|                                               | <i>NOTE:</i> Plan would be part of CERCLA document, such as a Remedial Action Work Plan. Plan to include items described in 40 C.F.R. § 230.94(c)(2) through (c)(14). <sup>16</sup>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                       |                                                                       |
| Compensatory Mitigation Performance Standards | The approved mitigation plan must contain performance standards that will be used to assess whether the project is achieving its objectives. Performance standards should relate to the objectives of the compensatory mitigation project, so that the project can be objectively evaluated to determine if it is developing into the desired resource type, providing the expected functions, and attaining any other applicable metrics (e.g., acres).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Alteration of wetlands requiring compensatory mitigation to replace lost aquatic resource functions – <b>Relevant and Appropriate</b> | 40 C.F.R. § 230.95 (a)<br><br><i>Ecological Performance Standards</i> |
|                                               | Performance standards must be based on attributes that are objective and verifiable. Ecological performance standards must be based on the best available science that can be measured or assessed in a practicable manner.<br><br>Performance standards may be based on variables or measures of functional capacity described in functional assessment methodologies, measurements of hydrology or other aquatic resource characteristics, and/or comparisons to reference aquatic resources of similar type and landscape position. The use of reference aquatic resources to establish performance standards will help ensure that those performance standards are reasonably achievable, by reflecting the range of variability exhibited by the regional class of aquatic resources as a result of natural processes and anthropogenic disturbances. Performance standards based on measurements of hydrology should take into consideration the hydrologic variability exhibited by reference aquatic resources, especially wetlands. |                                                                                                                                       | 40 C.F.R. § 230.95 (b)<br><br><i>Ecological Performance Standards</i> |

<sup>16</sup> If mitigation obligations will be met by securing credits from approved mitigation banks or in-lieu fee programs, mitigation plan need include only items described in Section 230.94(c)(5) and (c)(6), and name of mitigation bank or in-lieu fee program. 40 C.F.R. § 230.94(c)(1).

**Additional information for the response to Specific Comment 166**

On-site wastewater treatment units that are part of a wastewater treatment facility subject to regulation under Section 402 or Section 307(b) of the CWA are exempt from the requirements of RCRA Subtitle C for all tank systems, conveyance systems (whether piped or trucked), and ancillary equipment used to store or transport RCRA contaminated water (40 *CFR* 264.1[g][6]). Therefore, RCRA tank requirements are not legally applicable to the EMDF wastewater treatment facility even if EMDF leachate were above RCRA hazardous waste characteristic levels, which historically has not been approached at the EMWMF.

The CERCLA NCP at 40 *CFR* 300.400(g)(2) sets out several factors in determining if a requirement that is not applicable is otherwise relevant and appropriate. These factors are compared between the requirement itself and the CERCLA action: (1) purpose of the requirement/purpose of the CERCLA action; (2) media involved or affected; (3) substances involved; (4) actions or activities addressed; (5) any variances or exemptions that apply; (6) type of place regulated/type of place affected by CERCLA action; (7) type and size of structure or facility; and, (8) any consideration of use or potential use of affected resources.

The purpose of the requirement and type of structure involved in the RCRA tank regulations is the prevention of the release of hazardous waste while being stored or treated in tanks. In the original rulemaking, the preamble noted that 75 to 80 percent of tank system failures in the API study resulted from corrosion due to contact with the soil with underground tanks. Secondary containment requirements in part addressed this concern. The EMDF wastewater treatment system does not have this concern since it is designed to use only aboveground tanks. Although other factors cited in the RCRA rulemaking can result in a release, even in aboveground tanks, this major cause of releases to the environment that is undetected over time is not present in this CERCLA action. Even for the limited underground conveyance piping from the leachate collection system to the

wastewater treatment facility, EMDF design as a best management practice uses double-walled pipe to ensure protectiveness. In addition, although not meeting the stringent burdensome requirements of the RCRA tank requirements, the EMDF design will have secondary containment. RCRA Tank requirements are designed to address hazardous waste at any concentration level and the threat of release to the environment that these very toxic wastes could pose. The RCRA tank requirements incorporate very stringent tank design and secondary containment measures to address such elevated risks; these elevated risks are not present for EMDF wastewaters, which are not anticipated to even come close to exceeding TCLP characteristic levels.

The RCRA tank regulations also address the activity of storage or treatment of hazardous waste, which can be over extended timeframes. The requirements incorporate provisions such as corrosion protection systems and requirements for compatibility of hazardous wastes with the container. None of these concerns would be relevant and appropriate to the aboveground storage of wastewater originating from EMDF leachate that is well below hazardous waste levels which will not have the same potential corrosive effect on the tanks or ancillary equipment as would a hazardous waste. The storage of leachate in the EMDF wastewater tanks will be of short duration while awaiting treatment. In addition, the EMDF wastewater treatment system is anticipated to be operated for 26 years. Over such a short operational life, corrosion concerns or tank system failure should be negligible (as demonstrated by lack of such issues with the EMWWMF leachate tanks).

The medium or substance involved is leachate. The RCRA tank requirements are applicable to those tanks containing hazardous waste. Similar to the EMWWMF, the EMDF will not accept listed hazardous waste and will require all RCRA hazardous waste to be treated to the RCRA LDRs or lower prior to disposal. Based on historical data from EMWWMF, it is unlikely that the leachate or contact water from EMDF will ever approach RCRA hazardous waste characteristic levels. In fact, leachate has remained orders of magnitude below characteristic levels. Although EMDF will have somewhat different waste streams, the proportion of treated RCRA hazardous waste to other waste streams is anticipated to be substantially similar to the EMWWMF, although a smaller portion in relation to other waste streams due to EMDF WAC restrictions.

As set out above, the 40 CFR 264.1(g)(6) exemption is a factor which would weigh against the tank requirements as relevant and appropriate since in establishing this exemption, EPA conditioned the exemption on the wastewater treatment unit being subject to regulation under the CWA in order to assure protectiveness. The EMDF ROD has cited the CWA-related and Tennessee Water Quality Control Act-related requirements as ARARs.

Weighing these factors together would weigh against the RCRA tank requirements as being relevant and appropriate to the EMDF wastewater treatment system which is not storing hazardous waste, is storing leachate for a short duration prior to treatment, has a relatively short operational life, has daily inspections of aboveground tanks and all conveyance piping during operations, and is provided with secondary containment designed to meet the site-specific circumstances to prevent release to the environment.

The EDMF wastewater treatment facility will be operated in compliance with all ARARs identified in the ROD. This will ensure all wastewater from EDMF will be treated to levels to meet CWA requirements for treatment and meet all applicable Tennessee narrative and numeric water quality criteria that is protective for fish and aquatic life and recreational uses, as well as meet a  $10^{-5}$  risk level for all carcinogenic pollutants.

|                                              |                                                                                                                                                                                                                                     |                              |                                                 |

| <b>GENERAL COMMENTS</b> |             |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| D                       | 1           |               | <p><b>Remedy Protectiveness</b><br/>Per 40 CFR 300.430(f)(5)(ii)(A) the ROD must describe how the selected remedy is protective of human health and the environment. This D1 ROD lacks the information needed to demonstrate protective landfill wastewater discharge limits and waste acceptance criteria (WAC). The ROD does not include remediation goals to be met in adjacent groundwater, surface water and other affected environmental media per 40 CFR 300.430(f)(5)(iii)(A).</p> | <p>Agree – first two sentences. While the D1 ROD describes compliance with the Clean Water Act, the specific remediation goals for landfill wastewater are specified in the D2 ROD following a final agreement between the FFA parties. The approach agreed upon among the FFA parties is consistent with the Clean Water Act. The discharge limits will be developed in the future, based on the remediation goals, when the specifics of the EMDF landfill wastewater treatment system are knowns, including the discharge location. These remediation goals and future discharge limits are within the CERCLA risk range and protective of Human Health and the Environment.</p> <p>Disagree – final sentence. Under a traditional CERCLA action, remediation goals represent the cleanup levels in the “affected” media the remedial action is trying to achieve. For EMDF, the ROD is not trying to remediate any soil, groundwater, surface water, or other environmental media to a particular cleanup level. These remediation goals would be included in decision documents for projects that are sending waste to EMDF. The EMDF ROD has remedial action objectives tailored to the action (e.g., prevent exposure that exceeds an acceptable human health risk, prevent adverse impacts to water resources, etc.). Since this remedial action does not involve clean-up of the soil, surface water, or groundwater at or around the EMDF facility, it would not have these traditional remediation goals.</p> |

| S<br>A<br>W<br>M<br>O<br>D<br>P | 2           |               | <p><b>Key Concerns</b><br/>           In the <i>Proposed Plan for the Disposal of Oak Ridge Reservation Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Waste</i> (DOE/OR/01-2695&amp;D2/R1), the state of Tennessee identified seven outstanding issues to be resolved before a ROD selects onsite disposal as the preferred waste management alternative for future ORR waste generated under the CERCLA. This general comment summarizes each issue and evaluates the status of efforts to resolve the concern.</p> <p>a. Site Characterization<br/>           TDEC requested that DOE investigate the suitability of the proposed landfill location, known as the CBCV Site 7c. A particular concern was the potential for high groundwater levels in portions of the planned landfill to facilitate contaminant release into streams.</p> <p>In response to TDEC’s request, DOE collected data on hydrologic conditions at the site and summarized the information in two reports: a “Pre-published Technical Memorandum #1” (TM-1) and a follow-on document called “Technical Memorandum #2” (TM-2). DOE placed the reports and the data in the Administrative Record.</p> <p>TM-2 (p. 1-2) provides a link to the data in Oak Ridge Environmental Information System (OREIS), but the link is broken. The web address for OREIS has changed several times since TM-2 was issued. DOE should redirect OREIS visitors from the old address to the new one.</p> <p>Site characterization data revealed high groundwater levels in portions of the planned landfill, which indicate the conceptual EMDF design presented in the Proposed Plan may need revision to elevate the landfill. Per agreement among the FFA Parties, DOE will complete a groundwater field demonstration (GWFD) after ROD approval to establish the elevation of the base of the landfill. Section 2.14.3 of the D1 ROD provides additional information.</p> <p>b. Identification of Applicable or Relevant and Appropriate Requirements (ARARs)<br/>           The FFA Parties must agree upon legal requirements to govern the siting, construction, operation, closure, and monitoring of EMDF. Under CERCLA, these requirements are called ARARs. Compliance with these requirements, including waivers and exemptions approved with adequate</p> | <p>a. Site Characterization<br/>           Clarification provided. No changes to TM-2 are necessary. The updated OREIS link is provided as part of the materials provided for the additional public comment period. In addition, text was added to the description of Technical Memorandum #2 data in Sect. 2.2.1 “(Note that the data supporting this document are available as text files on the DOE Oak Ridge Environmental Information System [OREIS] [<a href="https://ucor.com/oak-ridge-environmental-information-system-oreis/">https://ucor.com/oak-ridge-environmental-information-system-oreis/</a>]).” A similar note was also added in Sect. 2.3.</p> <p>b. Comment noted. DOE has worked with the other FFA parties to obtain agreement on the list of ARARs and TBCs to be included in the ROD. Text had been added to include the first requested notation in regards to the absence of compliance text when the scope of the remedy does not trigger the requirement or involve the</p> |

|----------|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |               | <p>justification, is a threshold criterion of CERCLA.</p> <p>The approved ROD will list the ARARs agreed upon for EMDF. Under CERCLA, the ROD will function similar to a waste management permit under other regulatory programs, so the ARARs are similar to permit requirements. In the D1 ROD, ARARs are listed in Appendix A, and Section 2.13.2 discusses ARAR compliance, including waivers and exemptions DOE is requesting.</p> <p>Appendix G in the December 7, 2017 Dispute Resolution Agreement (DRA) included a preliminary list of ARARs and supplemental guidance documents To Be Considered (TBC). TDEC understood the 2017 list was a foundation upon which to build as the FFA Parties worked toward the ROD. On December 31, 2020, the EPA Administrator issued a Dispute Resolution Decision (DRD) concerning a long-standing dispute regarding the discharge of CERCLA landfill wastewater to Bear Creek from the Environmental Management Waste Management Facility (EMWMF) and the proposed EMDF. In conjunction with the DRD, EPA provided additional ARARs to be included in the RODs for both landfills.</p> <p>Throughout 2021, the FFA Parties have met several times in an effort to agree on the final list of ARARs and TBCs to be included in the EMDF ROD. Currently, no agreement has been reached.</p> <p>When the ARAR section of the ROD is finalized, it should note 1) the absence of language to address a specific situation as an aspect of the remedy in a CERCLA decision document, including ARARs to be either met or appropriately waived, means the scope of the remedy does not include the situation and requirements pertaining to it, and 2) the state of Tennessee retains its authority to impose the standards of the legal requirement both substantive and procedural outside the context of CERCLA and the FFA.</p> <p>c. Waste Acceptance Criteria (WAC)<br/>                     WAC are limits on the kinds and amounts of waste that may be placed in the landfill. WAC determine which wastes require treatment and/or disposal at suitable offsite facilities due to their radioactivity, toxicity, or hazardousness. WAC are important for protecting the public and the environment over the long term, when engineered infrastructure, access restrictions, and other controls may deteriorate or fail.</p> | <p>situation the requirement addresses. DOE disagrees that the second requested statement is necessary as this type of language has not been included in other ORR decision documents, and the ORR FFA between the parties already contains language as to the state's retention of authority outside of CERCLA.</p> <p>c. Comment noted. The FFA parties have agreed on the Waste Lot Concentration Limits (WLCLs) provided in the D1 ROD for projects disposing of waste in the landfill through Waste Handling Plans. These WAC are provided for the generators who dispose of waste lots typically smaller than 10% of the total landfill volume capacity and are protective within the CERCLA risk range. The basis for CERCLA</p> |

