from the larger boilers (23, 24, 30, and 31) are calculated differently from Boilers 18 through 22. Boilers 23, 24, 30, and 31 are subject to the NO_X SIP Call and are required by 40 CFR 75 to install and operate in-stack flow monitors. Because Boilers 18 through 22 are not equipped with flow monitors, SO_2 emissions are calculated in lb/MMBtu using 40 CFR 60 Appendix A, Method 19 and the heat input is calculated from the energy rise of steam across the boiler.

[36] "Boiler operating day" means a 24-hour period that begins at midnight and ends the following midnight during which any fuel is combusted at any time in any of the boilers. It is not necessary for the fuel to be combusted the entire 24-hour period.

$$Boiler\ operating\ day\ average = \frac{\sum_{i=1}^{n} Her_i}{n}$$ **Equation 4-1**

Permit 082237 requires each CEMS to be fully operational for at least 95% of the operational time of the monitored boiler during any calendar quarter, and missing data must be addressed by substituting the higher value of: (1) the last valid hourly emission rate before, or (2) the first valid hourly emission rate after, the period of missing data.

4.3 Other Controls

Tennessee is requesting that EPA adopt into the SIP the limits and associated compliance parameters listed in **Table 4-4,** established in the enforceable permits referenced in the table, and provided in Attachment J. These measures have resulted in permanent reductions in SO_2 emissions from Eastman's boilers and hazardous waste incinerators, as follows:

- B-253 boiler emissions decreased from 14,897 tons/year in 2011 (all boilers burning coal) to 4,779 tons/year in 2017 (includes both coal and gas boilers) and 7.37 tons/year in 2022 (all boilers converted to gas operation).

- B-83 Boiler decreased from 5,686 tons/year in 2011 to 4,447 tons/year in 2017 and 2,227 tons/year in 2022.

- SO_2 emissions from the solid/liquid chemical waste incinerators (PES B-248-1) decreased from 6.5 tons/year in 2011 and 11.7 tons/year in 2017 to 3.44 tons/year in 2022.

- SO_2 emissions from the liquid chemical waste incinerator (PES B-248-2) decreased from 0.8 tons/year in 2011 and 2.96 tons/year in 2017 to 0.46 tons/year in 2022. The decreased in emissions from Eastman's incinerators were primarily the result of the sale of Eastman's adhesive resins business (the source of sulfur-containing waste in the incinerator feed) in 2022, and the emissions limits will ensure that SO_2 emissions from the incinerators do not interfere with the attainment or maintenance of the SO_2 NAAQS in the future.

SIP permit 079592 was issued on February 9, 2022 to address the reasonable progress requirements for the second planning period of Tennessee's long-term strategy for Regional Haze. Condition 1 of this permit limits combined SO_2 emissions from Boilers 23 and 24 to 1,396 tons during any period of 12 consecutive months, beginning on March 1, 2022. Tennessee is noting these controls in the request as additional weight of evidence, but attainment of the NAAQS does not depend upon these controls, and we are not requesting adoption of these limits into the SIP for purposes of redesignation.

4.4 Future Controls

SIP permit 079592 requires the shutdown of B-83 Boilers 18, 19, and 20 no later than December 31, 2028. This change will help to ensure continued attainment of the NAAQS in the future, but Tennessee's air quality modeling did not include the B-83 shutdowns, and Tennessee is not relying upon these reductions for current or future attainment.

4.5 Recordkeeping and Reporting

SIP permit 082237 establishes general recordkeeping for all emission sources included in the permit. The permit also requires each source to submit periodic reports of SO_2 emissions, including reporting of all instances of deviations from the permit requirements[37]. For Primester, Condition E5-1 of permit 574994 includes the following monitoring requirements:

> *A minimum scrubber flow rate of 1.0 gallons per minute (3-hour moving average) and a minimum scrubber pH of 6.0 (24-hour block average) shall be maintained for Scrubber SRC-23. The scrubber flow rate and pH shall be continuously monitored and recorded.*

Primester's general recordkeeping requirements are included in Tennessee's Title V regulations (TAPCR 1200-03-09-.02(11)(e)1(iii)(II)II) and Condition B2 of permit 574994, which require the permittee to retain records of all required monitoring data and support information[38] for a period of at least five years from the date of the monitoring sample, measurement, report, or application. Primester is also required to submit periodic (i. e., semiannual) reports pursuant to Tennessee's Title V regulations (TAPCR 1200-03-09-.02(11)(e)1.(iii)) and Condition E2-1 of permit 574994. This condition requires Primester to submit reports of the monitoring and recordkeeping requirements included in the permit, including the requirements established by Condition E5-1, and a report of all deviations identified during the reporting period.

For Eastman's sludge recovery operations (B-55-1), permit 082237 establishes additional monitoring requirements, as follows:

- Vent B represents the vent stack associated with four batch reactors that react sludge (distillation column bottoms and off-quality product) with sulfuric acid to liberate organic acids for downstream reuse. SO_2 emissions are generated as a by-product of the reaction and are variable over time during the batch cycle. Eastman reported that the typical shape of the emissions curve is a period of negligible SO_2 emissions at the start of each batch cycle followed by a period of linear SO_2 generation from an inflection point to the end of the batch cycle. A water scrubber is used to control organic acid emissions from the batch reactors, but no SO_2 control is assumed from the scrubber, and post-control SO_2 emissions are assumed to be identical to pre-control emissions. Eastman proposes to add stack testing ports to one reactor[39] and to collect reference method test data every 15 minutes over the entire batch cycle. The test data will be used to generate an emissions curve that will be used to estimate the SO_2 emission rate in pounds per hour for subsequent batch cycles.

- Vent C represents the vent stack associated with the vacuum system (pump) that is used to remove liquids from the material on the sludge handling belt. SO_2 emissions are generated as a by-product of continuing reactions occurring in the liquid material or by liberation of SO_2 that is entrained in the liquid as vacuum is applied to the system. A water scrubber is used in the system to control acid emissions, but no control of SO_2 is expected from the water scrubber. Eastman proposes to collect grab samples at varying belt processing rates to determine the value of testing over multiple belt processing rates compared to a single test at the maximum belt processing rate. If the emissions rate

[37] Deviation reports shall include a description of the deviation; the duration of the event; the explanation or probable cause; and identification of corrective actions or preventative measures undertaken to correct the deviation.
[38] Support information includes all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, and copies of all reports required by the permit.
[39] The reactors are identical in size and operation, so a single reactor is representative of the larger process. The location of the stack test ports will be in the reactor vent header system prior to the inlet of the water scrubber.

is not highly variable with belt processing rate, a single test at the maximum belt processing rate will be performed. Once the specific feed rate level(s) are determined, reference method test data collected over three one-hour runs at each belt processing rate will be used to generate a maximum SO_2 emissions rate (lb/hr) that will be used during all periods of sludge handling belt operation. Stack test ports will be installed in the vent piping following the vacuum pump that is located on the outlet vent of the water scrubber.

- Vent E represents the vent stack associated with the vacuum system (steam jet) that is used to reduce the pressure in an evaporator and a flash chamber. No emissions control system is associated with this equipment. The evaporator is fed liquid material from the underflow of the first sections of the sludge handling belt, and recovered sulfuric acid is returned to the batch reactors as raw material. The flash chamber receives and returns (circulation loop) material to/from the hold-up tank that precedes the sludge handling belt. This operation is periodically performed to reduce liquids in processed sludge material and perform cooling of the sludge prior to being fed to the sludge handling belt. SO_2 emissions are generated as a by-product of continuing reactions occurring in the liquid material or liberation of entrained SO_2 in the liquid as vacuum is applied to the system. The equipment associated with Vent E is currently out of service and requires capital expenditure to return the process to operation, but Eastman wants to reserve the ability to operate the equipment in the future. If this equipment is restored to working order, Eastman will revaluate the emissions from Vent E via reference method testing within 180 days of startup. SO_2 emissions from this source are estimated at 0.0003 lb/hr based on bag sampling, and if this source resumes operation, Eastman will use the current estimate of 0.0003 lb/hr prior to completion of a performance test.

- Vent I represents the vent stack associated with a water scrubber that is used to control organic acid emissions from the sludge handling belt. Processed material from the batch reactors is transferred to a hold-up tank (Vent K) prior to being continuously fed to a porous, rotating belt that separates desired liquid material from unreacted solid waste. A hood and blower system is located over the belt and pulls vapors into the scrubber vent header system continuously. SO_2 emissions are generated as a by-product of continuing reactions occurring in the material on the belt and liberation of SO_2 entrained in the material from the reactors. No control of SO_2 is assumed from the water scrubber and emissions of SO_2 evaluated before the scrubber are assumed to be the emissions after the scrubber. Grab samples at varying belt processing rates will be used to determine the value of emissions testing over multiple belt processing rates vs. a singular maximum belt processing rate. If the emissions rate is not highly variable with belt processing rate, a single test at the maximum belt processing rate will be performed. Once the specific feed rate level(s) are determined, reference method test data collected over three one-hour runs at each belt processing rate will be used to generate a maximum lb/hr SO_2 emissions rate that will be used during all periods of sludge handling belt operation. Location of the stack test ports will be in the outlet vent piping of the of the water scrubber.

- Vent K represents the vent stack associated with a water scrubber that is used to control acid emissions from 20 process tanks and storage tanks in the B-55 operating area, including four tanks associated with sludge recovery operations. No control of SO_2 is assumed from the water scrubber and SO_2 emissions evaluated before the scrubber are assumed to be the emissions after the scrubber. Reference method test data collected over three one-hour runs will be used to generate a maximum emission rate that will be used during all periods of operation (i.e., when material is stored in any tank associated with sludge recovery).

For all B-55 vents, data will be evaluated, and an emissions curve will be generated. The batch emissions curve will be re-evaluated within 180 days after any process change that would increase SO_2 emissions or at least once every 60-months.