|          |             |               | <p>It is TDEC’s expectation the approved ROD will list WAC meeting CERCLA requirements and any additional limitations agreed upon for EMDF. Several comments included below address the CERCLA threshold criterion for protectiveness of public health based on meeting the EPA’s risk management range of <math>1 \times 10^{-4}</math> to <math>1 \times 10^{-6}</math> cumulative excess lifetime cancer risk (ELCR) and hazard index (HI) less than or equal to 1. <sup>3</sup></p> <p>During June 2020, TDEC provided comments on preliminary draft WAC information provided by DOE. During September and October 2020, TDEC met with DOE and EPA to reiterate key concerns expressed in the EMDF Proposed Plan. In particular, TDEC reminded DOE that state acceptance of the preferred alternative—building and operating EMDF at CBCV Site 7c—relies heavily on consideration of site-specific data, assumptions, and exposure scenarios used to develop WAC for radionuclides and other contaminants.</p> <p>TDEC repeated its intent to evaluate whether WAC meet CERCLA requirements, Remedial Action Objectives (RAOs), and performance objectives in Tennessee Division of Radiological Health (DRH) rule 0400-20-11-.16. TDEC highlighted the need to evaluate potential toxic effects of uranium in addition to potential cancer risks associated with exposure to isotopes of uranium and other radionuclides.<sup>4,5</sup> As explained in an enclosure with TDEC’s October 15, 2020 letter, DOE has not provided a basis for analytic WAC development that satisfies the CERCLA threshold criterion for protectiveness. Moreover, DOE has not developed WAC (or landfill wastewater discharge limits) that protect against the toxic effects of uranium or non-radiological contaminants.</p> <p>Despite a commitment from DOE Headquarters technical review managers to work with TDEC to resolve WAC concerns, that effort was delegated to the Oak Ridge Office of Environmental Management (OREM), which deferred the effort. TDEC advocated for WAC resolution discussions on a regular basis, but DOE elected to defer those conversations. Despite TDEC’s position that protective WAC comprise a key concern to be resolved before ROD signature, recognizing that implementation details may be addressed in a post-ROD WAC compliance plan, DOE representatives periodically said DOE would discuss WAC after the D1 ROD was issued and/or that protective WAC would be finalized after the FFA Parties signed a ROD.</p> | <p>protectiveness of the WLCL is further discussed in the response to Comment 70 and in Sect. 2.12.2.3 of the D2 ROD.</p> <p>Administrative WAC are imposed on the generators as well, most of which were provided in the D1 ROD with some updates in the D2 version. Administrative WAC provide protectiveness through prohibitions on waste types, physical form, concentrations (e.g., Class C limitations for radionuclides), and RCRA designations (e.g., mercury hazardous waste [D009] is not allowed to be disposed of in EMDF).</p> <p>In addition to those WAC, Landfill Inventory Limits (LFILs) for radionuclides constrain waste receipts for the EMDF, but are not a total radioactivity limit provided to the generators; rather, these limits are held and tracked by the WAC Compliance Team for the landfill, tasked with monitoring the cumulative inventory relative to LFIL and accepting waste for disposal. Tier 1 radionuclides (mobile radionuclides) were assigned LFILs as provided in the D1 ROD. The basis for CERCLA protectiveness of the LFIL is explained in the response to Comment 36 and in Sect. 2.12.2.3 of the D2 ROD.</p> <p>LFILs are used to maintain protectiveness because the actual inventory will deviate from the projected inventory. LFILs allow radionuclide contaminants that are accepted for disposal to be “summed” or tracked (usually by a sum of fractions method) progressively as the inventory is maintained within the CERCLA risk range to its final state when the landfill is full. Initially the projected inventory is used to demonstrate protectiveness is attained; as actual waste is accepted for disposal, the inventory gradually converts to the “actual” inventory, which will be different from the projected inventory. LFILs are necessarily set higher than the projected inventory to allow for radionuclide-specific deviations to occur during “conversion” from</p> |

|          |             |               | <p>A letter from OREM to TDEC dated February 4, 2021 (revised March 8, 2021 with no date change) states “the CERCLA process is a separate regulatory path from the DOE O 435.1 process that ensures protectiveness through the PA and CA evaluations, and the development of the WAC will be addressed with the FFA Parties outside of DOE O 435.1 efforts.” At that time, the D1 ROD was schedule for submittal on July 12, 2021.</p> <p>During May, July, August, and September 2021, DOE hosted several 60- to 90-minute sessions during which TDEC proposed approaches to develop WAC that satisfy CERCLA’s protectiveness criterion in a defensible and transparent manner. The goal of TDEC’s recommendations was to derive WAC shown to be protective for groundwater and surface water within EPA’s risk management range of <math>1 \times 10^{-4}</math> to <math>1 \times 10^{-6}</math> cumulative ELCR and HI less than or equal to 1.<sup>3</sup> Currently agreement has not been reached on modeling scenarios needed to set protective WAC inventory limits.</p> <p>d. DOE Assessments<br/>                     Separate from CERCLA, DOE Orders require completion of a Performance Assessment (PA) to predict the proposed landfill’s ability to protect the public from radionuclide releases in the first 1,000 years following landfill closure (capping). DOE Orders also require completion of a Composite Analysis (CA) to evaluate the potential combined effects of multiple contaminant sources.</p> <p>DOE completed these technical assessments and used the PA results to develop WAC for radionuclides in accordance with DOE Orders. DOE Headquarters issued a Preliminary Disposal Authorization Statement (PDAS), authorizing construction of EMDF for the disposal of radiological waste. Although the PA and CA are not CERCLA documents, DOE included them in the CERCLA Administrative Record at TDEC’s request because the state evaluated findings from these documents to inform a CERCLA decision on the proposed landfill.</p> | <p>projection to actual.</p> <p>DOE has agreed with TDEC to conduct a supplemental analysis based on alternate assumptions regarding future landfill performance and exposure pathways. This supplemental analysis and results will inform development of the WAC Compliance Plan and landfill design. If additional LFILs are developed, these will be reported in the WAC Compliance Plan, which is a post-ROD, FFA primary document. This post-ROD approach is described in the WAC Fact Sheet for the public engagement that was reviewed and approved by the FFA parties.</p> <p>RCRA hazardous waste is required to ensure a HI of 1 is not exceeded. Additional demonstration/evidence of this is provided in Sect. 2.7 of the ROD. Also, see response to Comment 36.</p> <p>d. Comment noted; no response required.</p> |

|          |             |               | <p>TDEC’s evaluation of the PA/CA is also part of the Administrative Record. While the work documented in those reports was sufficient to obtain a PDAS from DOE Headquarters, TDEC found additional work is needed to develop WAC meeting CERCLA requirements, as described in subsequent comments below.</p> <p>e. Mercury Disposal<br/>                     DOE plans to dispose of demolition waste from Y-12 in the proposed EMDF. Mercury contamination within Y-12’s WEMA is the greatest known environmental risk on the ORR, according to the <i>Strategic Plan for Mercury Remediation at the Y-12 National Security Complex Oak Ridge, Tennessee</i> (DOE/OR/01-2605&amp;D2/R1). The state is concerned about disposal of waste from Y-12 because of its potential to release mercury into landfill wastewater discharged into Bear Creek.</p> <p>Fish in Bear Creek and downstream in East Fork Poplar Creek already contain excessive mercury. Both streams are included on Tennessee’s list of impaired and threatened waters, known as “the 303(d) list,” in part because of elevated concentrations of mercury. Bear Creek is impaired by mercury levels in fish tissue. Both streams are posted by the state to discourage fish consumption.</p> <p>From a public health perspective, the greatest potential threat of mercury disposal in the EMDF would be increased risks to people who eat fish caught downstream. The ROD must describe how the FFA Parties will manage mercury disposal to comply with the intent of the Tennessee Waste Quality Control Act (TWQA) and the state’s Antidegradation Statement (Tenn. Comp. R. &amp; Regs. § 0400-40-03-.06) and avoid adverse impacts from eating fish caught downstream of EMDF landfill wastewater discharges.</p> <p>DOE’s D2 <i>Focused Feasibility Study for Water Management for the Disposal of CERCLA Waste on the Oak Ridge Reservation, Oak Ridge, Tennessee</i> (DOE/OR/01-2664&amp;D2) predicted high concentrations of mercury in landfill leachate, ranging between 10,000 and 90,000 parts per trillion (ppt) [see p. E-14]. Although the calculations depended on a mercury disposal strategy DOE termed <i>macroencapsulation within the landfill cell</i> that is no longer proposed for use, TDEC remains concerned that disposal of large volumes of nonhazardous mercury wastes within EMDF could create concentrations of mercury in landfill wastewater that overwhelm the</p> | <p>e. Clarification provided. Bear Creek is listed as impaired for mercury because of fish tissue methylmercury concentrations (not the concentration of mercury in Bear Creek surface water, which is below the lowest Hg water quality criteria [WQC] for recreational use of a stream of 0.051 µg/L). Over the last several years, the mercury concentrations in fish, in Bear Creek, have been declining; however, they remain above the EPA criterion of 3 mg/kg.</p> <p>The FFA parties have reached agreement about mercury being introduced to Bear Creek through EMDF. The agreement has four elements documented in the D2 ROD:</p> <ol style="list-style-type: none"> <li>1. It addresses conducting further actions in the Bear Creek watershed, if the stream is still considered impaired because of the fish tissue methylmercury criterion at the time EMDF operations begin.</li> <li>2. Mercury hazardous waste (D009) will not be disposed of in EMDF (documented in the ROD through the Administrative WAC, see Table 2.4).</li> <li>3. Water treatment will be used to maintain the mercury in landfill wastewater effluent below the 0.051 ug/L recreational WQC for mercury.</li> <li>4. All recoverable elemental mercury from ORR CERCLA cleanup activities will be stored and/or disposed of offsite, subject to availability of a disposition pathway, as specified in project specific documentation.</li> </ol> |

|----------|-------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |               | <p>treatment system capacity and result in exceedances of mercury discharge limits. Accordingly, DOE should consider application of treatment technologies that decrease the toxicity and/or mobility of nonhazardous mercury waste to ensure discharge limits remain attainable and to protect the receiving stream. Application of such treatment technology to nonhazardous mercury waste would reflect CERCLA’s preference for a remedial action that “permanently and significantly reduces the volume, toxicity, or mobility of the hazardous substances, pollutants, and contaminants” [42 U.S.C. § 9621(b)].</p> <p>Currently, the FFA Parties are collaborating to develop and agree on an approach for managing mercury discharges to Bear Creek.</p> <p>f. Underdrains<br/>                     Tennessee does not allow drainage features to permanently suppress the water table at proposed landfill sites. This is consistent with Tennessee rules, including Tenn. Comp. R &amp; Regs. §§ 0400-11-01-.04(3), 0400-11-01-.04(4)(a)(2), 0400-20-11-.16(5), and 0400-20-11-.17(1)(h). Failure of such underdrains could make the landfill less stable and allow water into the waste. Underdrains also provide routes for any leakage to escape quickly. Either problem could result in contamination of local streams.</p> <p>The D1 ROD distinguishes between <i>permanent</i> underdrains the landfill design would rely on at some of the onsite disposal locations evaluated previously and <i>temporary</i> drainage features to be used during construction and operation at CBCV Site 7c. Revise the text to include a clear statement that temporary drainage features will only be used to control surface water, perched groundwater, and infiltration. The ROD should also state that EMDF will not rely on drainage features under the waste, including underdrains to permanently suppress the water table.</p> <p>g. Landfill Wastewater Discharge Limits<br/>                     The ROD must establish discharge limits for radionuclides and other chemicals in landfill wastewater, consistent with CERCLA and the EPA Administrator’s DRD. This is necessary to comply with TWQA regulations and to protect people using downstream water for recreational activities, including fishing. The FFA Parties are working to establish such limits and develop consensus on how to manage the landfill wastewater. General</p> | <p>f. Agree. Sect. 2.12.1 6th bullet was revised in response to this comment (and Comments 52 and 63) to state the following: “Permanent underdrains are not required to control the groundwater table. Underdrains will not be used as corrective actions for groundwater intrusion into the geologic buffer. although temporary drainage features, including underdrains, may be necessary to divert surface water, perched groundwater, and infiltration from excavations and improve ground conditions to aid construction. The absence of underdrains is critical to the state’s acceptance of this remedy. Should different conditions arise in the future, any consideration of a proposal for an underdrain as defined by agreement of the FFA parties would be considered to fundamentally alter the remedy in performance and scope, requiring a ROD amendment per 40 <i>CFR</i> 300.435(c)(2)(ii). ”</p> <p>g. The specific remediation goals for landfill wastewater are specified in the D2 ROD (Sect. 2.12.2.3). The approach was agreed upon among the FFA parties. The discharge limits will be developed in the future, based on the remediation goals, when the specifics of the EMDF landfill wastewater treatment systems are known, including the discharge location. The remediation goals are, and future discharge limits will be, within the CERCLA risk range and protective of</p> |

|          |             |               | <p>Comment 9 provides additional detail on TDEC’s position.</p> <p>Despite general guidance provided by the EPA Administrator’s DRD, the FFA Parties have reached an impasse in efforts to agree on a process for establishing landfill wastewater discharge limits in accordance with CERCLA.</p> <p>h. Although DOE opened a public comment period from September 2018 into January 2019 and hosted a public meeting and information sessions, the FFA Parties agreed additional public involvement will help address public concerns about information developed or updated since that time.</p> <p>DOE will provide updated information on the following topics.</p> <ul style="list-style-type: none"> <li>• WAC</li> <li>• Landfill wastewater discharge limits</li> <li>• Site selection               <ul style="list-style-type: none"> <li>○ Groundwater levels (TM-1 and TM-2)</li> <li>○ GWFD and associated landfill design basis (ROD Section 2.14.3)</li> <li>○ ARAR waivers and exemptions.</li> </ul> </li> </ul> <p>Information will be provided online and presented in a virtual public meeting in concert with a 30-day public comment period.</p> <p><sup>3</sup> Although EPA’s risk management range is 10<sup>-4</sup> to 10<sup>-6</sup> cumulative ELCR and the all-pathways dose assessment is allowed to meet EPA’s 10-mrem/year dose limit, it is TDEC’s position that evaluations of the groundwater-to-surface-water pathway used to develop WAC must meet a cumulative ELCR of 10<sup>-5</sup>. This is based on TDEC’s interpretation of the DRD issued by the EPA Administrator on December 31, 2020 and compliance with Tenn. Comp. R &amp; Regs § 0400-20-11-.16(2)[10 CFR 61.41], which will be an EMDF ARAR.</p> <p><sup>4</sup> The toxicity of depleted uranium to be disposed in EMDF poses about four times more risk of health (kidney) effects than its cancer-causing (radiological) effects, based on CERCLA guidance and the cancer risk threshold of 1 × 10<sup>-5</sup> ELCR applied to surface water by the state of Tennessee.</p> <p><sup>5</sup> Neptune and Company, Inc., 2019, <i>Comparison of Uranium Water Criteria Derived on the Basis of Radiological Dose, Radiological Cancer Risk, and Chemical Toxicity</i>, Technical Memorandum, March 8.</p> | <p>Human Health and the Environment.</p> <p>h. Comment noted, no response required.</p> |

| E        | 4           |            | <p><b>Remedial Investigation/Feasibility Study (RI/FS)</b></p> <p>a. The RI/FS was not approved by EPA nor the state and is therefore not a final document. Ensure this is clarified in all references to the RI/FS.</p> <p>b. Should references to the Remedial Investigation/Feasibility Study (RI/FS) cite the 2018 “errata” version of the fifth (D5) draft of the RI/FS instead of the 2017 version?</p>                                                                                                                                                                                                                                                                                                                                                   | <p>a. Clarification provided. Text revised to clarify in Sect. 1.2 (first discussion of RI/FS). The following text has been added:</p> <p>Although the RI/FS (D5 version, submitted in spring of 2017) was not formally approved by EPA or TDEC, the three agencies agreed to move forward with the Proposed Plan. On December 7, 2017, a formal dispute agreement was entered into by the three parties, which addressed the issues of siting, applicable or relevant and appropriate requirements, and waste acceptance criteria, and concurred on submitting a Proposed Plan that would identify the Central Bear Creek Valley as the preferred location for an onsite disposal facility.</p> <p>b. Clarification provided. The reference to the 2017 D5 RI/FS is correct. The full reference will note an erratum version exists.</p> |
| E        | 5           |            | <p><b>Waste/Groundwater Separation</b></p> <p>As noted in Section 1.3 (p. 1-5) and Section 2.8 (p. 2-17), the ROD will include the following RAO:</p> <p>Maintain a 15-ft separation between the bottom of emplaced waste and the seasonal high-water table of the uppermost unconfined aquifer, which includes 5 feet (ft) of liner system and 10 ft of geologic buffer consistent with TDEC 0400-11-01-.04(4)(a)(2).</p> <p>Language citing a 15-ft unsaturated zone should be revised for consistency with this wording. Examples include p. 1-5 (last bullet), p. 2-37 (first bullet), p. 2-38 (second paragraph in Section 2.12.2.1), p. 2-53 (middle and last paragraphs), p. 2-54 (first sentence), and p. 2-60 (first paragraph in Section 2.14.3).</p> | <p>Agree. The last bullet on p. 1-5 is correct; the text in the following locations has been modified to be consistent:</p> <p>p.2-37 (first bullet in Sect. 2.12.2)</p> <p>p.2-38 (second par. Sect. 2.12.2.1)</p> <p>p. 2-53/54 (Sect. 2.13.2.2, 3<sup>rd</sup> par. and 4<sup>th</sup> par.)</p> <p>p. 2-60 (1<sup>st</sup> par. Sect. 2.14.3)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| L        | 6           |               | <p><b>Land-Use Designation</b><br/>           The D1 ROD makes several references to the need to amend the future land-use designation of Bear Creek Valley (BCV) Zone 2 from “recreational” to “DOE-controlled industrial.” Does the BCV Phase I ROD also need to be amended to reflect this change?</p>                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Clarification provided. The FFA managers will address the need to update the BCV Phase I ROD.</p> <p>The BCV Phase I ROD states that subsequent CERCLA decisions for BCV may establish a basis for revision to the land uses defined for cleanup goal establishment.</p> <p>The BCV RAR CMP will require changes based on the zone changes being made in this ROD. Text has been added to Sect. 1.2 to note changes are required to the BCV RAR CMP. Additionally, a CERCLA Waste Disposal LUCIP (for EMWMF) exists and is referred to in the text, either to be updated to include EMDF or a similar stand-alone document will be developed and attached to the EMDF RDR.</p> |
| S        | 7           |               | <p><b>Bear Creek Valley Wells</b><br/>           The ROD mentions “hundreds of wells in Bear Creek Valley” on p. 2-3, 2-12, 3-75, 3-106, 3-140, 3-145, 3-152, 3-161, 3-178, 3-195, 3-196, and 3-200. Wells and other borings throughout the valley provide valuable information relevant to understanding the regional hydrogeological setting, but they do not substitute for the data collected at the CBCV site. The site-specific data collected for TM-1 and TM-2 indicate the natural position of the water table is up to 30 ft higher than anticipated by the conceptual model presented in the draft RI/FS reports. This revelation highlighted the need for the GWFD described in Section 2.14.3 of the D1 ROD.</p> | <p>Clarification provided. As noted, the hundreds of wells in Bear Creek Valley provided the hydrogeologic basis for selecting the CBCV site. Site-specific data will be used in developing the engineering design. No change to the text is necessary.</p>                                                                                                                                                                                                                                                                                                                                                                                                                       |

|----------|-------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A<br>E   | 8           |               | <p><b>Landfill Wastewater Definitions</b><br/>           The ROD should be revised to apply a legally correct definition for landfill wastewater, as provided in 40 CFR 445.2(f), which should be included in the ROD as an ARAR.</p> <p>The rule defines landfill wastewater as follows:</p> <p>(f) Landfill wastewater means all wastewater associated with, or produced by, landfilling activities except for sanitary wastewater, non-contaminated storm water, contaminated ground water, and wastewater from recovery pumping wells. Landfill wastewater includes, but is not limited to, leachate, gas collection condensate, drained free liquids, laboratory derived wastewater, contaminated storm water and contact wash water from washing truck, equipment, and railcar exteriors and surface areas which have come in direct contact with solid waste at the landfill facility.</p> <p>The ROD should use the term “landfill wastewater” instead of “wastewater” for consistency with this legal definition. The ROD includes incorrect terminology at locations including, but not necessarily limited to the following:</p> <ul style="list-style-type: none"> <li>• <u>p. 2-11: 2<sup>nd</sup> paragraph</u> (revise “clean water” to “non-contaminated stormwater”)</li> <li>• <u>p. 2-18: 4<sup>th</sup> paragraph after the bullets</u> (“contact water”)</li> <li>• <u>p. 2-38: 4<sup>th</sup> and 5<sup>th</sup> paragraphs in Section 2.12.2.1</u> (“contact water” &amp; “wastewater”)</li> <li>• <u>p. 2-39: 3<sup>rd</sup> paragraph under Phase 1 Construction</u> (“contact water”)</li> <li>• <u>p. 2-56: 2<sup>nd</sup> paragraph on the page</u> (“contact wastewaters”).</li> </ul> | <p>Disagree. The citation, 40 <i>CFR</i> 445.2(f) is not a substantive requirement and therefore is not included as an ARAR. The definition of landfill wastewater, as used in this ROD, is compliant with the definition given at 40 <i>CFR</i> 445.2(f) and therefore the definition has been included in Sect. 2.9.2 of the ROD.</p> <p>Agree. Modifications to the text referring to ‘contact water’ have been made.</p>                                                                                                                                                                                                                                                                      |
| D        | 9           |               | <p><b>Landfill Wastewater Treatment: TDEC Position</b><br/>           The FFA Parties have committed to ensuring this ROD establishes protective discharge limits for releases of contaminated landfill wastewater from the proposed EMDF and discharging into nearby waterways. A lot of ground has been covered on this issue over the past few years. Most recently, the EPA Administrator issued a DRD concerning radiological discharge limits. Limits are also needed for the discharge of other chemicals, including but not limited to mercury and polychlorinated biphenyls (PCBs).</p> <p>The DRD directly addresses the development of radionuclide limits for landfill wastewater discharges into Bear Creek from EMWMF and the proposed EMDF, and it clearly directs the FFA Parties to establish limits based on site-specific conditions in Bear Creek. The decision also clearly cites the relevance of</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Clarification provided. An FFA Party working team was established in early 2021 following receipt of the EPA Administrator’s dispute resolution decision. This working team has come to consensus on the exposure scenarios to protect human health and the environment in Bear Creek.</p> <p>The FFA parties reached agreement on treatment of all landfill wastewater from EMDF. The most appropriate treatment methodologies will be determined as part of the remedial design; however, an initial flocculation and chemical precipitation step is expected to remove the common radionuclides expected to be present in waste disposed at EMDF. As described in Sect. 2.12.2.4 of the</p> |

|          |             |               | <p>ARARs such as the Clean Water Act (CWA) and NRC regulations when establishing the site-specific limits. For instance, the decision states, “EPA supports the DOE’s application of the <i>as low as reasonably achievable</i> [ALARA] approach within the relevant and appropriate NRC regulations to ensure that application of a NRC regulation also achieves a risk level no less stringent than 10<sup>-5</sup>.”</p> <p>DOE is currently leading an effort with EPA and TDEC to examine and understand how site-specific conditions in Bear Creek affect potential discharge limits. For example, the team has collected data suggesting the number of fish <i>currently</i> in the upper sections of Bear Creek may not support default assumptions found in a standard recreational fishing scenario for fish ingestion. These findings might be interpreted to suggest a higher level of contamination could be discharged into Bear Creek than would normally be acceptable using default CERCLA risk assessment assumptions. In addition, the EPA Administrator recommended the acknowledgement of land-use designations during the development of discharge limits. Because DOE currently controls the land in some of the same areas where fish availability does not presently support default fishing assumptions, development of site-specific discharge limits related to exposure assumptions for these areas appears appropriate. However, for portions of Bear Creek in areas where DOE does not control the land use (e.g., unrestricted land use) and where past studies document actual fishing, it would be inappropriate to develop discharge limits based on alterations of default fishing assumptions.</p> <p>Although TDEC can generally support the establishment of discharge limits based in part on site-specific conditions in portions of Bear Creek, TDEC does not prefer the single approach of modifying default assumptions throughout Bear Creek in areas controlled by DOE and areas outside DOE control (which have known fishing). Instead, TDEC recommends a multi-faceted approach for protection of environmental resources and the health of people who eat fish caught downstream.</p> <p>It is TDEC’s position that landfill wastewater treatment could be adopted for protection of both portions of Bear Creek—i.e., those where DOE does not control the land use as well as those where land use is currently restricted, and it would avoid needless, protracted arguments when there is lack of scientific certainty to establish site-specific risk assumptions. As described in TDEC’s July 23, 2021 letter,<sup>6</sup> although the EPA Administrator’s DRD did not specifically apply the CWA technology-based approach to the Bear Creek</p> | <p>D2 ROD, additional treatment capabilities will be in place for use, as needed, to treat additional radionuclides.</p> |

|----------|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|          |             |               | <p>decision, treatment of landfill wastewater is consistent with the DRD when discussing the NRC ALARA approach <u>and</u> the preference for water treatment in the CWA and CERCLA. Both facets should be used to develop protective discharge limits: adjusting standard default assumptions (e.g., fish consumption rates) for areas controlled by DOE and landfill wastewater treatment to protect downstream users.</p> <p>In recent discussions with EPA and TDEC, DOE appears to embrace the position that the landfill wastewater would only require treatment if it does not meet the to-be-established discharge limits after the site-specific conditions are considered. In addition, DOE is recommending the modification of default exposure assumptions for areas of the stream flowing through property not controlled by DOE. DOE bases these recommendations on current fish availability in the stream and recent sampling results for contaminants in fish downstream in Bear Creek. While TDEC acknowledges the value of these results for evaluating past discharges of contamination from other sources in BCV (e.g., EMWMF and Bear Creek Burial Grounds [BCBG]), TDEC questions the reliability of this data to predict future fish tissue contamination originating from EMDF releases. The EMDF will receive the bulk of its waste from ORNL and Y-12 instead of the former K-25 site at the East Tennessee Technology Park (ETTP). Moreover, the EMWMF has discharged only a fraction of the total allowable DOE limits.</p> <p>Again, TDEC does not concur with DOE's recommended, single-faceted approach for establishing radiological discharge limits. TDEC is confident that when a reasonable treatment methodology is defined in the EMDF ROD and implemented along with site-specific assumptions for Bear Creek fish consumption scenarios, the FFA Parties should have little trouble agreeing upon final discharge limits that are protective at the point of exposure described in the Administrator's decision. TDEC believes agreement on appropriate treatment will allow quick resolution of this issue while continuing to move the project forward.</p> <p>Therefore, the FFA Parties should immediately begin discussing appropriate treatment methodologies for the contaminants planned for EMDF disposal which would exceed human health risk criteria for a recreational user with default risk assessment assumptions in portions of Bear Creek. Clearly, the FFA Parties should utilize the flexibility provided by site-specific conditions (e.g., modified fish consumption rates for stream locations with limited fish populations controlled by DOE) while evaluating regulatory compliance at the</p> |          |

|          |             |               | <p>EMDF. However, site-specific conditions should be used with appropriate treatment, not instead of treatment.</p> <p>A version of ion exchange treatment using media such as resins is the generally accepted approach for removing radiological constituents prior to discharge. DOE has and continues to use such wastewater treatment methods across the ORR and can lead the discussion of appropriate treatment media for radionuclides projected to be disposed in the EMDF.</p> <p><sup>6</sup> TDEC Comment Letter: <i>Focused Feasibility Study for Water Management for the Disposal of CERCLA Waste on the Oak Ridge Reservation, Oak Ridge, Tennessee</i> (DOE/OR/01-2664&amp;D3), July 23, 2021; available at <a href="https://doeic.science.energy.gov/uploads/F.0600.029.0856.pdf">https://doeic.science.energy.gov/uploads/F.0600.029.0856.pdf</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| D        | 10          |               | <p><b>Landfill Wastewater Treatment: Text Inconsistencies</b></p> <p>Consistent with the previous comment, the EMDF ROD must commit to the full treatment of radionuclides and hazardous/toxic chemicals in all EMDF landfill wastewater using technologies agreed by the FFA Parties. Treated effluents should be managed consistent with state regulations prohibiting bypasses—e.g., Tenn. Comp. R. &amp; Regs. § 0400-40-05-.07(2)(1).</p> <p>Active treatment of all landfill wastewater is necessary to meet the CERCLA criterion requiring reduction of toxicity, mobility, or volume through treatment. A commitment to treat the landfill wastewater in this manner would protect Bear Creek and people who use the stream for its designated recreational use, including the consumption of fish caught downstream of EMDF. A documented commitment to appropriate treatment would also facilitate resolution of this long-standing impediment to progress on a CERCLA decision for the proposed EMDF.</p> <p>The D1 ROD provides inconsistent information regarding DOE’s plans for landfill wastewater treatment. Section 2.12.2.4 (p. 2-46, second paragraph) states EMDF landfill wastewater may be discharged directly to Bear Creek or a tributary <i>without</i> treatment. However, other parts of the document contradict this statement by stating landfill wastewater will be treated. Examples include, but may not be limited to, the following.</p> <p>a. <u>Table 2.1, p. 2-22 &amp; 2-23, Reduction of toxicity, mobility, or volume through treatment</u>: For all onsite waste disposal alternatives, including the</p> | <p>See response to Comment 9.</p> <p>This paragraph was revised to state “Landfill wastewater from EMDF, defined as landfill leachate and contaminated stormwater (also referred to as contact water), will be collected in a series of tanks prior to treatment. Landfill wastewater from EMDF will be treated prior to discharge to ensure it is protective of recreational use (human health), specifically fish ingestion.”</p> <p>a. Noted. No change needed.</p> |