All periodic reports are available online and are accessible for public viewing at the TDEC Division of Air Pollution Control's Permits and Inspections Data Viewer (see https://www.tn.gov/environment/about-tdec/tdec-dataviewers.html).

Table 4-4: Other Emission Limits Included in the SIP				
Permit	**Condition(s)**	**Affected Source**	**Limit/Control Measure**	**Associated Monitoring**
PSD Construction Permit 966859F	6	PES B-253-1 Boilers 25 through 29 (82-0003-01, MSOP-02)	Only natural gas shall be used as fuel	None specified. Compliance with the fuel usage restriction is based on the design and construction of the boiler (natural gas feed lines and burners physically restrict the source's ability to burn other fuels).
SIP Operating Permit 082237	S1-1 through S1-3	PES B-83 Boilers 18 through 24 (82-0003-01, MSOP-02) and PES B-325 Boilers 30 and 31 (82-0003-131, MSOP-26)	1,248 lb/hr (30-day average, combined limit for all boilers) and associated monitoring	Operate, maintain, and repair a dry sorbent injection (DSI) system to reduce SO_2 emissions from B-83 Boilers 23 and 24 as required to maintain and assure compliance with the specified emission limits. Calculate hourly emissions SO_2 emissions from CEMS data and flow monitoring (B-83 Boilers 23 and 24 and B-325 Boilers 30 and 31) or from CEMS data and calculated heat input (B-83 Boilers 18 through 22).
	S5-1 and S5-2	B-248-1 Solid/Liquid Chemical Waste Incinerators (82-0003-282, MSOP-32)	15.2 lb/hr (30-day average, combined limit for both rotary kilns) and associated monitoring	Calculate hourly emissions from sulfur feed rate and scrubber pH using established algorithm. Continuously monitor scrubber pH and determine the waste stream sulfur concentrations from analysis or process knowledge.
	S6-1 and S6-2	B-248-2 Liquid Chemical Waste Incinerator (82-0003-283, MSOP-32)	2.0 lb/hr (30-day average) and associated monitoring	
	S2-1 and S2-2	B-334-1, Incinerator for Acid Gas Removal and Sulfur Recovery Plant (82-0003-168, MSOP-17)	21.8 lb/hr (24-hour block average) and associated monitoring	Continuously measure the gas composition and gas flow rate in the SCOT process overhead stream entering the tail gas incinerator and use the monitored parameters to calculate the SO_2 emission rate.
	S4-1 and S4-2	B-55-1, Organic Acids & Anhydrides Manufacturing, Vents B, C, E, I, and K (82-0003-224, MSOP-23)	6.74 lb/hr and associated monitoring	Periodic stack testing.
	S3-1 and S3-2	PES B-351-5, Coal Gasification Cold and Warm Flares (82-0003-171, MSOP-17)	16.28 lb/hr (30 calendar day rolling average basis) and associated monitoring.	Continuously measure the gas composition and gas flow rate entering the flare and use the monitored parameters to calculate the SO_2 emission rate.
PSD permit 955272F	4	PES B-325-1, Boiler 30	317 lb/hr (30 calendar day rolling average basis) and associated monitoring.	Calculate hourly SO_2 emissions from CEMS data and flow monitoring, as required by permit 082237.
		PES B-325-1, Boiler 31	293 lb/hr (30 calendar day rolling average basis) and associated monitoring.	
Title V Operating Permit 574994 (Primester)	E5-1	82-0510-03, B-441-2, Vent C	1,000 parts per million by volume, dry basis (one hour average) and 0.25 pounds per hour (three-hour average)	Compliance is based upon parametric monitoring of the minimum scrubber flow rate (three-hour moving average of 1.0 gallons/minute) and minimum scrubber pH (24-hour block average value of 6.0).

5.0 Applicable Requirements Under Section 110 and Part D

For the purposes of redesignation, a state must meet all requirements of CAA §110 and Part D that were applicable prior to submittal of a complete redesignation request. This condition does not include requirements that come due after the submittal of a complete redesignation request, but any requirements that came due prior to submittal of the request must be fully approved at or before the time that EPA redesignates the area. The Calcagni memo also states that under CAA §175A(c), the requirements of Part D remain in force and effect for the area until such time as it is redesignated. Upon redesignation to attainment, the requirements that became due under §175A(c) after submittal of the complete redesignation request would no longer be applicable.

5.1 Section 110 Requirements

Section 110(a)(2) contains general requirements for nonattainment plans, and pursuant to CAA §110(a)(1), states are required to submit SIPs meeting the applicable requirements of CAA §110(a)(2) within three years after promulgation of a new or revised NAAQS. States were required to submit such SIPs for the 2010 1-hour SO_2 NAAQS to EPA no later than June 2, 2013. Tennessee submitted an infrastructure SIP on March 13, 2014, and EPA approved the SIP, with the exception of the interstate transport requirements of CAA §110(a)(2)(D)(i)(I) and (II) on November 28, 2016[40]. EPA approved the visibility requirements of §110(a)(2)(D)(i)(II) on September 24, 2018[41], and the remaining elements of §110(a)(2)(D)(i) on August 9, 2023[42]. These approvals address all of the infrastructure elements except for CAA §110(a)(2)(I) (plan revisions for nonattainment areas), and those requirements are addressed in the following section.

5.2 Part D Requirements

Part D of the Clean Air Act (Plan Requirements for Nonattainment Areas, CAA §§171-193) addresses the general requirements for nonattainment areas. Specific statutory requirements include the requirement for an accurate emissions inventory for all sources of SO_2 within the nonattainment area (point, area, and mobile sources); a New Source Review (NSR) permit program; and an attainment demonstration using an EPA approved air quality dispersion model. The SIP submittal must also provide for: Reasonable Further Progress (RFP); implementation of RACM including RACT, and adequate contingency measures for the affected area. These elements are briefly described below.

5.2.1. Emissions Inventory

To demonstrate continued maintenance; the air agency should develop an attainment inventory to identify the level of emissions in the affected area which is sufficient to attain and maintain the SO_2 NAAQS. This inventory should be consistent with the EPA's most recent guidance on emission inventories for nonattainment areas available at the time and should include the emissions during the time period associated with the monitoring or modeling data showing attainment.

The last NAAQS exceedance occurred in 2021, and the first three-year period for which the design value fell below the NAAQS is 2020-2022. Repowering of B-253 boilers 25 through 29 from coal to natural gas was

[40] See 81 FR 85410.
[41] See 83 FR 48240.
[42] See 88 FR 53801.

completed by October 2018, and installation of DSI controls on B-83 Boilers 23 and 24 was completed in November 2021. The starting point for the 2022 point source emission inventory was the 2022 National Emissions Inventory (NEI), and the 2022 data was supplemented with information submitted by the affected facilities.

5.2.1.1 Point Sources

The largest point source located within the nonattainment area is Eastman Chemical Company's Tennessee Operations facility and the 2022 actual emissions for this facility are summarized in Attachment A of the redesignation request. Eastman's coal-fired boilers were responsible for nearly all SO_2 emissions from this facility (~98-99%), as indicated in **Table 5-1**. Table 5-1 also shows that Eastman's SO_2 emissions have declined substantially following implementation of the control strategy.

Table 5-1: Summary of Historical SO_2 Emissions

	2011[43]	2017[44]	2022
Facility-Wide SO_2 emissions (tons)	22,024	10,566	3,334
Coal-fired Boiler SO_2 emissions (tons)	21,859	10,567	3,326
Coal-Fired Boiler % of Total SO_2 Emissions	99.5%	99.5%	98.5%

Primester GP operates a cellulose acetate manufacturing process at 1801 Warrick Drive (adjacent to Eastman Chemical Company). This facility is regulated by Title V Operating Permit 574994 (issued January 1, 2020). This facility includes one SO_2 emission source (Cellulose Scrap Recovery Process). Reject dope from various points in the acetylation operation is processed for the recovery of cellulose sludge, and recovered materials are distilled for reuse. Once the recoverable materials are removed from the cellulose sludge, it is heated with sulfuric acid in pressurized reactors to degrade the sludge into smaller solids for offsite management. Sulfur dioxide is emitted from the equipment and conveyors at this source, and SO_2 emissions are controlled by a wet scrubber. Primester is not subject to the annual or triennial air emissions reporting requirements established pursuant to 40 CFR 51 Subpart A. For purposes of redesignation, actual emissions from this source were assumed to be equivalent to the SIP emission limit of 0.25 lb/hr (1.1 tons/year)[45].

In general, states may generally demonstrate maintenance of a NAAQS either by showing that future emissions will not exceed the level of the attainment year inventory (2022 in Tennessee's redesignation request), or by modeling to show that the future mix of sources and emission rates will not cause a violation of the NAAQS. Tennessee has elected to demonstrate maintenance using a modeled attainment demonstration, and the 2037 inventory reflects the expected growth in point source emissions during the ten-year maintenance period. The 2037 point source inventory projects 7,337 tons of SO_2 emissions from Eastman Chemical Company, which reflects the use of allowable emissions for the B-83 and B-325 boilers, hazardous waste incinerators (PES B-248-1 and B-248-2), and the acid gas and sulfur recovery plant incinerator (PES B-334-1). The maintenance year inventory also reflects the addition of three natural gas boilers and a proposed methanolysis plant.

[43] Base year inventory in Tennessee's May 11, 2017, Attainment Demonstration.
[44] Base year inventory in Tennessee's February 9, 2022, Attainment Demonstration.
[45] The 2022 emissions estimate is higher than the 2017 value in the attainment demonstration, which was calculated as 0.57 tons based on production data submitted by Primester.

As noted previously, Primester GP is not subject to the annual or triennial air emissions reporting requirements, and future emissions from this source were assumed to be equivalent to the SIP emission limit of 0.25 lb/hr (1.1 tons/year).

Tennessee also reviewed SO_2 emissions from sources located outside of the nonattainment area (Domtar Paper Company and Holston Army Ammunition Plant Area B Operations) that could impact ambient SO_2 concentrations within the nonattainment area (**Table 5-2**). PSD construction permit 978656 was issued to Domtar June 21, 2021, to convert the idled mill from a hardwood bleached soda process to produce containerboard from 100% recycled material. This project included the optimization of a bubbling fluidized bed boiler, convert the existing soda recovery furnace to combust natural gas, and to shut down the existing lime kiln. Domtar's updated allowable emissions were included in the modeled attainment demonstration to ensure that the facility did not substantially impact the nonattainment area, but the changes associated with this modification are not part of the area's demonstration of maintenance for the 2010 SO_2 NAAQS. Holston Army Ammunition Plant's Area B facility is located in Hawkins County and included four coal-fired boilers during the base year. PSD construction permit 974192 was issued to BAE Systems Ordnance Systems Inc. (operating contractor for Holston Army Ammunition Plant) on October 8, 2018, for the construction of four natural gas and #2 oil-fired boilers to replace the facility's coal units. These boilers last operated on October 1, 2021, and BAE submitted formal notification of the retirement of these boilers on November 1, 2021. Base year SO_2 emissions from Holston Army Ammunition Plant's remaining emission sources were less than 0.5 tons/year.

Table 5-2: Domtar Paper Company and Holston Army Ammunition Plant

Facility	2017 SO_2 Emissions (tons)
Domtar Paper Company	45.16
Holston Army Ammunition Plant	1,768

Tennessee did not include Holston Army Ammunition Plant or Domtar in the 2022 and 2037 emission inventories because both facilities are located outside of the nonattainment area, and Domtar's modeled emissions did not significantly impact the nonattainment area. Holston Army Ammunition Plant retired their coal-fired boilers in 2021, and SO_2 emissions from other sources at that facility are negligible.

Point source emissions for 2022 and 2037 are summarized in **Table 5-3**. State plans may generally demonstrate that the plan will provide for maintenance of the NAAQS by either showing that future emissions will not exceed the level of the attainment inventory, or by modeling to show that the future mix of sources and emission rates will not cause a violation of the NAAQS. The 2037 point source emissions are higher than the base year because Tennessee developed the projection using the same ambient air quality modeling used to demonstrate attainment of the NAAQS. For example, the model accounts for expected growth at Eastman Chemical Company during the 10-year maintenance period (i.e., the construction and startup of three new natural gas-fired boilers and the methanolysis plant). The model also assumes that the remaining coal-fired boilers (B-83 and B-325 powerhouses) continuously operate at their maximum allowable hourly emission rate for the entire year, while the base year inventory is representative of actual boiler operation at submaximal emission rates. Finally, the future year inventory does not consider reductions that were not relied upon to demonstrate attainment and maintenance of the NAAQS, such as the requirement to shut down B-83 Boilers 18, 19, and 20 for compliance with Tennessee's Regional Haze SIP. To summarize,

the future year inventory includes a mix of operational changes and projected growth at Eastman that is accounted for the in the air quality modeling and that, notwithstanding the higher annual emissions, will not cause or contribute to a NAAQS violation.

Table 5-3: Summary of Point Source Emissions		
	SO_2 Emissions (tons)	
Description	**2022**	**2037**
Eastman Chemical Company	3,367	7,337
Primester GP	1.1	1.1
Totals	**3,368.1**	**7,339.1**

5.2.1.2 Area Sources

Attainment year emissions were projected for 2022 using emission data sets and information used by U. S. EPA to develop the 2016v1 and 2016v2 emissions inventories[46,47]. For most source classification codes, Tennessee calculated a growth factor as the difference between 2026 and 2016 emissions, as follows:

Growth factor = (2026 emissions – 2016 emissions)/10

For each year between 2017 and 2022, future year emissions were calculated by adding the growth factor to the base year (2016) and to each subsequent year. The final result (2022 emissions) was used for the attainment year emission inventory.

For source classification codes 2610000400 (Open Burning - Yard Waste – Brush) and 2610000500 (Open Burning - Land Clearing Debris), the growth factor calculated above did not produce a realistic number because the calculated growth factor (-0.09164187 tons/year for open burning of yard waste/brush and -27.15637 tons/year for open burning of land clearing debris) produced negative values in 2037 (i. e., the model predicted that emissions from each category would be less than zero). For these source categories, Tennessee estimated 2022 and 2037 mobile source emissions by interpolation (for 2022) and extrapolation (for 2037) of the existing data by assuming a constant rate of year-over-year change (i. e., by assuming emissions decrease by a constant percentage of the previous year's emissions rather than a constant tonnage)[48]. This method assumes that the rate of change is logarithmic rather than linear (**Figures 5-1 and 5-2**), so that open burning emissions approach a minimum value over time without reaching zero. Using the 2016 base year as an initial condition and 2026 as a checkpoint, the year-over-year change was numerically determined (i. e., an initial

[46] The 2016v1 inventory is available online at https://www.epa.gov/air-emissions-modeling/2016v1-platform. The CSV file containing the area source inventory (2016fh_proj_from_2014NEIv2_NONPOINT_final_20180119_08aug2019_nf_v1.csv) is available at https://gaftp.epa.gov/Air/emismod/2016/v1/2016emissions/2016fh_inventory_nonpoint_27sep2019.zip.

[47] The 2016v2 inventory is available online at https://www.epa.gov/air-emissions-modeling/2016v2-platform. The CSV file containing the area source inventory (MYR_nonpt_constant_2017NEI_NONPOINT_20200415_28sep2020_v1.csv) is available at https://gaftp.epa.gov/Air/emismod/2016/v2/2016emissions/2016fj_nonpoint_inventoryt_15sep2021.zip.

[48] Since two data points (2017 and 2027) are known, Tennessee considered whether to estimate 2022 and 2032 by assuming a linear relationship for all years and calculating a constant year-over year change in tons/year. Using that method, the average change in emissions would be (2027 emissions – 2017 emissions)/10, and 2022 emissions would be equal to (2017 emissions) + (change in emissions)(5 years). The problem with this method is that applying a constant tons/year decrease will eventually reach zero, and projected mobile source emissions would become negative by 2032. Therefore, this method was considered inadequate for projection of future emissions. In contrast, a constant ***rate of change*** requires that that the absolute value of the decrease will become smaller over time.

estimate was adjusted up or down in small increments) until the projected 2026 emissions matched the value of EPA's 2026 inventory. Using a year-over-year change of 8.758225% (open burning of land clearing debris) and 9.000% (open burning of yard waste), source category emissions for each year between 2017 and 2037 were determined in accordance with **Equation 5-1**.

Current year emissions = (previous year emissions)(1- year-to-year change) **Equation 5-1**

County-level emissions were apportioned to the nonattainment area by using a percentage (9.3%) derived from the 2010 Census Bureau Population data for the county and the population for the nonattainment area[49].

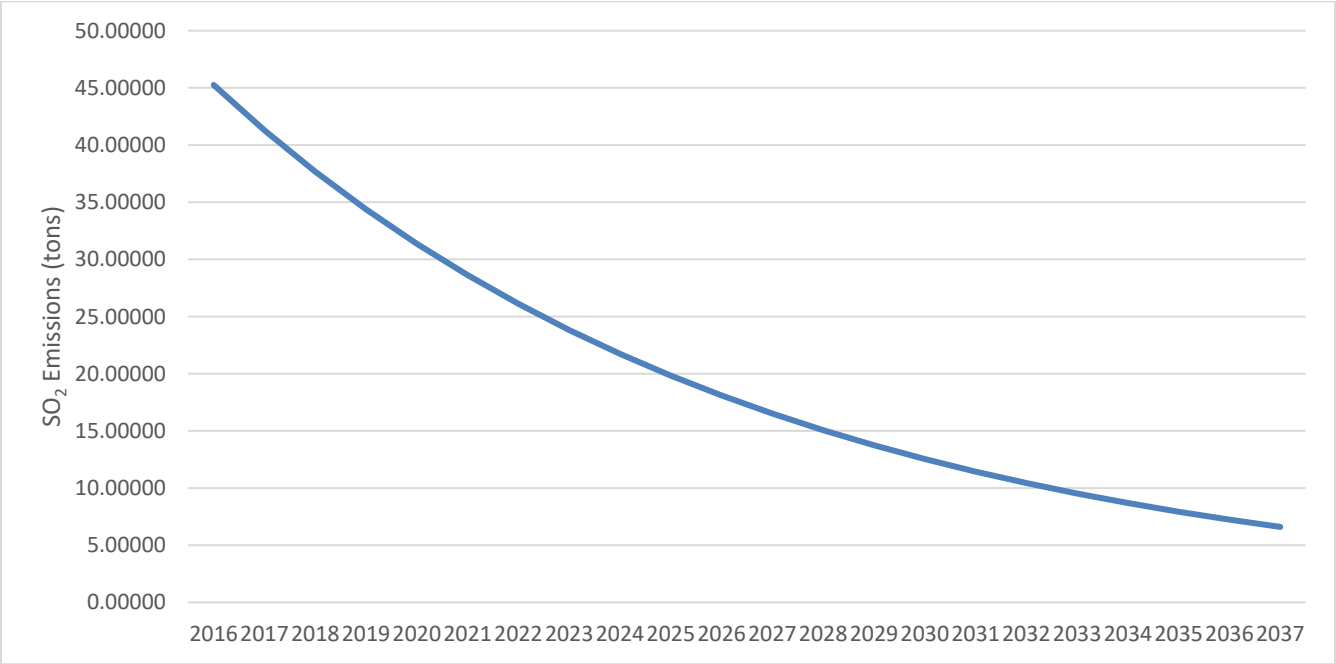

Figure 5-1: Projection of Area Source Emissions from Open Burning of Land Clearing Debris

[49] The allocation of nonpoint source emissions by population should not significantly overcount or undercount emissions relative to the county as a whole, because these emissions should vary directly with population (i. e., a population-weighted allocation of emissions from the entire county to the nonattainment area should be representative of the nonattainment area). Tennessee also believes that any overcounting or undercounting should have a negligible impact on the emission inventory as a whole, because these emissions are a small fraction of the overall emissions.