|----------|-------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |               | <p>remedy proposed for selection, the table entry indicates landfill wastewater treatment would reduce contaminants to levels required for discharge. TDEC agrees and notes this is not consistent with the statement on p. 2-46.</p> <p>b. <u>Section 2.10.4, p. 2-26, 3<sup>rd</sup> paragraph</u>: This paragraph states onsite waste disposal would reduce contaminant levels by treating landfill wastewater. This is not consistent with the statement on p. 2-46. TDEC requests the addition of the following sentence to the paragraph: "Discharges from the site will be treated to ensure state use classifications for the receiving water bodies are not affected."</p> <p>c. <u>Section 2.13.3, p. 2-55, 1<sup>st</sup> paragraph</u>: The last sentence in the paragraph states the overall remedy effectiveness is determined in part by its ability to meet the CERCLA criterion for reduction in toxicity, mobility, or volume. TDEC agrees and notes this is not consistent with the statement on p. 2-46.</p> <p>d. <u>Section 2.13.5, p. 2-56, 1<sup>st</sup> full paragraph on page</u>: The text is not consistent with the statement on p. 2-46.</p> | <p>b. Clarification provided. This paragraph describes reduction of toxicity, mobility, or volume through treatment and is appropriate as written by stating landfill wastewater treatment to meet ARARs would reduce contaminants to levels required for discharge to Bear Creek or its tributaries. This section does not describe treatment goals.</p> <p>Consistent with the FFA party agreement, the paragraph on pages 2-2 and 2-46 was revised as follows: "Landfill wastewater from EMDF will be treated prior to discharge to be protective of recreational use (human health), specifically fish ingestion."</p> <p>c. See response to Comment 10b.</p> <p>d. This paragraph is consistent with the reworded statement on page 2-46 (see response to Comment 10b).</p> |
| D        | 11          |               | <p><b>Monitoring of Bear Creek Fish, Surface Water, and Sediment</b></p> <p>Considering the assessment of potential future risks posed by discharges of radioactive landfill wastewater from the EMWMF and EMDF, the EPA Administrator's DRD finds: 1) the individual with the potential maximum exposure to radionuclides in landfill wastewater would be a recreational fisherman who fishes Bear Creek and 2) default assumptions regarding fish consumption, and perhaps other default assumptions, do not represent reasonable maximum exposure at ORR. Based on those findings, the DRD directs DOE to complete fish tissue studies to support the development of preliminary remediation goals (PRGs) to support the establishment of discharge limits for radionuclides in landfill wastewater.</p>                                                                                                                                                                                                                                                                                                                                                                 | <p>Clarification provided. As discussed in the FFA Party working team meetings, Bear Creek drains an area containing other legacy contamination sites. Therefore, it would be more appropriate to conduct this monitoring as part of the BCV Comprehensive Monitoring Plan and report the data in the annual Remedial Effectiveness Reports.</p> <p>Two sampling events were completed in 2021, the Spring sampling noted, and an additional Fall sampling event. These data provide the baseline conditions as described in the comment. Future monitoring plans and approaches</p>                                                                                                                                                                                             |

| Category | Comment No. | Sect/<br>Page | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Response                                                                                                                                                                            |
|----------|-------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |               | <p>There are uncertainties regarding actual risks to people who will eat fish caught downstream of the EMWMF and EMDF landfill wastewater discharges. Therefore, it is TDEC’s position the EMDF ROD should commit to the implementation of a program to routinely monitor levels of radionuclides and other contaminants, such as mercury and PCBs, in Bear Creek fish tissue, surface water, and sediment. The program would provide a straightforward way to demonstrate compliance with Tenn. Comp. R. &amp; Regs. § 0400-40-07-.04(7)(a), which will be an ARAR in the ROD.</p> <p>At a minimum, the program should continue throughout the operational period of the landfills, and the results should be presented at the appropriate frequency in the annual Phased Construction Completion Reports (PCCRs) for the landfills. Upon closure of each landfill, the FFA Parties will evaluate the data and agree upon any warranted post-closure monitoring.</p> <p>DOE already completed an initial monitoring effort in the summer of 2021. The results and those from additional samples collected before EMDF begins discharging landfill wastewater should be used to establish baseline conditions, against which data from the future monitoring should be compared.</p> | <p>should take into account how to safeguard the fish population in Bear Creek while still collecting appropriate data for comparison to the baseline.</p>                          |
| O        | 12          |               | <p><b>DOE Directives and CERCLA</b><br/>         The ROD should document how CERCLA requirements are met by the remedy being selected, including the role of five-year reviews (FYRs) for as long as the EMDF site cannot be used in an unrestricted manner. The D1 ROD includes several references to DOE Directives and associated requirements, including a 1000-year post-closure performance period evaluated by the PA. TDEC recognizes DOE requires compliance with DOE Directives, but the Directives, performance period, and PA dose metrics are not necessarily consistent with CERCLA requirements. If the ROD includes references to non-CERCLA requirements that are not ARARs, it should accurately reflect these requirements are not intended to demonstrate compliance with CERCLA.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Clarification provided. The 5-yr reviews are discussed at the end of Sect. 1.5, in Sect. 2.12.2.3, and in Sect. 2.13.6 (this section is now titled “CERCLA 5-Year Reviews”).</p> |

| Category | Comment No. | Sect/<br>Page | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| O        | 13          |               | <p><b>Safety</b><br/>           The D1 ROD includes numerous references to the ability to “safely” operate and dispose of waste in the EMWMF and proposed EMDF landfills. As stated correctly in Section 2.13.2 (p. 2-50), requirements for a CERCLA ROD are designed to protect the environment and the public. This is separate from and does not include compliance with occupational safety requirements, which is required independently and regulated by the Occupational Safety and Health Administration (OSHA), not TDEC or EPA. Revise the language to focus the ROD more clearly on compliance with CERCLA criteria.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>Clarification provided. Text was revised where appropriate; there were two instances where the CERCLA terminology of protectiveness was more appropriate than was the term “safe” or “safely” (many of which were in the public comments or ARARs text). The use of the terms ‘safe’, ‘safely’, or ‘safety’ throughout the ROD is intentional to demonstrate that DOE is committed to safely carrying out the work they do. In addition, DOE believes that the ROD appropriately and adequately addresses compliance with CERCLA.</p>                                                            |
| O        | 14          |               | <p><b>Waste Minimization</b><br/>           The D5 draft RI/FS (p. ES-6) states the ROD will contain a commitment to waste minimization if an onsite disposal alternative is selected. The proposed plan (p. 13) also includes this assurance. Language in Section 2.12.2.4 (p. 2-46) of the D1 ROD falls short of a commitment, stating:</p> <p style="padding-left: 40px;">Sequencing of waste generation, as much as possible, will be a priority to reduce the amount of clean fill required by using contaminated soil waste as fill during the disposal of debris waste. Segregating waste at the generator site and maximizing recycling also will be used. This ROD has a goal for all waste-generating projects to maximize waste minimization.</p> <p>TDEC appreciates prioritization of minimizing the disposal of clean material in the proposed EMDF. However, the ROD should clarify how a goal in the EMDF ROD meets the commitment when waste-generating projects are not within the scope of the EMDF ROD, as stated in Section 2.4 (p. 2-11).</p> | <p>Agree. Text below was added to Sect. 2.12.2.5.</p> <p>“DOE and its contractors implement a “waste disposal hierarchy” that initially evaluates a potential waste stream to see if all or part of it is eligible for reuse or recycling – eliminating it from requiring disposal. Waste remaining after that initial evaluation is characterized and profiled for disposal in an order from sanitary/industrial waste disposed on the Oak Ridge NPL Site, to onsite disposal of waste in the EMWMF (or EMDF), to offsite disposal at another DOE site, to offsite commercial waste disposal.”</p> |
| W        | 15          |               | <p><b>Offsite Waste</b><br/>           The EMDF should <u>not</u> accept wastes generated outside the Oak Ridge Reservation (USDOE) National Priorities List (NPL) site boundary, even if they were contaminated by the receipt or transport of material from past ORR operations. The EMDF CERCLA remedy is an onsite action to be conducted entirely within the ORR. Revise the text accordingly, including but not limited to the following:</p> <ul style="list-style-type: none"> <li>• Section 2.4, Page 2-11, 5<sup>th</sup> paragraph on page</li> <li>• Table 2.4, Page 2-41, 1<sup>st</sup> row in table</li> <li>• Section 2.13.2, Page 2-50, 4<sup>th</sup> paragraph in section.</li> </ul>                                                                                                                                                                                                                                                                                                                                                            | <p>Clarification provided. The text has been revised to indicate the ROD only permits wastes generated by CERCLA activities on the Oak Ridge Reservation (USDOE) NPL site to be disposed of in EMDF. However, the FFA parties, using the CERCLA process, could agree and approve to take any waste generated by past DOE activities off-ORR, but within the state of Tennessee.</p>                                                                                                                                                                                                                 |

Text revised as suggested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Part 1: Declaration</b> |             |                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| L                          | 17          | <u>Section 1.2, Page 1-3, last paragraph on page</u> | <p>a. The EMDF D1 ROD states the BCV ROD needs to be modified to change the land use. In conjunction with that effort, the EMDF ROD and BCV Phase 1 ROD must commit DOE to accelerating cleanup of other contaminant sources in BCV. As noted in TDEC’s April 17, 2019 letter to DOE, uranium contamination already exceeds risk-based levels in Bear Creek. The EMDF CA assumes future cleanups will resolve this problem by the time EMDF operations cease. Therefore, the EMDF and BCV RODs must commit DOE to achieving substantial cleanup of other BCV contaminant sources before EMDF closure. Accelerated timeframes for cleaning up contaminant sources in BCV must be reflected in the FFA (Appendices E and J). If appropriate, describe how the cleanups would support the antidegradation compliance approach (also known as the mercury strategy).</p> <p>b. The FFA Parties should discuss and agree upon a Zone 1 land-use designation. Regardless of the designated land use, the stream designation is determined by the Tennessee Board of Water Quality, Oil &amp; Gas.</p> <p>c. Revise the last sentence to clarify DOE prohibits fishing in the upstream portion of the Bear Creek watershed. It is not accurate to claim fishing is prohibited within the whole watershed. As stated in the previous sentence, fishing <i>advisories</i> exist for downstream portions of Bear Creek.</p> <p>State of Tennessee advisories against fish consumptions are not prohibitions. Available information indicates anglers catch and eat fish caught downstream of Bear Creek, which receives landfill wastewater discharged from EMWMF and is anticipated to receive landfill wastewater discharged from EMDF.</p> <p>The U.S. Department of Health and Human Services (1998) reports, “Most participants of an exposure investigation conducted for the Tennessee River portion of Watts Bar Reservoir continued to eat the same amounts and kinds</p> | <p>a. Clarification provided. The D1 ROD does not state the BCV Phase I ROD needs to be modified. Acceleration of cleanup is beyond the scope of this ROD document. TDEC has opportunity at the FFA annual cleanup meeting to address concerns voiced in this comment.</p> <p>See the response to Comment 6 about changes made to Sect. 1.2.</p> <p>b. This comment is addressed by the response to Comment 31a.</p> <p>c. The sentence refers only to Bear Creek to the east of Hwy 95. Additional text changes have been made to address fish advisories.</p> |

|----------|-------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |               | <p>of fish or turtles even when they were aware of the consumption advisories.”<sup>7</sup></p> <p>Campbell et al. (2002) found 48 percent (%) of the people interviewed believed the fish caught in the study area were safe to eat.<sup>8</sup> The study area included the Clinch River arm of Watts Bar Reservoir, downstream of Melton Hill Dam, and Poplar Creek up to the Blair Road access point. The survey found 90% of anglers fishing in Poplar Creek when interviewed had heard about the fish consumption warnings, and 40% thought the fish were safe to eat. Fewer than 5% of anglers who knew about the fish consumption advisories talked about limiting fish consumption. Similarly, Burger and Campbell (2010) found 38% of anglers ate fish they caught in the same survey area.<sup>9</sup></p> <p>d. Preventing fishing on Bear Creek within Zone 1 requires enforcement of land use controls. Currently, fishing would involve criminal trespass on restricted federal land. The ROD should clarify that any future decision to transfer ownership of land in Zone 1 would require reevaluating the remedy for risks associated with additional potential exposure pathways.</p> <p>e. The fishing advisory is not a “prohibition” because the nature is more of a warning than an enforceable restriction. Although <i>prohibition</i> is not defined, the advisory only warns through signage that leads to information describing contamination in the creek via a Quick Response (QR) code.</p> <p>If DOE has posted “No Trespassing” signs on its property, has it considered whether the signs are posted in accordance with Tenn. Code Ann. § 39-14-405 for state criminal prosecution of criminal trespass? Is there sufficient fencing in Bear Creek Valley west of Y-12 to constitute the element of “enclosed” property under 42 USC § 2278a? While these are criminal misdemeanors at state and federal levels, have charges ever been filed against trespassers in this area to enhance the deterrent effect? Are there systematic patrols in this area to look for trespassers?</p> <p>The threshold question to be answered before discussion of trespassing is ownership of the creek bed. The determination of ownership of the creek bed depends on navigability. There is little case law about this subject. Existing cases are generally old, but they have not been overruled. See Tennessee Attorney General’s Office, AG Opinion 11-75, October 21, 2011, and <i>State v. West Tenn. Land Co.</i>, 19 Cates 575,158 S.W. 746 (Tenn. 1913).</p> | <p>d. The ROD indicates there is no intention of transferring ownership of land in Zone 1, 2, or 3. See Sect. 2.12.2.8 about land use controls and requirements regarding transfer of ownership.</p> <p>e. Agree. However, DOE does prohibit fishing (via No Trespassing signage). There are daily patrols of Bear Creek Road beginning at Hwy 95 and moving east. This area is a buffer for Y-12, and is patrolled multiple times per day.</p> <p>Regarding the information provided by the commenter, Bear Creek, from the location at Hwy 95 to its head near the Y-12 facility and all tributaries feeding Bear Creek within that area, fulfill the statement: “But as to shallow streams, unfit for such purposes of transportation and commerce, both the right of property and use are wholly and absolutely in the owner of the adjoining lands.” Thereby allowing DOE to prohibit fishing in this portion of the BCV watershed. Notwithstanding, the recreational fisher scenario has been used hypothetically to demonstrate protectiveness after closure, and to calculate radiological discharge limits during operations.</p> |