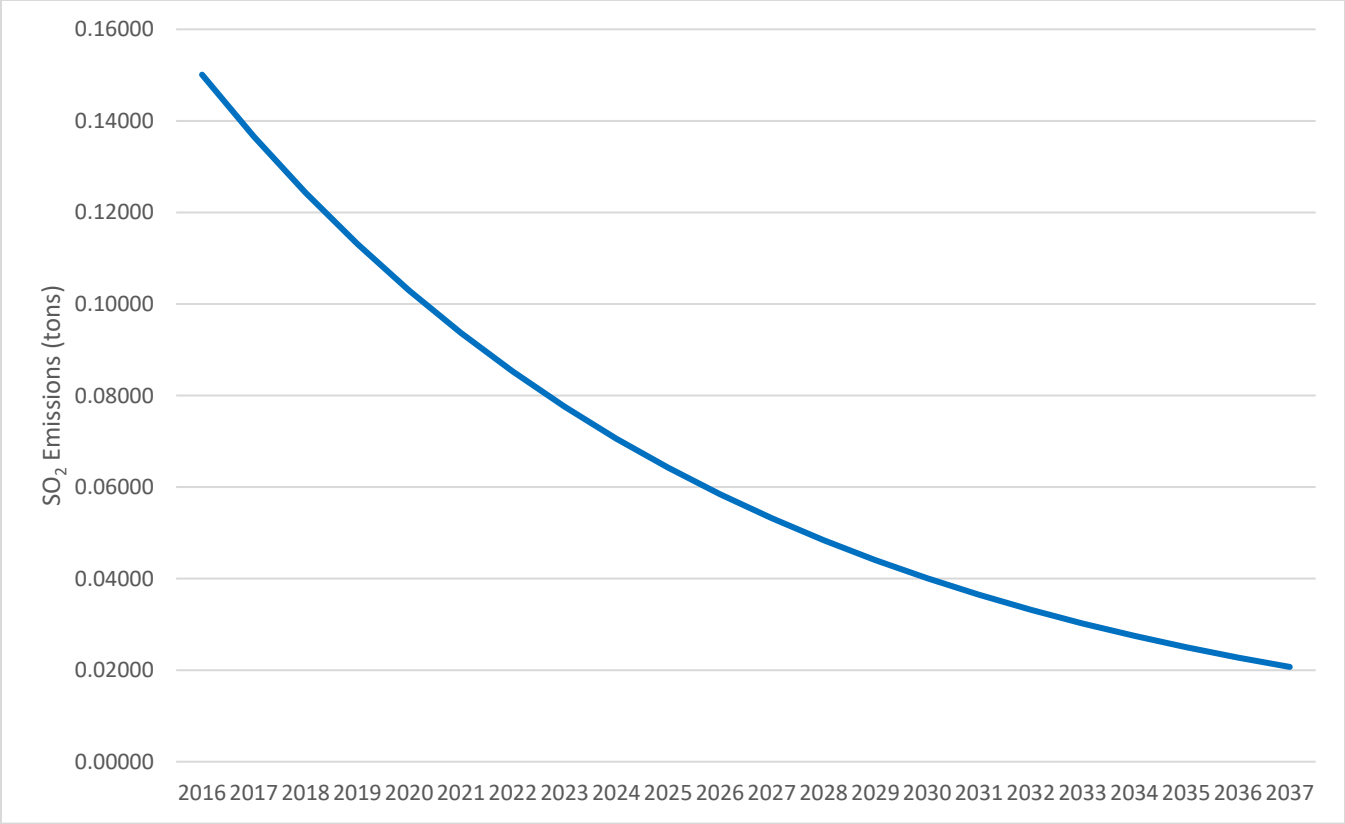

Figure 5-2: Projection of Area Source Emissions from Open Burning of Yard Waste/Brush

Area source emissions of SO_2 for 2022 and 2037 are summarized in **Table 5-5** and included in Attachment B.

Table 5-5: Area Source SO_2 Emissions – Sullivan County Nonattainment Area	
Year	**SO_2 (tons)**
2022	4.22[50]
2037	3.42

5.2.1.3 Onroad Mobile Sources

Onroad mobile sources include emissions from motorized vehicles that are normally operated on public roadways, including passenger cars, motorcycles, minivans, sport-utility vehicles, light-duty trucks, heavy-duty trucks, and buses. The sector includes emissions generated from parking areas and "hoteling" emissions from the idling of long-haul diesel trucks during federally mandated rest periods. Emissions from onroad sources are estimated through the use of locally gathered information on the vehicle population and the miles driven

[50] The area source inventory for 2022 is higher than the base year inventory for 2017 (3.31 tons) and the 2027 projected inventory (3.39 tons) that were submitted with the 2023 attainment demonstration because the 2022 area source inventory includes higher estimated emissions from open burning to clear land debris. EPA's 2016 projection that was used as the starting point indicated 45.25 tons of SO_2 from open burning in 2016 and 18.10 tons of SO_2 in 2027 for the same category. Tennessee remains skeptical of this value because EPA's 2016 and 2027 estimates indicate that open burning of yard waste is substantially lower (0.15 tons in 2016 and 0.06 tons in 2017) for all of Sullivan County. When the nonattainment area is considered by itself, there is very little land for which open burning would be feasible to remove trees and other vegetation.

in the area, as well as a number of other inputs, combined with EPA's Motor Vehicle Emissions Simulator (MOVES) model.

Federal standards for National Low Emission Vehicles (NLEV) began in 1999 and were implemented through 2001 for new light duty cars and trucks, and EPA has since implemented further reductions from onroad mobile sources via Tier 2 and Tier 3 vehicle emission standards[51, 52]. Most gasoline sold in Tennessee prior to January 2006 had a sulfur content of up to 300 ppm, and the Tier 2 rule reduced the allowable sulfur content of gasoline to 30 ppm starting in January of 2006. Sulfur occurs naturally in gasoline but interferes with the operation of catalytic converters, and lower-sulfur gasoline is necessary to achieve the Tier 2 vehicle emission standards. Beginning in 2017, the Tier 3 emissions standards reduced the allowable sulfur content in gasoline from 30 ppm to 10 ppm to improve the performance of vehicles' emission control systems and to facilitate the development of technologies to improve fuel economy and reduce greenhouse gas emissions. Similarly, federal standards for heavy-duty gasoline and diesel highway vehicles became effective in 2004 and 2007[53], and these standards reduced the sulfur content of diesel fuel to 15 ppm to allow for the installation of emission controls on diesel engines. Because sulfur compounds in gasoline and diesel form SO_2 as a product of combustion, these sulfur content restrictions reduced SO_2 emissions as a co-benefit of EPA's light duty and heavy duty standards.

Attainment year and future year mobile source emissions were developed from the 2017 and 2027 emission inventories. Base year (2017) emissions in the attainment demonstration were obtained from the 2017 National Emissions Inventory (NEI), in which emissions were estimated from the MOVES model and state, local, and tribal (SLT) activity data when provided. Where SLT data were not provided, EPA-developed default activity based on data from the Federal Highway Administration. For the future year inventory (2027), Tennessee used EPA's MOVES model, version 3.0.3, to estimate emissions from onroad mobile sources in Sullivan County for 2027. Sullivan County's base year and future year emissions were apportioned to the nonattainment area by using a percentage (9.3%) derived from the 2010 Census Bureau Population data for the county and the population for the nonattainment area.

Tennessee obtained 2022 and 2037 mobile source emissions by interpolation (for 2022) and extrapolation (for 2037) of the existing data by assuming a constant rate of year-over-year change (i. e., by assuming emissions decrease by a constant percentage of the previous year's emissions rather than a constant tonnage)[54]. This method assumes that the rate of change is logarithmic rather than linear (**Figure 5-3**), so that mobile source emissions approach a minimum value over time without reaching zero. Using the 2017 base year as an initial condition and 2027 as a checkpoint, the year-over-year change was numerically determined (i. e., an initial estimate was adjusted up or down in small increments) until the projected 2027 emissions

[51]Environmental Protection Agency, *Federal Register***,** Vol. 65, No. 28, February 10, 2000. Federal Tier 2 vehicle emission standards require all passenger vehicles in a manufacturer's fleet, including light-duty trucks and Sport Utility Vehicles (SUVs), to meet an average standard of 0.07 grams of oxides of nitrogen (NO_x) per mile in 2007. The Tier 2 standards also cover passenger vehicles over 8,500 pounds gross vehicle weight rating (the larger pickup trucks and SUVs), which are not covered by the Tier 1 regulations. For these vehicles, the standards were phased in beginning in 2008, with full compliance in 2009.

[53]Environmental Protection Agency, *Federal Register*, Vol. 66, No. 12, January 18, 2001.

[54] Since two data points (2017 and 2027) are known, Tennessee considered whether to estimate 2022 and 2032 by assuming a linear relationship for all years and calculating a constant year-over year change in tons/year. Using that method, the average change in emissions would be (2027 emissions – 2017 emissions)/10, and 2022 emissions would be equal to (2017 emissions) + (change in emissions)(5 years). The problem with this method is that applying a constant tons/year decrease will eventually reach zero, and projected mobile source emissions would become negative by 2032. Therefore, this method was considered inadequate for projection of future emissions. In contrast, a constant ***rate of change*** requires that that the absolute value of the decrease will become smaller over time.

matched the value of the 2027 MOVES output. Using a year-over-year change of 13.25%, mobile source emissions for each year between 2018 and 2037 were determined in accordance with **Equation 5-1**. Onroad mobile source emissions are included in Attachment C.