|          |             |               | <p>The Tennessee Supreme Court dealt with ownership and use of streams by placing streams in the category of either navigable or non-navigable. The concept of navigability is further divided into navigable in the legal sense and navigable in the ordinary sense. The state owns the bed of streams that are navigable in the “legal sense” and “ordinary sense.”</p> <p>If the river be a public navigable stream, in the legal sense, the soil covered by the water, as well as the use of the stream, belongs to the public. But if ‘it be not navigable in the legal meaning of the term, — as is the case in England as to all streams above the flow of the tide — the ownership of the bed of the stream is in the riparian proprietors, but the public have an <i>easement</i> therein, for the purposes of transportation and commercial intercourse.’ A distinction is taken, by the common law, between streams which, in the common acceptance of the term, are suited to some purposes of navigation, and small, shallow streams which are not so. In respect to the former — which, though not navigable in the sense of the law, are yet of sufficient depth, naturally, for valuable floatage, as for rafts, flat-boats, and perhaps small vessels of lighter draft than ordinary, — while it is settled, that the right of property, in the bed of the stream, is vested in the riparian proprietor, and in that respect it is to be regarded as a private river; still it is equally well settled, that the public have a right to the free and uninterrupted use and enjoyment of such stream, for all the purposes of transportation and navigation to which it is naturally adapted. And this <i>easement</i>, or “servitude of public interest,” in the phrase of the Roman law, is as absolute and unlimited in the public, in reference to this class of rivers, as to rivers navigable in the technical meaning of the term.</p> <p><u>But as to shallow streams, unfit for such purposes of transportation and commerce, both the right of property and use are wholly and absolutely in the owner of the adjoining lands. Angel on Watercourses, §§ 535, 539, and authorities there—referred to 3 Kent’s Com. 411, 427.<sup>10</sup></u></p> <p>It is impossible to imagine Bear Creek as a navigable stream in either the legal or ordinary sense in its upper reach. Unless there is the servitude of public interest, the rights of ownership also carry the ability to exclusively possess the property and the ability to exclude others. So, the changes made in land use to “restricted recreational” are inherently part of its ownership of property. It is DOE’s prerogative to change its future plans for the property, but relevance of the land use change is doubtful. The risk from fishing is not managed by limiting access because the fish themselves have mobility, and</p> |          |

|          |             |               | <p>the contaminants bioaccumulate through the ecosystem, which knows no property boundary.<sup>11</sup></p> <p>There has also been a consideration of the extent of public access under the servitude. The recent case dealt with the right to float on the river in question and the right of portage, but it did not establish rights to wade in the stream and fish. It is the difference between floating on the water still owned by the public and touching the bottom in wading.<sup>12</sup></p> <p>The conclusion is that DOE likely can control access by obstruction, and any access would be made illegally and subject to penalties for trespassing.</p> <p><sup>7</sup> U.S. Department of Health and Human Services, 1998, <i>Serum PCB and blood mercury levels in consumers of fish and turtles from Watts Bar Reservoir, Watts Bar Reservoir/Clinch River Operable Unit, Oak Ridge Reservation (USDOE), Oak Ridge, Anderson County Tennessee, CERCLIS No. TN1890090003</i>, Atlanta, GA: Agency for Toxic Substances and Disease Registry, Division of Health Assessment and Consultation, Exposure Investigation and Consultation Branch.</p> <p><sup>8</sup> Campbell, K.R., Dickey, R., Sexton, R., and Burger, J., 2002, <i>Fishing along the Clinch River arm of Watts Bar Reservoir adjacent to the Oak Ridge Reservation, Tennessee: behavior, knowledge and risk perception</i>, Science of The Total Environment, v. 299, Issues 1-3, November, p. 145-161.</p> <p><sup>9</sup> Burger, J., and Campbell, K.R., 2008, <i>Fishing and consumption patterns of anglers adjacent to the Oak Ridge Reservation, Tennessee: higher income anglers ate more fish and are more at risk</i>, Journal of Risk Research, 11:3, 335-350, DOI: 10.1080/13669870701795560.</p> <p><sup>10</sup> <i>Stuart v. | O        | 18          | Section 1.2,<br>Page 1-4, 1 <sup>st</sup><br>sentence on page     | <p>The cited sentence (and a similar one on p. 2-33) states DOE removes beavers and their habitat from Bear Creek as a best management practice (BMP) to discourage fishing.</p> <p>a. Clarify whether DOE removes beavers and their habitat from the entirety of Bear Creek, or identify specific stream reaches. In either case, habitat destruction and wildlife removal do not comprise a BMP, particularly as a goal of an environmental cleanup program. Removal of contamination from the ecosystem is an example of a BMP. If removal of beaver dams is a part of the remedy, the ROD needs to provide further explanation regarding the rationale and implementation plans.</p> <p>b. Has DOE evaluated the ostensible merits of beaver habitat removal (discouragement of fishing) relative to the merits such habitat may provide (reducing downstream transport of mercury-contaminated sediment)?</p> <p>c. TDEC notes the practice of habitat alteration though beaver dam removal might need to comply with the substantive requirements of a general Aquatic Resource Alteration Permit (ARAP).</p> | <p>Clarification provided. The referenced sentence was removed from both Sects. 1.2 and 2.12 because it is not part of the remedy. Also note, almost all beaver dams in Bear Creek Valley east (upstream) of State Route 95 were removed naturally by the high surface water flows resulting from very wet winters in recent years.</p> |
| E<br>D   | 19          | Section 1.2,<br>Page 1-4, last<br>paragraph on page               | <p>a. Delete the term <i>permanent</i> from the first sentence. As CERCLA waste is disposed in the proposed EMDF, ongoing monitoring of EMDF discharges may cause the permanence of disposal of a problematic waste stream to be questioned.</p> <p>b. The waste disposal remedy selected in the ROD must address CERCLA's preference for cleanup through active treatment of all landfill wastewater, not just individual waste lot decisions in other CERCLA documents.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>a. Agree. The term was deleted.</p> <p>b. Agree. Treatment of landfill wastewater was added to the end of the section.</p>                                                                                                                                                                                                           |

|          |             |                                                       | <p>considered protective without a separate consideration of compliance with the risk range, except when there are multiple contaminants and pathways of exposure, which is the case for EMDF. For surface water the ARAR does not allow the full use of the risk range, capping risk to <math>1 \times 10^{-5}</math>, per the EPA Administrator's DRD.<sup>13</sup></p> <p><sup>13</sup> EPA, 1997, <i>Clarification of the Role of Applicable, or Relevant and Appropriate Requirements in Establishing Preliminary Remediation Goals under CERCLA</i>, OSWER 9200.4-23, August 22.</p> | <p>the environment as a threshold criterion. CERCLA and the NCP measures protectiveness through use of a risk range. This bullet addresses protectiveness of the remedy as a whole to water resources and is broader than discharges of treated landfill wastewater to surface water alone. DOE acknowledges for the discharge of treated landfill wastewater to surface water, the Tennessee Surface Water Criteria, as identified by the EPA Administrator, will require such discharges to meet a <math>10^{-5}</math> risk level in establishing effluent discharge limitations. Although, this ARAR requires surface water discharges to meet a <math>10^{-5}</math> risk level, it does not affect the CERCLA risk range for other exposure pathways to water resources.</p> |

| W        | 25          | Section 1.4,<br>Page 1-6, 1 <sup>st</sup> full<br>bullet | <p>a. Point the reader to the location of the WAC within the document.</p> <p>b. TDEC and EPA should be involved with DOE in defining and approving operations-based WAC. Consensus and transparency would eliminate conflicts of interest that exist when the party generating the waste has sole responsibility for deciding whether the material meets WAC at a landfill operated by the same party. Regulator involvement in the process, consistent with the FFA for the ORR, would support the oversight needed to ensure WAC compliance. If operational constraints are intended to protect the public and the environment to DOE standards and not CERCLA requirements, the ROD should state such constraints are not being relied on for CERCLA compliance.</p> <p>Radionuclide inventory limits comprise a key element of protective WAC. Therefore, radionuclide inventory limits must be included in the ROD, as promised in the D5 RI/FS (p. ES-7), not established in a future (post-ROD) document.</p> | <p>a. Agree. Text revised to reference Sect. 2.12.2.3.</p> <p>b. Clarification provided. The WAC provided in the ROD support protection of public health and the environment. The operations-based limitations are in place to ensure the landfill Operations group receives and places waste safely with the type of equipment and personnel available. It provides limits on waste size, weight, and packaging requirements based on the available equipment. Any requests for waste disposal that do not meet the physical requirements entails negotiation with the landfill Operations group to ensure the appropriate equipment is on hand for waste receipt. There are no changes to WAC (administrative or analytical). Because equipment changes over time and other capabilities may become available, these limitations are handled by landfill Operations and controlled through their procedures. These procedures are available at FFA Party request to ensure transparency. Text has been added to the D2 ROD to indicate that operational constraints are not relied upon to ensure protectiveness under CERCLA.</p> <p>Per agreement with the Emerging Issues Team, the key limits and information on waste disposal and contaminants have been established in the D2 ROD. If other radionuclide landfill inventory limits are required, those limits will be included in the post-ROD WAC Compliance Plan that will be provided for FFA Party review and approval.</p> |

|----------|-------------|-------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| L        | 31          | Section 1.4, Page 1-7, last bullet in section               | <p>a. The FFA Parties should discuss and agree upon a Zone 1 land-use designation other than “restricted recreational use.” Additional discussion may be warranted regarding any potential effects the designation will have on classified uses of the stream.</p> <p>b. Once the land use designation is changed for Zone 1, how will DOE enforce restricted recreation (i.e., no fishing)? The ROD should clarify how DOE will ensure the integrity of the Zone 1 restricted recreation designation will be maintained.</p>                                                                                                                                    | <p>a. Clarification provided. DOE has selected restricted recreational use since this land is adjacent to the proposed EMDF and will serve as a buffer zone. (Note these land uses are for purposes of defining cleanup levels in the zone of interest.) Although the zone is assigned a restricted recreational category in terms of land use, hypothetical fishing for purposes of demonstrating protectiveness have been assumed. See also the responses to portions of Comment 17.</p> <p>Actual land use is determined by DOE, and new references to the Land Use Plan are added to the D2 ROD.</p> <p>The following text was added: “The land use changes do not affect the surface water use classification.”</p> <p>b. Clarification provided. DOE currently does not allow fishing in any Zone or area of BCV to the east of Hwy 95. DOE does not allow the public to access the area and it is patrolled on a regular basis by DOE Oak Ridge Reservation security. Hunt schedules and maps are provided when that recreational activity (which is a land-based activity only; fishing is not part of the open hunt schedule) is allowed on DOE property. No change to the current enforcement would be expected, with restricted access that is noted in signage at the entrance to Bear Creek Road and patrols (several times daily) as noted. Text was added in Sect. 2.12 to refer to security patrolling that is conducted daily.</p> |
| A        | 32          | Section 1.5, Page 1-7, 1 <sup>st</sup> paragraph in section | <p>The text should clarify DOE seeks waivers for <i>two</i> TSCA requirements in 40 CFR 761.75(b)(3), which is quoted below. One is the hydraulic connection, and the other is the separation between the bottom of liner system and the historical high-water table.</p> <p>(3) Hydrologic conditions. The bottom of the landfill shall be above the historical high groundwater table as provided below. Floodplains, shorelands, and groundwater recharge areas shall be avoided. There shall be <u>no hydraulic connection between the site and standing or flowing surface water</u>. The site shall have monitoring wells and leachate collection. The</p> | Agree. Text was revised as requested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|          |             |                                                            | <p><u>bottom of the landfill liner system or natural in-place soil barrier shall be at least fifty feet from the historical high-water table.</u></p> <p>The text should also state that DOE seeks a waiver for 40 CFR 761.75(b)(5), which deals with the topographic relief of the disposal site to prevent erosion and landslides or slumping. See the Proposed Plan (p. 18, 22, and A-3).</p> <p>The text mentions the waivers would be invoked under 40 CFR 761.75(c)(4). For consistency with the Proposed Plan, the text should also state that DOE is not requesting any statutory waivers under CERCLA 121(d)(4) or Section 300.430(f)(1)(ii)(C) of the National Contingency Plan (NCP).</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| W        | 33          | Section 1.5, Page 1-7, 2 <sup>nd</sup> sentence in section | <p>The cited sentence states, “There is no Principal Threat Waste to be addressed as part of this action.” The ROD needs to clarify this statement. Various DOE documents, including annual Remediation Effectiveness Reports (RERs) for the ORR, indicate the presence of principal threat source material at Y-12 and ORNL. If disposal of principal threat waste is not in the scope of the remedy, the prohibition should be listed among the administrative WAC in Table 2.4.</p>                                                                                                                                                                                                               | <p>Clarification provided. The determination of whether source materials present at a unit would be classified as Principal Threat Waste (PTW) is based principally on EPA guidance (EPA 1991). In this guidance, EPA defines PTWs as those materials that have a high toxicity or mobility and cannot be reliably contained, or present significant risk to human health or the environment. They include liquids and other highly mobile materials (e.g., materials that are released from surface soil due to volatilization, leaching, or surface runoff) or materials having high concentrations of toxic compounds.</p> <p>PTW was identified in the Phase 1 Upper East Fork Poplar Creek Interim ROD as some soils/sediments contaminated with mercury. From that Phase 1 ROD (DOE/OR/01-1951&amp;D3):</p> <ul style="list-style-type: none"> <li>• “The remedy addresses mercury-contaminated soils, sediments, and groundwater, which contribute to contamination of surface water within UEFPC CA.” p.1-1</li> <li>• “The principal threat wastes identified under this remedial decision include (1) the WEMA (soils in the immediate vicinity; storm sewers; and shallow groundwater captured by currently operating sumps), (2) sediment in exposed portions of the UEFPC stream channel, and (3) sediment within Lake</li> </ul> |

|          |             |                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Reality.” p.2-78</p> <p>However, per the mercury negotiations and agreements reached by the FFA parties, no D009 mercury hazardous waste will be disposed of in EMDF and no liquids are accepted for disposal (e.g., elemental liquid mercury). Therefore, there is no PTW destined for disposal in EMDF.</p> <p>Also, see the response to Comment 60 for related text revisions.</p> <p>EPA 1991. <i>A Guide to Principal Threat and Low Level Threat Wastes</i>. OSWER Superfund Publication 9380.3-06FS. November 1991.</p>   |
| W        | 34          | Section 1.6, Page 1-7, 1 <sup>st</sup> bullet in section                                                   | While noting the reference to waste generation project contaminants of concern (COCs), the text states that Section 2.7 includes COCs and their respective concentrations. Section 2.7 provides no list of COCs and no concentrations. The text should be revised to reflect COC projections assumed in developing WAC and establishing discharge limits for landfill wastewater. At a minimum, the ROD should document key chemicals (e.g., mercury, beryllium, and asbestos) and classes of chemicals (e.g., PCBs and dioxins/furans) anticipated to be placed in EMDF.                                                                                                                                                                                                     | Agree. Text has been revised to document key chemicals and their acceptance requirements (Sect. 2.7), as well as projected inventory of radiological contaminants used to demonstrate protectiveness and in developing WAC (Sect. 2.12.2.3).                                                                                                                                                                                                                                                                                        |
| O        | 35          | Section 1.6, Page 1-7, 2nd bullet in section                                                               | Clarify how waste generation project risk assessments are relevant to EMDF, considering those site-specific assessments are conducted for sites other than EMDF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Agree. Text was revised to state:<br>“Because the EMDF will be constructed in an area not influenced by past operations or disposal practices, the existing risk represents background conditions; therefore, a baseline risk assessment is not required.”                                                                                                                                                                                                                                                                          |
| W        | 36          | Section 1.6, Page 1-7, 4th bullet in section<br><br>Also, Section 2.7, Page 2-16, 2nd paragraph in section | The ROD needs to document how WAC keep potential future risks to the public within EPA’s risk management range of 1x10-4 to 1x10-6 cumulative ELCR and HI less than or equal to 1, in accordance with CERCLA’s protectiveness threshold criterion. <sup>3</sup> The cited text states no baseline risk assessment was conducted for EMDF. CERCLA decisions (RODs) are usually supported by human health and ecological risk assessments. Section 2.7 discusses risk assessments performed in the context of site-specific waste generation projects, but the relevance of those evaluations to the EMDF ROD is not clear, as the EMDF will amass the COCs collected from those projects in a new location, where the risks associated with those COCs have not been assessed. | Agree. The text has been revised to indicate the remedy is demonstrated to meet the CERCLA risk range.<br><br>Text/figures have been added to the D2 ROD in Sect. 2.12.2.3 which document EMDF projected radionuclide inventory meets the CERCLA risk range under the release to groundwater scenario and the Inadvertent Human Intrusion scenario. These inventory-based risk projections are similar to baseline risk assessment for typical CERCLA response actions but represent a hypothetical post-closure scenario involving |

|----------|-------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |               | <p><sup>3</sup> Although EPA’s risk management range is 10<sup>-4</sup> to 10<sup>-6</sup> cumulative ELCR and the all-pathways dose assessment is allowed to meet EPA’s 10-mrem/year dose limit, it is TDEC’s position that evaluations of the groundwater-to-surface-water pathway used to develop WAC must meet a cumulative ELCR of 10<sup>-5</sup>. This is based on TDEC’s interpretation of the DRD issued by the EPA Administrator on December 31, 2020 and compliance with Tenn. Comp. R &amp; Regs § 0400-20-11-.16(2)[10CFR 61.41], which will be an EMDF ARAR.</p> | <p>contaminant release to groundwater and surface water.</p> <p>The D2 ROD paragraphs explaining landfill inventory limits have been revised to clarify that the limits for three Tier 1 radionuclides provided in Table 2.7 meet the CERCLA risk range because they are based on the NRC-TDEC 25/75/25 mrem/year critical organ dose ARAR, which EPA asserts is equivalent to 10 mrem/year EDE (OSWER 9200.4-18, Attachment B) and therefore meets CERCLA risk criteria. Additionally, the ROD now documents that the Waste Lot Concentration Limits (WAC) meet the CERCLA risk range.</p> <p>The ROD explains how the accumulated (actual) inventory is tracked relative to LFILs based on the CERCLA risk range. LFILs will be used (in sum-of-fraction-type analyses) to ensure the accumulated inventory remains protective and does not pose a risk outside of the CERCLA risk range.</p> <p>An HI of 1 or less is ensured for EMDF by meeting design and hazardous waste disposal ARARs. The EMDF will meet RCRA subtitle C design requirements. All hazardous waste must meet LDRs to be disposed of in EMDF, and other ARARs are provided to limit PCB waste disposal. Evidence provided in the ROD (Sect. 2.13.2) supports the PCB waiver to siting criteria and provides protectiveness assurance in terms of PCB COCs. Administrative WAC prohibiting disposal of RCRA-listed waste and RCRA (D009) mercury characteristic waste also ensure protectiveness specific to hazardous waste constituents.</p> <p>Historically, very little hazardous waste has been disposed of in EMWMF, and cleanup of Y-12 and ORNL is expected to generate waste that is no different in terms of hazardous COCs, with the exception of mercury hazardous waste, which has been prohibited from disposal in EMDF. EMWMF SOF for hazardous COCs (HI) is well below 1:</p> |

| <b>Part 2: Decision Summary</b> |             |                                                 |                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                             |
| E                               | 37          | Section 2.1, Page 2-3, last sentence in section | Revise the sentence to clarify whether EMDF operations are projected to support the cleanup mission for at least three decades. A draft of DOE's 2021 Appendix J Non-Enforceable Out-Year Planning Targets includes a Remedial Action Report (RAR) for EMDF in 2047, which indicates about two decades of projected operation, based on initiation of operations in the late 2020s. | Clarification provided. The statement says the cleanup mission will take the next 3 decades, e.g., 2021 to 2050. The text does not indicate that is the operational period of EMDF. Beyond the closure of EMDF, monitoring and S&M of the landfill will continue, as will the CERCLA 5-year reviews. No change to the text. |
| E                               | 38          | Figure 2.2, Page 2-5                            | Use different colors, cross-hatching or some other symbology to distinguish Site 7A from Site 7C. Because these sites overlap, the boundaries of each site are not clear.                                                                                                                                                                                                           | Agree. Figure has been revised to better distinguish between the two sites.                                                                                                                                                                                                                                                 |
| E                               | 39          | Section 2.2.1, Page 2-7, 2nd paragraph          | Revise the first sentence to acknowledge DOE continued monitoring groundwater levels beyond the initial year required by the approved sampling plan.                                                                                                                                                                                                                                | Agree. Text was modified to note groundwater monitoring has continued.                                                                                                                                                                                                                                                      |
| E                               | 40          | Section 2.2.1, Page 2-7, 4th bullet             | Delete the portion of the last sentence that discusses the use of groundwater models to predict groundwater levels after the landfill is constructed. As described in Section 2.14.3, the FFA Parties agreed to determine the seasonal high water table elevation through a field study rather than through groundwater                                                             | Agree. Text was deleted and replaced with "...provide input for design calculations." to indicate that some groundwater elevation data (outside of the GWFD area) will still be used.                                                                                                                                       |

|          |             |                                                               | modeling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| E        | 41          | Section 2.2.1,<br>Page 2-7, 1st<br>paragraph after<br>bullets | <p>a. Revise the first sentence as follows:</p> <p style="padding-left: 40px;">Results of the Phase 1 site characterization support final site selection. The results also confirm the CBCV site is suitable for a new, low-level (radioactive) waste (LLW) landfill with the incorporation of an RAO to maintain a 15-ft separation between the bottom of emplaced waste and the seasonal high-water table (see Sect. 2.8).</p> <p>In the context of site suitability, it is imperative to note incorporation of this RAO. Without implementation of the RAO, the CBCV Site would not be suitable, as conceptual designs presented in the RI/FS and subsequent meetings would place waste below current groundwater levels, as stated in Table 2.1.</p> <p>b. The ROD must specify waste disposal in the EMDF would be prohibited if there is a failure to achieve 15 ft of separation between the waste and the seasonal high-water table, as required by the RAO. Per 40 CFR 300.435(b), DOE must ensure all ARARs and terms of ARAR waivers are met and must conform all Remedial Design/Remedial Action (RD/RA) activities to the ROD. TDEC cannot legally approve the landfill design if the remedy does not conform with RAOs and ARARs (including waiver conditions) in the ROD.</p> | <p>a. Agree. Text revised as suggested.</p> <p>b. Clarification provided. The GWFD is planned to address and ensure that a 15-ft zone of separation can be provided; it is DOE's understanding that should a less than 15-ft zone be available per analyses of results from the GWFD, then an adjustment to the base elevation of the landfill (design) would be required to ensure the 15-ft separation can be confirmed and designed appropriately. The comment notes that "DOE must ensure..." DOE agrees they must ensure that all ARARs and waivers are met, but that is also TDEC and EPA's responsibility as well. Their approval of the ROD is the first step in agreeing that ARARs and RAOs <b>can</b> be met by the remedy. TDEC's approval of the design (e.g., through approval of the RDR primary document), which will occur subsequent to the GWFD and analyses of results thereof (that will be applied to the final landfill design), will be their further and final agreement that they (TDEC) has ensured that the RAO is met and ARARs are met.</p> |

|----------|-------------|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E<br>O   | 42          | Section 2.2.1,<br>Page 2-7, last<br>paragraph                       | <p>a. Delete the first sentence or revise it for accuracy. Given the wide range of well completion details and potentiometric surface elevations in BCV, the potential relevance of the statement is unclear.</p> <p>b. The sentence also requires correction because it is not accurate to state groundwater [water table] elevations are similar to predictions in the RI/FS. Although the D5 RI/FS did not present predicted water table elevations in tabular/numerical form, it provided diagrams showing water table elevations as much as 30 ft lower than levels measured during the subsequent investigation (reported in TM-1 and TM-2 reports). Water levels measured in subsequent years were even higher.</p>                                                                                                                                                                                          | <p>a. Agree. Sentence was revised for clarification.</p> <p>b. Agree. The sentence was revised for clarification as follows: "Groundwater elevations were similar to the groundwater elevations predicted in the RI/FS (DOE 2017a), with the exception of higher elevations within the knoll"</p>                                                                                                                                                                                                                                                           |
| N        | 43          | Section 2.2.2,<br>Page 2-9, 4 <sup>th</sup><br>paragraph in section | <p>a. Should the first sentence cite the 2021 RER instead of the 2020 report?</p> <p>b. The last sentence in the cited paragraph states contaminant concentrations in BCV have improved as a result of actions taken to date and notes final remediation goals have not been met. TDEC requests clarification of this text because final remedial goals are not established in the BCV ROD, which is a Phase 1 document.</p> <p>c. Would it be more accurate to state concentrations of <i>some</i> contaminants in Bear Creek have decreased over the long term? The 2021 RER states uranium discharges were more than four times the ROD goal for annual flux, and average uranium-238 (U-238) concentrations also exceeded the risk-based goal. It states EMWFM landfill wastewater discharges increased technetium-99 concentrations in Bear Creek to levels much higher than typical during November 2019.</p> | <p>a. Agree. While the FY2020 RER was available and used for the D1 ROD, the FY2021 RER was used to update the Site History for the D2 ROD.</p> <p>b. Agree. The sentence was revised to state "Although ROD goals have not yet been attained, the preponderance of data presented in the 2021 RER chapter for Bear Creek Valley (Chapter 4) show decreasing concentrations for primary COCs (nitrates and uranium) in surface water and stable trends, no trends, or decreasing trends for groundwater contaminants."</p> <p>c. Agree. See text above.</p> |
| E        | 44          | Section 2.3,<br>Page 2-10, 2 <sup>nd</sup> bullet                   | Cite the final Focused Feasibility Study for Water Management for the Disposal of CERCLA Waste on the Oak Ridge Reservation, Oak Ridge, Tennessee instead of the 2016 (D2) version.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Agree. Text revised as suggested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| W        | 45          | Section 2.4,<br>Page 2-11, 4 <sup>th</sup><br>paragraph             | The cited paragraph states treatment of CERCLA waste to meet the EMDF WAC (e.g., Land Disposal Restrictions [LDRs]) is outside the EMDF scope. Statements throughout the D1 ROD indicate the responsibility for documenting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Agree. The text has been revised to clarify responsibility lies with the waste generator to perform any required treatment to meet LDRs for disposal in EMDF, and point                                                                                                                                                                                                                                                                                                                                                                                     |

|          |             |                                        | <p>hazardous waste treatment will be the waste generator’s responsibility. That responsibility should be documented in this paragraph, along with a general description of which CERCLA reports will document such treatment. The paragraph should also be revised to acknowledge generation of mixed CERCLA waste will be reported in conjunction with the Site Treatment Plan.</p>                                                                                                                                                                                                                                                                                                                          | <p>to the Waste Handling Plan(s) where such treatment would be documented.</p> <p>Clarification provided. Please note that D009 mercury hazardous waste is prohibited from disposal in EMDF. The ROD, as a remedy addressing EMDF, will not reference the Site Treatment Plan with regard to mercury (mixed) waste generation since it will not be disposed of in EMDF. Furthermore, because at this time no RCRA hazardous waste is foreseen/forecast that would require treatment prior to disposal in EMDF, the Site Treatment Plan will not be discussed in the ROD.</p> |
| T        | 46          | Section 2.4, Page 2-11, last paragraph | <p>The last sentence on the cited page states DOE has completed the required public review and comment on all information associated with the evaluation presented in the Proposed Plan. TDEC anticipates this will be a factual statement upon signing the final ROD. However, as of the D1 ROD (summer 2021), DOE has not completed the required public review and comment on WAC, as the Proposed Plan did not present that information. It is also TDEC’s perspective that additional public review and comment is warranted on updated groundwater information, approaches for establishing landfill wastewater discharge limits, and significant changes the D1 ROD incorporates in the ARAR table.</p> | <p>Clarification provided. With submittal of the D1 ROD, the FFA parties have recommended additional public engagement. That effort allows for additional public comment.</p>                                                                                                                                                                                                                                                                                                                                                                                                |

|----------|-------------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| O        | 47          | Section 2.5.2, Page 2-13, 1st paragraph          | <p>a. Delete the sixth full sentence, beginning with “Piezometric surface,” or revise it for accuracy. Given the wide range of well completion details and potentiometric surface elevations in BCV, the potential relevance of the statement is unclear.</p> <p>b. The sentence also requires correction because it is not accurate to state groundwater [water table] elevations are similar to predictions in the RI/FS. Although the D5 RI/FS did not present predicted water table elevations in tabular/numerical form, it provided diagrams showing water table elevations as much as 30 ft lower than levels measured during the subsequent investigation (reported in TM-1 and TM-2 reports). Water levels measured in subsequent years were even higher.</p> <p>c. The seventh sentence states, “The piezometric surface responds to rainfall events, indicating recharge is occurring on the site.” TDEC’s analysis of the piezometer data suggests direct recharge from infiltrating precipitation accounts for a small proportion of the measured water level fluctuations, relative to seasonal effects from the dry season (summer/fall) to the wet season (winter/spring).</p> | <p>a. Agree. Sentence has been revised to clarify.</p> <p>b. Agree. Sentence has been revised to clarify. In addition, the following text was added: “A groundwater field demonstration will be conducted to resolve TDEC concerns on the piezometric surface within the knoll area (Sect. 2.14.4).</p> <p>c. Agree. The following text was added: “Seasonal variation is also observed, with higher piezometric surfaces observed during the winter/spring wet season (typically November to March) than in the summer/fall dry season.”</p>                                                                         |