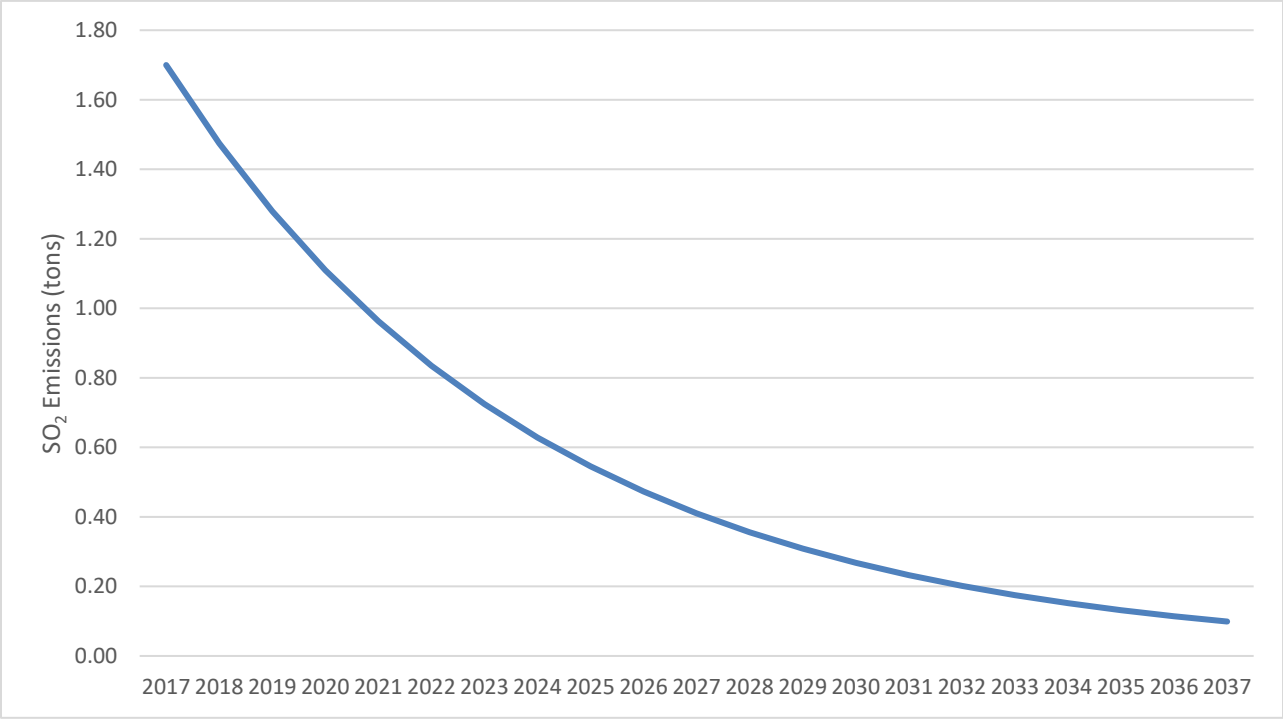

Figure 5-3: Projection of Onroad Mobile Source Emissions

Projected SO_2 emissions from onroad mobile sources are shown in **Table 5-6**. County-level emissions were apportioned to the nonattainment area by using a percentage (9.3%) derived from the 2010 Census Bureau Population data for the county and the population for the nonattainment area.

Year	Nonattainment Area SO_2 Emissions (tons)
2022	0.84
2037	0.10

5.2.1.4 Nonroad Mobile Sources (Excluding Locomotive/Rail Emissions)

Aircraft, commercial marine and rail future-year emissions were projected for 2022 using emission data sets and information used by U. S. EPA to develop the 2016v1 and 2016v2 emissions inventories[55,56]. For each source classification code, Tennessee obtained 2022 and 2037 mobile source emissions by interpolation (for 2022) and extrapolation (for 2037) of the existing data by assuming a constant rate of year-over-year change (i. e., by assuming emissions increase or decrease by a constant percentage of the previous year's emissions rather than a constant tonnage). This method assumes that the rate of change is logarithmic rather than linear, so that mobile source emissions approach a minimum value over time without reaching zero. Using the 2016 base year as an initial condition and 2026 as a checkpoint, the year-over-year change was numerically determined (i. e., an initial estimate was adjusted up or down in small increments) until the projected 2026 emissions matched EPA's 2026 inventory. Nonroad mobile source emissions for each year between 2018 and 2037 were determined in accordance with **Equation 5-1** and are summarized in **Table 5-7**. Nonroad emissions are included in Attachment D.

Table 5-7: Nonattainment Area Nonroad SO_2 Emissions (Excluding Locomotive/Rail)	
Year 2022	**SO_2 (tons/year)**
2022	0.089
2037	0.036

5.2.1.5 Locomotive/Rail Emissions

Base-year emissions from locomotives were taken from EPA's 2020 National Emissions Inventory (NEI), and locomotive emissions are counted as point, nonpoint, and as nonroad mobile sources. The 2020 NEI Technical Support Document for point sources[57] states that yard emissions are associated with the operation of switcher engines at each yard, and the 2020 NEI includes estimates compiled by EPA for most railyards in the U. S. In general, switchyards are reported as point sources to SCC 28500201, but some states report switchyards to nonpoint SCC 2285002010. Tennessee reviewed the 2020 point source inventory and found one entry for SCC 28500201, but a review of the latitude and longitude associated with this entry (36.547755, -82.567891) indicated that the emission point was located outside of the nonattainment area. The 2020 NEI for Tennessee indicates that railyard emissions were reported as nonpoint emissions (SCC 2285002006, Line Haul Locomotives: Class I Operations) and as nonroad mobile source emissions (SCC 2285002015, Railway Maintenance).

EPA's 2020 rail emissions[58] were developed with the support of the Lake Michigan Air Directors Consortium (LADCO) and the State of Illinois using confidential line-haul activity data from the Federal Railroad Administration. 2020 rail fuel consumption index values were used to allocate each Class 1 railroad's fuel use to links based on MGT, and the Association of American Railroads (AAR) provided EPA with locomotive fleet mix information for 2020 for emission factor application. Railyard emissions were calculated from fuel use and/or yard switcher counts provided by rail companies.

[55] The 2016v1 inventory is available online at https://www.epa.gov/air-emissions-modeling/2016v1-platform. The CSV file containing the nonroad inventory (2016version1_nonroad_from_MOVES2014b_forAQ_aggSCC_03sep2019_nf_v3.csv) is available at https://gaftp.epa.gov/Air/emismod/2016/v1/2016emissions/2016fh_inventory_nonroad_27sep2019_contents.txt.

[56] The 2016v2 inventory is available online at https://www.epa.gov/air-emissions-modeling/2016v2-platform. The CSV file containing the nonroad inventory (2016fj_v2platform_nonroad_from_MOVES_aggSCC_27apr2021_nf_v1.csv) is available at https://gaftp.epa.gov/Air/emismod/2016/v2/2016emissions/2016fj_nonroad_inventory_27may2021.zip.

[58] U. S. EPA, *2020 National Emissions Inventory Technical Support Document: Locomotives.*

2020 locomotive emissions were projected to 2022 and 2037 from the 2020 base year by assuming a 50% increase in emissions per decade. The 50% adjustment was based on a review of other nonroad categories and determining the highest calculated emissions increase for all nonroad categories (45% for several types of compressed natural gas-burning equipment). Locomotive emissions for 2022 and 2032 are shown in **Table 5-8** and in Attachment D.

2037	0.0069

5.2.1.6 Summary of Emission Inventories

The attainment year and future year emissions inventories for the Kingsport nonattainment area is summarized in **Table 5-9**.

Table 5-9: Summary of 2022 and 2037 Emissions Inventories		
Description	**2022 SO_2 Emissions (tons)**	**2037 SO_2 Emissions (tons)**
Point Sources	3,368.1	7,338.1
Area Sources	4.22	3.42
Onroad Mobile Sources	0.84	0.10
Nonroad Mobile Sources (Excluding Locomotive/Rail)	0.089	0.036
Locomotive/Rail Emissions	0.0039	0.0069
Total Emissions	**3,373**	**7,342**

5.2.2. Control Strategy (Including RACM/RACT)

The SIP must include enforceable emission limitations, and such other control measures, means or techniques (including economic incentives such as fees, marketable permits, and auctions of emission rights), as well as schedules and timetables for compliance, as may be necessary or appropriate to provide for attainment of such standard in such area by the applicable attainment date[59].

The SIP should provide for attainment of the standard based on SO_2 emission reductions from permanent and enforceable control measures, and States should consider all Reasonably Available Control Measures (RACM) and Reasonably Available Control Technologies (RACT) that can be implemented in light of the attainment needs for the affected area(s). EPA also promulgated other regulatory requirements that are expected to yield substantial SO_2 reductions, and the implementation of national and regional control measures should ease the process of planning for attainment of the SO_2 NAAQS.

Section 172(c)(1) of the CAA requires SIPs to provide for the implementation of all RACM to demonstrate attainment as expeditiously as practicable. A subset of RACM is reasonably available control technology (RACT), which relates specifically to stationary point sources. The nonattainment area has attained the standard and is eligible for redesignation well in advance of the 2027 statutory attainment date, and with the repowering of Eastman Chemical Company's B-253 powerhouse from coal to natural gas operation, the installation of add-on controls for Eastman's B-83 boilers, the adoption of a combined emission limit for Eastman's B-83 and B-325 powerhouses, and the adoption of existing emission limits into the SIP for other SO_2 sources at Eastman Chemical Company and Primester, there are no additional measures that are necessary to demonstrate attainment as expeditiously as practicable and no potential measures which, if considered collectively, would advance the attainment year by one year or more.

Tennessee's permanent and enforceable reductions (Section 4.0) consist of the repowering of B-253 Boilers 25 through 29 from coal to natural gas operation and installation of dry sorbent injection on B-83 Boilers 23

[59] CAA §172(c)(6).

and 24. Tennessee also adopted new emission limits for Eastman's coal-fired boilers, incinerators, and coal gasification flare and requested the adoption of other existing limits into the SIP as control measures. Tennessee requests adoption of these measures into the SIP via PSD construction permits 955272F and 966859F (Eastman Chemical Company), SIP operating permit 082237 (Eastman Chemical Company), and Title V Operating Permit 574994 (Primester).