The cited reference is correct for the text in this paragraph, which was taken almost verbatim from the Proposed Plan (DOE 2018a). However, the additional reference to Robinson and Johnson (1995) ( <i>Results of a Seepage Investigation at Bear Creek Valley, Oak Ridge, Tennessee January – September 1994</i> , U.S.G.S. Open-File Report 95-459) has been added to the ROD.                                                                                                                                                                                                            |
| N        | 49          | Section 2.5.4, Page 2-14                         | <p>Per Tenn. Comp. R. &amp; Regs. § 0400-40-07-.04(7)(a) (an applicable regulation per Table A.2), mitigation is required when an activity results in an appreciable permanent loss of resource value such as the fill of wetlands. In what primary document will DOE propose its mitigation plans for these wetland impacts?</p> <p>The following general comments were developed during TDEC’s review of the EMDF Natural Resource Assessment report. These comments are among several submitted to DOE on November 29, 2018. They are repeated here because TDEC identified several deficiencies in the assessment that serves as the basis for statements in Section 2.5.4 of the D1 ROD. The report was not a primary FFA document, and DOE elected not to respond to TDEC comments.</p>                                                                                                                                                                                                                                                                                                                                                                                                  | Clarification provided. The EMDF Natural Resources Assessment Report was used to inform development of the ROD, but is not a primary document. Ecological resources will be protected and/or mitigated as required by the ARARs included in the ROD. As per the FFA process, these efforts will be discussed with appropriate state natural resource regulators, who will request additional information if needed and the mitigations decided on will be described in post-ROD documents. The information will depend on the area/extent of the remedy. Section 2.12.4 of the ROD has been updated to indicate this. |

|----------|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|          |             |               | <p>The assessment described in [the Natural Resources] report is inadequate to comprehensively inventory flora and fauna species in the proposed EMDF area. Examples of key deficiencies include the following:</p> <ul style="list-style-type: none"> <li>• Collectively, DOE, TDEC, and Domain 07 National Ecological Observatory Network (NEON) assessments documented 11 state and federally listed flora and fauna species in the CBCV area since 2015. However, the DOE assessment does not document four of these species.</li> <li>• The report provides insufficient information for several surveys associated with DOE’s assessment. For example, the report provides minimal justification to explain the rationale for sampling site choices, and DOE did not sample some parts of the survey area.</li> <li>• The report does not present species accumulation curves or rarefaction analyses to demonstrate whether the assessment sufficiently represented species living in ecological community at the CBCV site.</li> <li>• The assessment did not include a benthic macroinvertebrate survey or address the structure or condition of this community. TDEC recommends DOE survey the benthic macroinvertebrate community at the CBCV site, including spring and fall samples, before construction activities affect these communities.</li> <li>• Upper headwater streams often provide habitat for taxa not typically found further downstream in the watershed. The diversity of fish species is likely limited in headwater streams, so macroinvertebrates are often critical members of healthy stream ecosystems. DOE should identify macroinvertebrates at the lowest taxonomic levels possible. A cursory examination will not provide the necessary information to determine impacts to the aquatic communities during and after landfill construction.</li> <li>• DOE conducted plant surveys only along streams and tributaries and not within the proposed EMDF footprint. Rare plant species likely exist throughout the survey area, not just along streams and tributaries.</li> <li>• The assessment did not document at least two common vertebrate species and more than five threatened and endangered (T&amp;E) vertebrate species (among all vertebrate taxa) known or likely to exist in the CBCV area.</li> <li>• The assessment may have not have adequately sampled cavity-roosting bat species which are often underrepresented by acoustic surveys. Four state</li> </ul> |          |

|          |             |               | <p>and federally listed T&amp;E bat species in the area are cavity-roosting species. DOE should conduct mist-netting and/or direct roost searches to represent T&amp;E bat species at the CBCV site more completely.</p> <ul style="list-style-type: none"> <li>• The assessment did not document five species of shrews, four T&amp;E species and one common species, known or likely to live in the CBCV site area. Sherman live traps are not well suited for evaluating fossorial and semi-fossorial species (e.g., moles and shrews). DOE's assessment should use additional methods to produce a more complete inventory of the small mammal community.</li> <li>• The report states Sherman live traps were set in "strategic locations at each point," but it does not describe how DOE selected the strategic locations. While this approach is common practice, it may inadvertently bias the species captured. For example, setting Sherman traps along fallen logs is a great way to target certain species of rodents that utilize fallen debris as thoroughfares to travel above leaf litter, but setting traps in this manner is likely to miss species that prefer to navigate under the cover of the leaf litter itself.</li> <li>• The report should provide more detailed information about the duration of the small mammal survey. It appears the survey was not sufficient to characterize the small mammal community. If so, DOE should complete a more thorough inventory of the small mammal community to document other species that may be present, particularly rare species.</li> <li>• The report indicates 48 Sherman traps (three traps per site at 16 sites across the survey area) were set for a single night. Typical return on small mammal trapping effort is approximately 10% trap success. For 48 traps, DOE was likely to capture only four to five animals per night of trapping. This is not sufficient to describe the small mammal community of any area, especially the CBCV community, which is dominated by a single species (&gt;90% deer mouse, <i>sensu lato</i>).</li> <li>• The report should include more detailed information about cover board sampling for reptiles and amphibians.                         <ul style="list-style-type: none"> <li>○ The report provides no information about cover board placement or location selection. If field crews placed cover boards at strategic locations, as described for the Sherman live traps, the survey may have biased the reptile and amphibian inventory to species that favor</li> </ul> </li> </ul> |          |

| S        | 50          | Section 2.7, Page 2-16, 3 <sup>rd</sup> paragraph in section | <p>The cited paragraph suggests the choice is to build EMDF at the CBCV Site or accept risks of no action. This text should be clarified to be consistent with the draft RI/FS reports. The RI/FS drafts evaluated other alternatives and determined them to be protective. As stated in Section 2.9 and summarized in Table 2.1, protective alternatives included a Dual Site Alternative (construction of two smaller onsite landfills), a Hybrid Disposal Alternative (significant disposal at onsite and offsite landfills), and an Offsite Disposal Alternative (offsite disposal of all CERCLA waste exceeding the capacity of EMWMF).</p> | <p>Clarification provided. The cited paragraph describes risks from the No Action Alternative as compared to waste disposal at EMDF.</p> <p>The following text has been added as a new paragraph in Sect. 2.7:</p> <p>“Consolidation of the waste at the EMDF from multiple cleanup projects across the ORR will result in a significant reduction in mobility of hazardous substances, pollutants, and contaminants by placement in a landfill with multi-layer liner and final cover systems. This consolidation will also result in minor risks to human health and the environment during the operational period through release of treated wastewater to surface water; however, the risk is controlled to within acceptable limits since the wastewater will be treated to remove the majority of contaminants per CWA ARARs. Releases to air are minor; no measurable risk has been recorded to date at the existing facility (EMWMF), as documented in the annual Phased Construction Completion Reports (PCCRs) for that facility (all reports may be found at the DOE Information Center: <a href="https://doeic.science.energy.gov/">https://doeic.science.energy.gov/</a>). Long-term risk from releases to groundwater and surface water as the facility ages are controlled to within the CERCLA risk range via defense in depth: facility design and features, WAC, monitoring, and institutional controls (see Sect. 2.12.2). Carcinogenic risk posed by estimated contaminants to be left in place at closure are shown to be protective to the CERCLA risk range for the exposures describe above, thus meeting the RAOs.”</p> |

|----------|-------------|-------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| O        | 51          | Section 2.8, Page 2-17, 1 <sup>st</sup> & 2 <sup>nd</sup> bullets | <p>The ROD does not explain how the remedy will prevent “exposure that exceeds a human health risk of <math>1 \times 10^{-4}</math> to <math>1 \times 10^{-6}</math> cumulative ELCR or HI of 1” required by two of the RAOs. <small>Error! Bookmark not defined.</small></p> <p><sup>3</sup> Although EPA’s risk management range is <math>10^{-4}</math> to <math>10^{-6}</math> cumulative ELCR and the all-pathways dose assessment is allowed to meet EPA’s 10-mrem/year dose limit, it is TDEC’s position that evaluations of the groundwater-to-surface-water pathway used to develop WAC must meet a cumulative ELCR of <math>10^{-5}</math>. This is based on TDEC’s interpretation of the DRD issued by the EPA Administrator on December 31, 2020 and compliance with Tenn. Comp. R &amp; Regs § 0400-20-11-.16(2) [10 CFR 61.41], which will be an EMDF ARAR.</p> | <p>Clarification provided. The D2 ROD text has been revised (Sect. 2.7) to clarify the basis for remedy protectiveness and meeting RAOs. The ROD demonstrates that the EMDF disposal system (including siting and facility design, waste inventory, WAC, monitoring, and institutional controls) meets the threshold criterion for protection of human health and the environment. The projected inventory for the EMDF disposal system has been demonstrated to be protective within the CERCLA risk range and this information is provided in the D2 ROD.</p> <p>See the response to Comment 36, which also addresses the basis for CERCLA protectiveness of the EMDF disposal system, including analytic WAC and ARARs.</p> |
| O        | 52          | Section 2.9.2, Page 2-18, 3 <sup>rd</sup> paragraph below bullets | <p>As noted in General Comment 2(f), revise the text to include a clear statement that the temporary drainage features will only be used to control surface water, perched groundwater, and infiltration. The ROD should also state that EMDF will not rely on drainage features under the waste, including underdrains to permanently suppress the water table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Clarification provided. Text was added to indicate that temporary drainage features will only be used to control surface water, perched groundwater, and infiltration, as follows. Text was further modified to incorporate text provided by TDEC during comment resolution.</p> <p>Additional language provided by TDEC to state that TDEC does not allow underdrains for permanent groundwater suppression was added to Sect.12.2.1.</p> <p>Table 2.2 [previously Table 2.1] was also revised to state that the CBCV site does not rely on underdrains beneath the waste.</p>                                                                                                                                             |
| O        | 53          | Table 2.1, Pages 2-22 & 2-23                                      | <p>a. Overall protection of human health and the environment: The entry for the CBCV site states “Would meet all RAOs.” However, the ROD does not explain how the remedy would meet the first two RAOs listed on p. 2-17—namely, preventing “exposure that exceeds a human health risk of <math>1 \times 10^{-4}</math> to <math>1 \times 10^{-6}</math> ELCR or HI of 1.” <small>Error! Bookmark not defined.</small></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>a. Clarification provided. As stated at the top of Table 2.2 [previously Table 2.1], all onsite disposal options meet RAOs and are “Protective because waste would be disposed in a landfill designed for long-term containment to be protective of human health and the environment through application of land use controls, application of WAC, and application of ARARs.”</p> <p>Additional information is provided in response to Comment 36.</p>                                                                                                                                                                                                                                                                      |