6.0 Maintenance Plan Requirements

CAA §175A(a) requires each State that submits a request for redesignation of a nonattainment area for any air pollutant to submit a SIP revision that provides for the maintenance of the NAAQS in the area for at least 10 years after the redesignation. The plan shall contain such additional measures, if any, as may be necessary to ensure such maintenance. The enforceable measures identified in Section 4.0 of this submittal will ensure maintenance of the NAAQS.

Before an area can be redesignated to attainment, EPA must approve a maintenance plan that meets the requirements of CAA §175A[60]. The maintenance plan will constitute a SIP revision and needs to provide for maintenance of the SO_2 NAAQS in the area for at least 10 years after redesignation. Section 175A also requires the maintenance plan to contain a contingency plan with measures to ensure prompt correction of any violation of the SO_2 NAAQS. These measures should include a requirement that the air agency will implement all measures contained in the nonattainment area SIP for the area prior to the EPA's approval of the redesignation. Where a state has submitted an attainment plan for SO_2, that plan can also serve as the basis for the maintenance demonstration for the area. Because attainment plans generally rely on maximum allowable emissions, those plans can generally be considered to demonstrate that the standard will be maintained without regard to any changes in operation rate of the pertinent sources. Such plans may be assumed to provide maintenance for the requisite 10 years and beyond. EPA would expect the state to verify continued attainment by tracking the compliance status of the pertinent sources. The supporting elements for maintenance plans includes the following elements:

Attainment inventory: To demonstrate continued maintenance; states should develop an attainment inventory to identify the level of emissions in the affected area which is sufficient to attain and maintain the SO_2 NAAQS. This inventory should be consistent with the EPA's most recent guidance on emission inventories for nonattainment areas available at the time and should include the emissions during the time period associated with the monitoring or modeling data showing attainment. Tennessee's attainment year inventory is included in Section 5.2.1 of this submittal.

Maintenance demonstration: An air agency may generally demonstrate maintenance of the NAAQS by either showing that future emissions of SO_2 will not exceed the level of the attainment inventory, or by modeling to show that the future mix of sources and emission rates will not cause a violation of the NAAQS. As a part of the maintenance demonstration, the air agency should provide a listing of SO_2 control measures being implemented in the affected area by general source sector (e.g., point, area, and mobile). The air agency should also project emissions for at least the 10-year period following redesignation of the area to attainment under CAA section 175A(a). Where the state has submitted an attainment plan, this plan in many cases can also serve as a maintenance plan for the area. Insofar as an attainment plan generally relies on air quality dispersion modeling using maximum allowable emissions, the plan can generally be expected to demonstrate that the standard will be maintained for the requisite 10 years and beyond without regard to any changes io operation rate of the pertinent sources that do not involve increases in maximum allowable emissions. As discussed in Section 4.0, attainment of the NAAQS is based on permanent and enforceable emission

[60] An air agency may submit both the redesignation request and the maintenance plan at the same time and rulemaking on both may proceed on a parallel track. However, because the CAA requires a demonstration of maintenance for 10 years after an area is redesignated to attainment, EPA's guidance recommends that states plan for sufficient lead time to allow the EPA to take action on the submittal and the redesignation request.

reductions implemented for Eastman Chemical Company's coal-fired boilers and other SO_2 emitting sources at the facility and made permanent in the Tennessee SIP.

Monitoring network: Once an area has been redesignated to attainment, where air quality monitors exist in an area, the air agency should continue to operate an appropriate air quality monitoring network as provided under 40 CFR part 58 to verify the attainment status of the affected area. To ensure that ambient SO_2 concentrations continue to attain the NAAQS, Tennessee will continue ambient air quality monitoring in the redesignated area in accordance with 40 CFR 58. Should Tennessee petition to discontinue the operation of any monitor in the area, the Tennessee Department of Environment and Conservation's Division of Air Pollution Control will work with U.S. EPA Region 4 to ensure the necessary regulatory steps and guidelines for discontinuing monitoring are met. If EPA approves the petition to discontinue the use of one or more monitors, Tennessee commits to resume monitoring at any point if additional monitoring is required pursuant to 40 CFR Part 58, Appendix D, Section 4.4. Tennessee commits to the continued operation of a monitoring network for the area and will consult with EPA prior to making changes to the existing monitoring network, should such changes become necessary in the future.

Verification of continued attainment: Each state should ensure that it has the legal authority to implement and enforce all measures necessary to attain and maintain the 2010 SO_2 NAAQS. The air agency's submittal should indicate how it will track the progress of the maintenance plan for the area either through air quality monitoring or modeling.

Tennessee has the legal authority to implement and enforce all measures necessary to maintain the NAAQS pursuant to the Tennessee Air Quality Act (TCA 68-201) and Tennessee Air Pollution Control Regulations (TAPCR) 1200-03 and 0400-30. Tennessee also has the authority to implement the specific control measures required to maintain the NAAQS pursuant to the requirements established in SIP operating permit 082237, and these measures, along with the applicable monitoring, recordkeeping, and reporting requirements established in the permit, will ensure continued maintenance of the NAAQS. Tennessee will track the continued attainment and maintenance of the NAAQS through air quality monitoring as required by to 40 CFR part 58 and through implementation and enforcement of the SIP and its control measures.

Contingency Measures: CAA §175A (d) requires the maintenance plan to contain contingency provisions that will promptly correct any violation of the SO_2 NAAQS that occurs after the area is redesignated to attainment. Section 175A does not explicitly require that contingency measures must take effect without further action by the air agency, but the contingency plan is an enforceable part of the SIP and should ensure that contingency measures are adopted and implemented as expeditiously as practicable once they are triggered. The plan should clearly identify the measures to be adopted, provide a schedule and associated procedures for adoption and implementation, and provide a specific time limit for action by the air agency. At a minimum, §175A(d) requires that the air agency continue to implement all measures contained in the nonattainment area plan that was in place prior to redesignation of the affected area to attainment. An air agency may submit a SIP revision at the time of its redesignation request to remove or reduce the stringency of control measures.

In the *General Preamble for the Implementation of Title I of the Clean Air Act Amendments of 1990*[61], EPA provides further discussion of contingency measures for SO_2. This guidance states that in many cases, attainment revolves around compliance of a single source or a small set of sources with emission limits shown to provide for attainment. This guidance concludes that in such cases, "the EPA interprets 'contingency measures' to

[61] See 57 FR 13498 (April 16, 1992).

mean that the state agency has a comprehensive program to identify sources of violations of the SO_2 NAAQS and to undertake an aggressive follow-up for compliance and enforcement, including expedited procedures for establishing enforceable consent agreements pending the adoption of revised SIPs." Although this guidance applies to contingency measures for nonattainment plans, EPA envisions applying a similar policy with respect to the contingency measures required in maintenance plans under section 175A(d), consistent with the requirement that all NAA SIP or FIP requirements be implemented.

The two main elements of a contingency plan are triggering mechanisms to determine when contingency measures are needed and a process of developing and adopting appropriate control measures. The primary trigger(s) of the contingency plan and associated control measures submitted with Condition G4 of SIP permit 082237. This permit condition states:

> Upon notification by the Technical Secretary that a reference monitor for the area has registered four validated ambient SO_2 concentrations in excess of the standard (75 parts per billion, 99^{th} percentile of daily maximum one-hour average concentrations determined in accordance with 40 CFR 50, Appendix T) during any maintenance period approved pursuant to CAA §§175a(a) and (b), the permittee shall undertake a full system audit of all emissions units subject to control under this plan. The permittee must submit a written system audit report within 30 days of the notification. The system audit report must detail the operating parameters of all emissions units, including modeled emission units that were excluded from the SIP, for four 10-day periods up to and including the date upon which the reference monitor registered each exceedance, together with recommended provisional SO_2 emission control strategies for each affected unit and evidence that these control strategies have been deployed, as appropriate. Upon consultation with the Technical Secretary, the permittee shall develop and implement operational changes as necessary to prevent future monitored violations of the standard. These changes may include fuel switching, physical or operational reduction of production capacity, or other changes as appropriate. If a permit modification is deemed necessary, any changes to existing permit conditions shall follow the applicable procedures of TAPCR 1200-03-09. If an emission source is found to be noncompliant with a SIP emission limit, the Technical Secretary will, in addition to conducting enforcement proceedings to bring the source into compliance with its SIP limit, determine whether additional limits must be added to the SIP to meet the requirements of section 172(c)(9) of the Clean Air Act.

Tennessee will implement all SO_2 control measures, continue to enforce the contingency measures identified in Condition G4 of permit 082237, and will notify EPA of any exceedances that trigger the contingency measures of Condition G4.

In addition to the primary trigger described above, Tennessee has a comprehensive program to identify sources of violations of the SO_2 NAAQS and will undertake an aggressive follow-up for compliance and enforcement, including expedited procedures for establishing enforceable consent agreements pending the adoption of revised SIPs. A trigger-level response will consist of a study to determine whether emissions from sources within the nonattainment area (or nearby sources located outside of the nonattainment area, as appropriate) are increasing or indicate a trend toward higher sulfur dioxide concentrations. The study would evaluate whether the trend, if any, is likely to continue and any control measures necessary to reverse the trend, taking into consideration ease and timing for implementation, as well as economic and social considerations. If new control measures are already promulgated and scheduled to be implemented at the

Federal or State level, and if those measures are determined to be sufficient to address any increase in peak sulfur dioxide concentrations, additional local measures may be unnecessary. Tennessee will submit to the EPA an analysis to assess whether the proposed measures are adequate to reverse the increase in sulfur dioxide concentrations and to maintain the NAAQS within the area. If additional controls are necessary, Tennessee will implement the appropriate contingency measures needed to assure future attainment of the sulfur dioxide NAAQS. Contingency measures would be adopted and implemented as expeditiously as possible, but no later than 24 months after the triggering event. The proposed schedule for these actions would be as follows:

- Six months to identify appropriate contingency measures, including identification of emission sources and appropriate control technologies;

- Between three and six months to initiate a stakeholder process; and

- Between nine and twelve months to implement the contingency measures. This step would include the time required to draft rules or SIP amendments, complete the rulemaking process, and submit the final plans to EPA.

If a longer schedule is required to implement specific contingency measures, then, upon selection of the appropriate measures, Tennessee will notify EPA of the proposed schedule and will provide sufficient information to EPA to demonstrate that the proposed measures are a prompt correction of the triggering event. The selection of emission control measures will be based on cost-effectiveness, emission reduction potential, economic and social considerations, or other factors that the state deems to be appropriate. Selected emission control measures will be subject to public review, and Tennessee will seek public input prior to selecting new emission control measures.

CAA §175A(b) requires each state, within eight years after redesignation of any area as an attainment area, to submit to the Administrator an additional SIP revision for maintaining the NAAQS for 10 years after the expiration of the 10-year period referred to in CAA §175A(a). Within eight years of redesignation of the area, Tennessee will submit an additional SIP revision to ensure continued maintenance of the SO_2 NAAQS for the second 10-year period.

32	RICE-3	RICE-3 Emergency Engine	0.01
34	B-232-1	B-232-1 Manufacture of Aromatic Acids	0.045
Total			**3,367**

[1] MSOP-17 SAR July - December 2022. This value excludes 31.5 tons of excess emissions due to startup, shutdown, and malfunction events.
[2] MSOP-17 SAR July- December 2022. The value reported with the emissions inventory is incorrect.
[3] Allowable emission rate from permit 572407.
[4] Maximum allowable emission rate.
[5] Used the highest annual emission rate reported for 2017-2021, as used in the 2022 attainment demonstration.

[6] Construction permit 978695 was issued to Eastman Chemical Company on August 3, 2021, to allow the construction of three new natural gas-fired boilers (B-83 Boilers 32, 33, and 34) with a nominal heat input of 249 MMBtu/hr each. The permit requires Eastman to permanently cease operation of B-83 Boilers 18, 19, and 20 following the startup of Boilers 32, 33, and 34 (one coal-fired boiler must be shut down for each natural gas-fired boiler that begins operation), but Tennessee did not take credit for the shutdowns in the redesignation request.

[7] Modeled emission rate. Fugitive emissions are modeled in g/s*m^2, where the fugitive area is 2,425,384 m^2 (1353.3 m x 1792.2 m).

[8] Construction permit 978695 was issued February 16, 2021, to allow the construction of a new plastics processing facility and methanolysis plant. Upon startup, the plastics processing facility will receive plastic waste/trash and unprocessed polyethylene terephthalate (PET) to produce processed PET as a feedstream for the methanolysis plant and processed mixed plastic for resale. The methanolysis plant will process PET waste into the corresponding monomers (dimethyl terephthalate and ethylene glycol) using methanol, sodium hydroxide, and a catalyst.

Calculation of Future-Year Emissions for Area Sources (All SCCs Except for 2610000400 and 2610000500)

Because there are no existing projections for 2027, future year (2037) emissions inventories were projected using the existing emission inventories for 2016 (EPA's 2016v1 emission inventory) and 2026 (EPA's 2016v2 inventory). This procedure is illustrated below using source classification code 2102004002.

1. Calculate the difference between 2016 and 2026 using the following formula:

   Change in emissions = (2026 emissions in tons) – (2016 emissions in tons)
   Change in emissions = (2.5320375 tons) – (2.02563 tons) = 0.5064075 tons

2. Calculate the incremental change in emissions using the following formula:

$$\text{Incremental change in emissions} = \frac{(\text{change in emissions})}{(10 \text{ years})}$$

$$\text{Incremental change in emissions} = \frac{(0.5064075 \text{ tons})}{(10 \text{ years})} = 0.05064075 \text{ tons/year}$$

3. Calculate emissions for 2017 through 2037 as follows (**Table B-2**):

Table B-2: Example Calculation of Future Year Emissions (SCC 2102004002)

Year	Description	SO_2 Emissions (tons/year)
2016	Baseline	2.02563
2017	2016 Emissions plus 0.05064075 tons	2.07627075
2018	2017 Emissions plus 0.05064075 tons	2.1269115
2019	2018 Emissions plus 0.05064075 tons	2.17755225
2020	2019 Emissions plus 0.05064075 tons	2.228193
2021	2020 Emissions plus 0.05064075 tons	2.27883375
2022	2021 Emissions plus 0.05064075 tons	2.3294745
2023	2022 Emissions plus 0.05064075 tons	2.38011525
2024	2023 Emissions plus 0.05064075 tons	2.430756
2025	2024 Emissions plus 0.05064075 tons	2.48139675
2026	2025 Emissions plus 0.05064075 tons	2.5320375
2027	2026 Emissions plus 0.05064075 tons	2.58267825
2028	2027 Emissions plus 0.05064075 tons	2.633319
2029	2028 Emissions plus 0.05064075 tons	2.68395975
2030	2029 Emissions plus 0.05064075 tons	2.7346005
2031	2030 Emissions plus 0.05064075 tons	2.78524125
2032	2031 Emissions plus 0.05064075 tons	2.835882
2033	2032 Emissions plus 0.05064075 tons	2.88652275
2034	2033 Emissions plus 0.05064075 tons	2.9371635
2035	2034 Emissions plus 0.05064075 tons	2.98780425
2036	2035 Emissions plus 0.05064075 tons	3.038445
2037	2036 Emissions plus 0.05064075 tons	3.08908575

Calculation of Future-Year Emissions for Area Sources (SCCs 2610000400 and 2610000500)

For Source Classification Codes 2610000400 (Open Burning - Yard Waste – Brush) and 2610000500 (Open Burning - Land Clearing Debris), Tennessee calculated base year and future year emissions by assuming that the rate of change (rather than the absolute change in tons/year) would be a uniform value, such that the change in SO_2 emissions decreases more slowly in future years, as shown below1.

2016 SO_2 emissions = 45.2521 tons (initial condition)
2017 SO_2 emissions = (45.2521 tons)(1-rate of change)
2018 SO_2 emissions = (2017 SO_2 emissions)(1-rate of change)
2019 SO_2 emissions = (2018 SO_2 emissions)(1-rate of change)
Etc.

The rate of change was determined from an iterative process. Because 2016 and 2026 SO_2 emissions were known, Tennessee determined the appropriate value by making an initial estimate for the rate of change, calculating SO_2 emissions for all years between 2016 and 2026, comparing the 2026 calculation to the 2026 inventory, and adjusting the rate of change up or down as needed. This calculation was repeated until the calculated value for 2026 matched the inventory.

Using this methodology, Tennessee found that the calculated emissions matched the 2026 inventory at a uniform rate of change of -9.000% for both SCCs. SO_2 emissions from both SCCs are shown in **Table B-3** for all years between 2016 and 2037.

Table B-3: Calculation of Future Year Emissions (SCCs 2610000400 and 2610000500)

Year	Nonattainment Area SO_2 Emissions (tons)	
	Open Burning of Land Clearing Debris	Open Burning of Yard Waste/Brush
2016	45.25210	0.15010
2017	41.28882	0.13659
2018	37.67265	0.12429
2019	34.37320	0.11311

1 A constant rate of change was assumed because if a constant change in tons per year is used, then the 2037 emissions for both SCCS are negative by 2037.

Table B-3: Calculation of Future Year Emissions (SCCs 2610000400 and 2610000500)		
	Nonattainment Area SO_2 Emissions (tons)	
Year	Open Burning of Land Clearing Debris	Open Burning of Yard Waste/Brush
2034	8.69212	0.02749
2035	7.93085	0.02501
2036	7.23624	0.02276
2037	6.60248	0.02071

Partitioning of County-Level SO_2 Emissions Inventory for Area Sources, Onroad and Nonroad Mobile Sources, and Locomotives

County-level emissions were apportioned to the nonattainment area by using a percentage (9.3%) derived from the 2010 census. The population inside the nonattainment area was estimated by reviewing the population data for census blocks located inside of the nonattainment area (**Figure B-1, Table B-4**), and a ratio of Census Bureau population data for the county and the nonattainment area was calculated, as follows:

Sullivan County population (2010 Census): 156,283
Nonattainment area population (2010 Census): 14,643

$$\left[\frac{14{,}643}{156{,}823}\right] \times 100\% = 9.3\%$$

Area source emissions for the nonattainment area were calculated as:

(2017 emissions for entire county)(0.093) = (2017 nonattainment area emissions)

Example: Fuel Comb - Industrial Boilers, ICEs - Biomass

Sullivan County emissions (entire county): 8.41 tons
(8.41 tons)(0.093) = 0.7824 tons

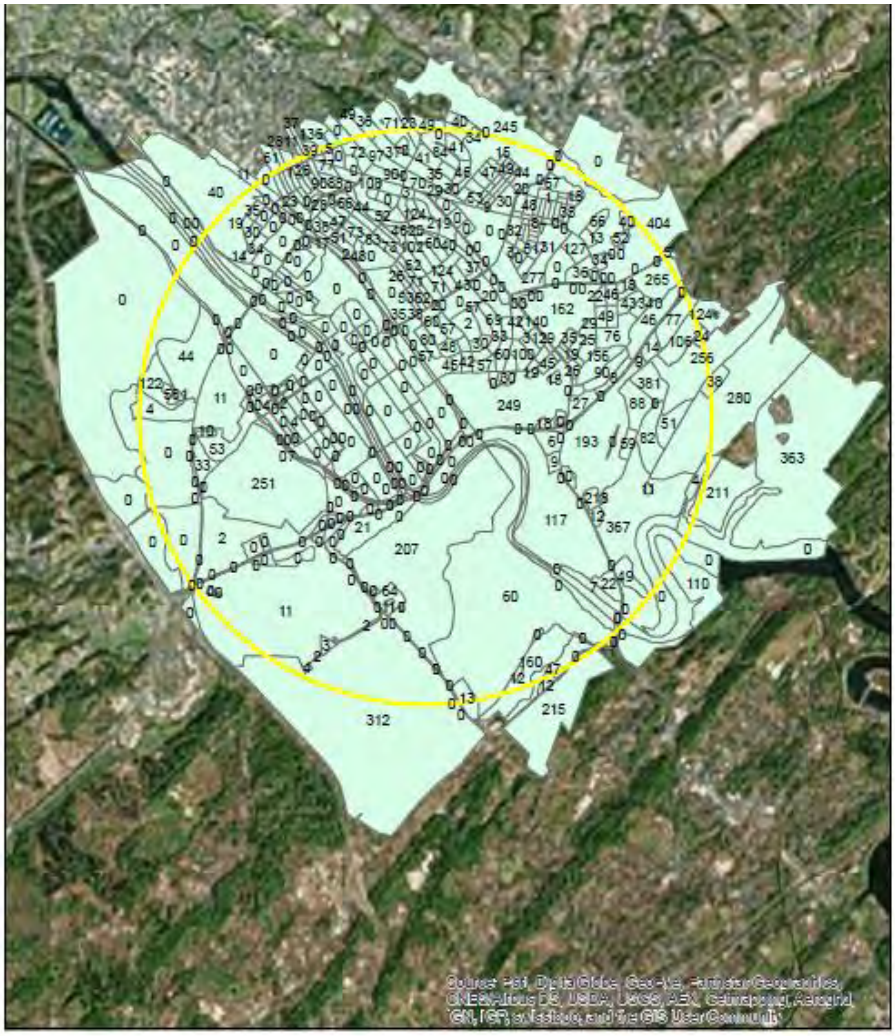

Figure B-1: Population of Nonattainment Area Census Blocks

Tennessee believes that this method adequately estimates nonattainment area emissions because area and nonpoint emission sources, in general, are population-related (i. e., emissions vary with population), and because nonpoint source emissions are significantly less than point sources in the nonattainment area.

Table B-4: SO_2 NAA Population Analysis 11/6/2014

County-level emissions were apportioned to the nonattainment area using the procedure described above.

Attachment C
SO_2 Onroad Mobile Source Emissions Inventory

Tennessee developed its 2022 and 2037 onroad mobile source emissions inventories from information submitted in the 2023 SO_2 Attainment Demonstration for Sullivan County. In that submittal, 2017 emissions were obtained directly from the NEI, and 2027 projections were developed with EPA's MOVES (MOtor Vehicle Emissions Simulator) model for onroad mobile sources. The 2017 NEI results are shown in **Table C-1**, and documentation of the MOVES runs is included at the end of this attachment. County-wide emissions from onroad mobile sources were partitioned to the nonattainment area using the methodology described in Attachment B.

Table C-1: Sullivan County 2017 Onroad Mobile Source Emissions

FIPS Code	County	Sector	Data Category	2017 SO_2 Emissions (tons)	Dataset	Nonattainment Area Emissions (tons)
47163	Sullivan	Mobile - On-Road Diesel Heavy Duty Vehicles	Onroad	1.97	2017NEI	0.183
47163	Sullivan	Mobile - On-Road Diesel Light Duty Vehicles	Onroad	0.18	2017NEI	0.0164
47163	Sullivan	Mobile - On-Road non-Diesel Heavy Duty Vehicles	Onroad	0.27	2017NEI	0.0252
47163	Sullivan	Mobile - On-Road non-Diesel Light Duty Vehicles	Onroad	15.86	2017NEI	1.4752
Total						**1.70**

The MOVES output projected 0.41 tons of mobile source SO_2 emissions within the nonattainment area. As an initial estimate, Tennessee used the difference between 2017 and 2027 (decrease of 1.29 tons) to project base year 2037 emissions assuming a uniform rate of change (average decrease of 0.129 tons/year). While this method produced a reasonable estimate for 2022 (1.055 tons of emissions from onroad mobile sources within the nonattainment area), that method could not be used to project future year emissions, because a uniform decrease of 0.129 tons/year produces an invalid result for 2037 (i. e., mobile source emissions would be less than zero using this method).

As an alternative to the method described above, Tennessee calculated base year and future year emissions by assuming that the rate of change (rather than the absolute change in tons/year) would be a uniform value, such that the change in SO_2 emissions decreases more slowly in future years, as shown below.

2017 SO_2 emissions = 1.70 tons (initial condition)
2018 SO_2 emissions = (1.70 tons)(1-rate of change)
2019 SO_2 emissions = (2018 SO_2 emissions)(1-rate of change)
2020 SO_2 emissions = (2019 SO_2 emissions)(1-rate of change)
Etc.

The rate of change was determined from an iterative process. Because 2017 and 2027 SO_2 emissions were known, Tennessee determined the appropriate value by making an initial estimate for the rate of change, calculating the SO_2 emissions for all years between 2017 and 2027, comparing the calculated result for 2027 to the MOVES output, adjusting the rate of change up or down as needed, then repeating the calculation until the calculated value for 2027 matched the MOVES output. Using this methodology, Tennessee found that the calculated emissions matched the 2027 MOVES output at a uniform rate of change of 13.25%, and emissions for 2022 and 2037 were calculated as follows:

2017 SO_2 emissions = 1.70 tons (initial condition)
2018 SO_2 emissions = (1.70 tons)(1-0.1325) = 1.47 tons
2019 SO_2 emissions = (1.47 tons)(1-0.1325) = 1.28 tons

SO_2 emissions from onroad mobile sources for all years between 2017 and 2037 are shown in **Table C-2**. When represented graphically (**Figure C-1**), the calculation shows that mobile source emissions decrease more slowly within the nonattainment area over time. County-level emissions were apportioned to the nonattainment area using the same procedure described in Attachment B.

Table C-2: Onroad Mobile Source Emissions for 2022 and 2037	
Year	**Nonattainment Area SO_2 Emissions (tons)**
2017	1.70
2018	1.47
2019	1.28
2020	1.11
2021	0.96
2022	0.84
2023	0.72
2024	0.63
2025	0.55
2026	0.47
2027	0.41
2028	0.36
2029	0.31
2030	0.27
2031	0.23
2032	0.20
2033	0.17
2034	0.15
2035	0.13
2036	0.11
2037	0.10
Yellow highlights are NEI (2017) and MOVES (2027) years. Orange highlights are base year (2022) and future year (2037) for redesignation.

Nonroad Mobile Sources (Excluding Locomotives): Nonroad mobile source emissions were projected for 2022 and 2037 using emission data sets and information used by U. S. EPA to develop the 2016v1 and 2016v2 emissions inventories. For each source classification code, Tennessee obtained 2022 and 2037 mobile source emissions by interpolation (for 2022) and extrapolation (for 2037) of the existing data by assuming a constant rate of year-over-year change (i. e., by assuming emissions increase or decrease by a constant percentage of the previous year's emissions rather than a constant tonnage). This method assumes that the rate of change is logarithmic rather than linear, so that mobile source emissions approach a minimum value over time without reaching zero. Using the 2016 base year as an initial condition and 2026 as a checkpoint, the year-over-year change was numerically determined (i. e., an initial estimate was adjusted up or down in small increments) until the projected 2026 emissions matched EPA's 2026 inventory.

Tennessee calculated base year and future year emissions by assuming that the rate of change (rather than the absolute change in tons/year) would be a uniform value, such that the change in SO_2 emissions decreases more slowly in future years, as shown below for SCC 2260001022.

2016 SO_2 emissions = 0.005776946 tons (initial condition)
2017 SO_2 emissions = (0.005776946 tons)(1-rate of change)
2018 SO_2 emissions = (2017 SO_2 emissions)(1-rate of change)
2019 SO_2 emissions = (2018 SO_2 emissions)(1-rate of change)
Etc.

The rate of change was determined from an iterative process. Because 2016 and 2026 SO_2 emissions were known, Tennessee determined the appropriate value for each SCC by making an initial estimate for the rate of change, calculating the SO_2 emissions for all years between 2016 and 2026, comparing the calculated result for 2026 to 2026 inventory value, adjusting the rate of change up or down as needed, then repeating the calculation until the calculated value for 2026 matched the 2026 inventory value. Using this methodology, Tennessee calculated future emissions at a uniform rate of change (-8.90% for SCC 2260001022).

2017 SO_2 emissions = 0.005776946 tons (initial condition)
2018 SO_2 emissions = (0.005776946 tons)(1-0.089) = 0.005262798 tons
2019 SO_2 emissions = (0.005262798 tons)(1-0.089) = 0.004794409 tons
Etc.

County-level emissions were apportioned to the nonattainment area using the same procedure described in Attachment B.

Locomotive Emissions: Locomotive emissions were calculated for 2022 and 2032 from the 2020 National Emissions Inventory, and county-level emissions were apportioned to the nonattainment area using the same procedure described in Attachment B.

Table D-2: Sullivan County 2020 Locomotive SO_2 Emissions				
SCC Code	**SCC Description**	**EIS Sector**	**Source Description**	**SO_2 Emissions (tons)**
2285002006	Mobile Sources – Railroad Equipment, Diesel Line Haul Locomotives: Class I Operations	Mobile - Locomotives	Nonpoint	0.03817
2285002015	Mobile Sources – Railroad Equipment, Diesel Railway Maintenance	Mobile - Non-Road Equipment - Diesel	Nonroad	0.00034
Total				**0.03851**
Total (Nonattainment Area Only)				**0.00358**

Locomotive emissions were projected to 2022 and 2037 from the 2020 inventory by assuming a 50% increase in emissions per decade (i. e., a 10% increase every two years). As discussed in the narrative for the redesignation request, the 50% adjustment was based on a review of other nonroad categories and determining the highest calculated emissions increase for all nonroad categories (45% for several types of compressed natural gas-burning equipment). Locomotive emissions for 2022 and 2037 are shown in **Table D-3**.

Table D-3: 2022 and 2037 Locomotive Emissions	
Year	**Nonattainment Area SO_2 Emissions (tons)**