|----------|-------------|------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |                                                      | <p>b. In the row titled <i>Long-term effectiveness and permanence</i> at the top of p. 2-22, the last CBCV Site bullet states, “Temporary drainage features are not expected to be used long term. Temporary drainage features.” Revise the bullet to state, “Drainage features are temporary.”</p> <p>c. For CBCV site (Implementability), Table 2.1 states “Reliance on drainage systems expected to be required only during construction.” Revise this text for consistency with the language in Section 2.9.2—i.e., that temporary drainage features will only be used to control surface water, perched groundwater, and infiltration and that EMDF will not rely on drainage features under the waste to permanently suppress the water table.</p> <p>d. Public acceptance: Update for consistency with Section 2.10.9.</p> <p><sup>3</sup> Although EPA’s risk management range is 10<sup>-4</sup> to 10<sup>-6</sup> cumulative ELCR and the all-pathways dose assessment is allowed to meet EPA’s 10-mrem/year dose limit, it is TDEC’s position that evaluations of the groundwater-to-surface-water pathway used to develop WAC must meet a cumulative ELCR of 10<sup>-5</sup>. This is based on TDEC’s interpretation of the DRD issued by the EPA Administrator on December 31, 2020 and compliance with Tenn. Comp. R &amp; Regs § 0400-20-11-.16(2)[10 CFR 61.41], which will be an EMDF ARAR.</p> | <p>b. Agree. Text was revised to clarify and to address other comments related to drainage feature, such as underdrains, being temporary.</p> <p>c. Agree. The first and second bullets were revised as follows:</p> <ul style="list-style-type: none"> <li>Reliance on <b>temporary</b> drainage systems expected to be required only during construction <b>to control surface water, perched groundwater, and infiltration.</b></li> <li>No reliance on underdrains beneath waste footprint required <b>to suppress the water table.</b></li> </ul> <p>d. Agree. Text was revised as suggested to state: “The majority of commenters during the Public Comment Period were in favor of the preferred remedy as presented in the Proposed Plan.”</p> |
| C        | 54          | Page 2-28, Table 2.2                                 | For consistency with CERCLA guidance, the table should present capital (construction) costs and operation and maintenance (O&M) costs separately.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Clarification provided. Table 2.3 [previously Table 2.2] is all sites and options, so does not include the O&M costs, but those O&M costs for the selected remedy are provided in Table 2.11. Note that O&M is essentially the same for all onsite options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| A        | 55          | Section 2.10.2, Page 2-25, last paragraph in section | As noted in Comment 32, the text should clarify that DOE: <ul style="list-style-type: none"> <li>Seeks waivers for <i>two</i> TSCA requirements in 40 CFR 761.75(b)(3)</li> <li>Seeks a waiver for 40 CFR 761.75(b)(5)</li> <li>Is not requesting statutory waivers under CERCLA 121(d)(4) or NCP 300.430(f)(1)(ii)(C).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Agree. Text was revised as requested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| E        | 56          | Section 2.10.8, Page 2-29, last paragraph in section | The cited paragraph states DOE and the state worked together to resolve concerns listed in the preceding bullets. The long-term risk evaluation will hinge on agreements regarding the evaluated scenarios, the locations of points of compliance, and key assumptions, such as flow paths and distribution coefficients. The text should identify specific ROD sections that resolve the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Agree. Text revised to reference the applicable sections for the state’s key concerns. Text was further modified to incorporate text provided by TDEC during comment resolution. Also see response to Comment 57.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| E        | 57          | Section 2.10.8, Page 2-29                                       | For clarity and completeness, revise text in the six bullets to more accurately reflect the sequence and wording of the seven key concerns documented in the State Acceptance section of the 2018 Proposed Plan. The first three bullets are acceptable. The fourth bullet combines the third and fourth key concerns; the fifth bullet addresses the seventh key concern; and the sixth bullet addresses the fourth key concern again and combines it with the fifth key concern. The sixth key concern is not mentioned. Consider revising to avoid confusion.                                                                                                                                                                                                | <p>Agree. The fifth bullet was moved to the seventh position. The fourth and sixth bullets were revised and a new bullet was added to address the sixth concern as follows:</p> <p>Revised fourth bullet (State Concern 4)</p> <ul style="list-style-type: none"> <li>• “Inclusion of DOE Order-required performance assessment, composite analysis, and preliminary Disposal Authorization Statement in the Administrative Record (Sect. 2.12.2.3)”</li> </ul> <p>Fifth bullet – Replaces previous sixth bullet (State Concern 5)</p> <ul style="list-style-type: none"> <li>• “Agreement to limit or manage mercury disposal to provide reasonable assurance the amount of mercury released in the future will meet the intent of the Tennessee Water Quality Control Act and will not adversely impact people fishing and eating fish downstream (Sect. 2.12.2.3).”</li> </ul> <p>New sixth bullet (State Concern 6)</p> <ul style="list-style-type: none"> <li>• “Agreement that permanent underdrains are not allowed to permanently suppress the water table to mitigate springs or streams at proposed landfill sites (Sect. 2.12.1).”</li> </ul> |
| P        | 58          | Section 2.10.9, Page 2-29, 2 <sup>nd</sup> paragraph in section | <p>a. The text states DOE received comments from 194 individual commenters. The compilation of comments DOE sent to TDEC on January 16, 2019 included comments from 195 entities (individuals or organizations), accounting for multiple comments from five entities. TDEC and DOE should compare notes to ensure all comments are considered.</p> <p>b. Consider revising the first sentence in this paragraph as follows to clarify that Part 3 <i>summarizes</i> public comments. It is important for the public to understand the ROD does not present all comments in their entirety.</p> <p style="text-align: center;">The Responsiveness Summary in Part 3 of this ROD summarizes comments received during the public review and comment period and</p> | <p>a. Clarification provided. In one instance, a commenter also commented on behalf of an organization, which had also provided comments. These were counted as a single commenter, hence DOE 194, and TDEC 195.</p> <p>b. Disagree. The responsiveness summary includes all comments in their entirety.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Category | Comment No. | Sect/<br>Page                                                           | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| W        | 60          | Section 2.11, Page 2-32                                                 | The cited section states, "...the concept of principal threat waste does not apply to this decision." The ROD needs to clarify this statement. Various DOE documents, including annual RERs for the ORR, indicate the presence of principal threat source material at Y-12 and ORNL. If disposal of principal threat waste is not in the scope of the remedy, the prohibition should be listed among the administrative WAC in Table 2.4.                                                                                                                                                                                                                                                                                                                       | See response to Comment 33.<br><br>Clarification provided. Text in Sect. 2.11 was revised to include the Administrative WAC and the FFA parties agreed-upon mercury management approach in the explanation of why principal threat waste is not addressed by the selected remedy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| L        | 61          | Section 2.12, Page 2-33, 2 <sup>nd</sup> and 3 <sup>rd</sup> paragraphs | As noted in Comment 17(b), the FFA Parties should discuss and agree upon a Zone 1 land-use designation. The stream designation will continue to be determined by the Tennessee Board of Water Quality, Oil & Gas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | See responses to Comment 31a.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| O        | 62          | Section 2.12.1, Page 2-35, 2 <sup>nd</sup> Paragraph                    | <p>a. The cited paragraph states CERCLA's preference for treatment as a principal element of the remedy is not germane to a disposal decision. The waste disposal remedy selected in the ROD must address CERCLA's preference for cleanup through active treatment of all landfill wastewater, not just individual waste lot decisions in other CERCLA documents.</p> <p>b. The cited paragraph also states the CERCLA preference will be addressed through treatment required on waste generated under other CERCLA decisions. Since DOE is managing substantial parts of the Y-12 cleanup as a removal action, as contrasted with a remedial action, clarify which CERCLA reports will document the required treatment for the waste generating projects.</p> | <p>a. Agree. The text was revised as follows: "Element 5 is addressed through treatment required for individual waste lots generated under other CERCLA decision documents (e.g., waste handling plans), as needed, to meet the EMDF WAC before onsite disposal. CERCLA's preference for treatment is also addressed by treatment of landfill wastewater to meet ARARs and discharge limits prior to release."</p> <p>b. The FFA generally requires an approved Waste Handling Plan prior to acceptance of the waste for disposal at an onsite CERCLA landfill. The Waste Handling Plan documents potential treatment (if appropriate) for waste disposed at onsite CERCLA landfills. If treatment is required for waste disposed onsite in CERCLA cells, then this is documented in the project-specific PCCR.</p> |
| E        | 63          | Section 2.12.1, Page 2-35, Last Bullet                                  | <p>The text states:</p> <p>The need for underdrains is limited to consideration under berms. Any/all groundwater intercepts in use during disposal operations are conceptualized</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Clarification provided. Text revised to read as follows, based on additional TDEC comment on the D2 ROD working draft:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|----------|-------------|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |                                                        | <p>as not necessary or operational following closure and will not be under the waste.</p> <p>For clarity, revise the language as follows:</p> <p>Permanent underdrains are not required to control the groundwater table, although temporary drainage features may be necessary to divert surface water, perched groundwater, and infiltration from excavations and improve ground conditions to aid construction.</p>                                                                                                                                                                                                                           | <p>Permanent underdrains are not required to control the groundwater table. Underdrains will not be used as corrective actions for groundwater intrusion into the geologic buffer. Temporary drainage features may be necessary to divert surface water, perched groundwater, and infiltration from excavations and improve ground conditions to aid construction. The absence of underdrains is critical to the state's acceptance of this remedy. Should different conditions arise in the future, any consideration of a proposal for an underdrain as defined by agreement of the FFA parties would be considered to fundamentally alter the remedy in performance and scope, requiring a ROD amendment per 40 <i>CFR</i> 300.435(c)(2)(ii).</p>                                                                                                                                                                                                             |
| W        | 64          | Section 2.12.2, Page 2-37, 2 <sup>nd</sup> bullet      | <p>TDEC and EPA should be involved with DOE in defining and approving operations-based WAC. While TDEC and EPA are involved in waste characterization decisions, consensus and transparency regarding operational constraints would eliminate potential conflicts of interest that exist when the party generating the waste has sole responsibility for deciding whether the material meets operational constraints at a landfill operated by the same party. Regulator involvement in that part of the process, consistent with the FFA for the ORR, would support the oversight needed to ensure waste is managed in a protective manner.</p> | <p>Clarification provided. The purpose of the operations-based requirements is not to provide protectiveness to the public, but to protect the features of the landfill (e.g., liner, equipment). As such, the landfill Operations personnel oversee those operational constraints and grant variances. The constraints are summarized in operational plans. The WAC Compliance Plan will reference those plans, and the constraints are conveyed to the generator.</p> <p>There is no conflict of interest between generators and landfill operations; it is in the best interest of both parties to conduct business successfully and safely. Generators and landfill operators work as separate groups and are separately held accountable and audited by DOE. See response to Comment 71 also.</p> <p>A sentence was added to the D2 ROD (Sect. 2.12.2.3) to indicate the operations-based requirements are not relied on to meet CERCLA protectiveness.</p> |
| A        | 65          | Section 2.12.2.1, Page 2-38, 1 <sup>st</sup> paragraph | <p>The second sentence states the landfill berm may be placed over a stream identified as D-10W. This would require compliance with substantive requirements in Tenn. Comp. R. &amp; Regs. § 0400-40-07, which are listed as ARARs in the D1 ROD. The requirements must remain as ARARs in the final ROD.</p>                                                                                                                                                                                                                                                                                                                                    | <p>Agree.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

This section describes the conceptual design and infrastructure only. Section 2.12.2.5 [previously Sect. 2.12.2.4] describes operations; the following sentence was added to the discussion of landfill wastewater: “Landfill wastewater from EMDF will be treated prior to discharge to ensure it is protective of recreational use (human health), specifically fish ingestion.”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| N        | 68          | Section 2.12.2.2,<br>Page 2-39, Last<br>paragraph under<br>Phase I Construction | <p>The ROD should clarify plans for phased construction of the landfill and the projected sequencing of waste-generating cleanup and demolition projects.</p> <p>a. How does the phased construction approach align with the preliminary design information in the March 4, 2021 EMDF Leachate/Contact Water Treatment Overview, which includes a 2.75-million-gallon collection pond in Cell 4? TDEC requests a copy of any subsequent landfill wastewater treatment plans DOE has developed.</p> <p>b. Which waste was being referred to on May 12, 2021 when an OREM representative told the Oak Ridge Site Specific Advisory Board (ORSSAB), “some of our waste is heavy and needs to be on the floor of the disposal cell”?<sup>14</sup></p> <p><sup>14</sup> Barber, W., 2021, Proposed Landfill Called Central to Y-12, Oak Ridge National Lab Cleanup, <i>Weapons Complex Monitor</i>, v. 32, no. 19, May 14.</p> | <p>Clarification provided. As described, the phases will depend on the remediation progress. Because remediation progress is tied to many factors (e.g., funding, priorities, safety concerns), a sequence was not developed.</p> <p>a. Clarification provided. The EMDF design has not been fully developed and is still at the preliminary stage used for initial planning purposes. The design will be further developed and provided to the FFA parties in the post-ROD Remedial Design Report for review/approval. This document will contain the more developed designs for the infrastructure supporting the landfill wastewater treatment facility, including collection pond(s) necessary. No treatment plans have been developed at this point in the project.</p> <p>b. Clarification provided. Although this comment is in reference to EMWMF, an answer is provided because it is expected to also apply to the proposed EMDF. The statement refers to the preferred disposal of heavy waste packages on or near the floor of the disposal cells for ease of placement and to reduce the potential for differential compaction. An example of these heavy items includes several heavy steel beams from the centrifuge project that were placed on the EMWMF Cell 6 floor.</p> |

| W        | 70          | Section 2.12.2.3,<br>Page 2-40, 2 <sup>nd</sup> bullet      | <p>TDEC recognizes DOE completed the PA, from which many of the WAC limits are derived, under its internal Directives. However, WAC must be shown to be protective in accordance with CERCLA to support the ROD. CERCLA requires a remedial alternative to be protective of human health by meeting EPA’s risk management range of <math>1 \times 10^{-4}</math> to <math>1 \times 10^{-6}</math> cumulative ELCR and HI less than or equal to 1.<sup>3</sup></p> <p>Although not directly related to WAC, which provide long-term protectiveness after landfill closure, the EPA Administrator’s December 31, 2021 the EPA Administrator’s DRD directs DOE to develop limits for radionuclides in EMDF landfill wastewater to be discharged during the decades of landfill operation to meet <math>1 \times 10^{-5}</math> ELCR based on Tenn. Comp. R. &amp; Regs. § 0400-40-03-.03.</p> <p>As explained in a PA review enclosed with TDEC’s October 15, 2020 letter to DOE, the PA base case alone does not provide a basis for analytic WAC development that satisfies the CERCLA threshold criterion for protectiveness. Moreover, the PA does not evaluate the toxic effects of uranium or of non-radiological contaminants projected for disposal.</p> <p>In an effort to facilitate resolution of this concern, TDEC offered several suggestions to help DOE develop protective WAC acceptable to TDEC. These approaches focus on WAC development for radionuclides and chemical contaminants. Additional technical analysis (e.g., bioconcentration) are needed for certain chemical contaminants projected to be in the waste, including mercury and PCBs.</p> <p>(1) Quantitatively evaluate the likelihood of bathtubbing after the institutional control period, based on modeling of liner infiltration with hydraulic head resulting from bathtubbing. Develop inventory-limit WAC from radionuclide concentrations in surface water and groundwater due to modeled estimates of liner overflow rate. This approach should address both compliance with ARARs, such as groundwater and surface water protection standards (e.g., uranium maximum contaminant level [MCL] and ambient water quality criteria [AWQC] values), as well as protectiveness under CERCLA ELCR and chemical hazard criteria, including site-specific assessment of fish-ingestion and agricultural</p> | <p>Clarification provided. The ROD text has been revised to clarify that the inventory limits in Table 2.7 are based on the NRC-TDEC 25/75/25 mrem/year critical organ dose ARAR, and therefore meet the CERCLA risk range.</p> <p>Waste Lot Concentration Limits represent an annual IHI dose limit of 100 mrem, which corresponds to <math>ELCR &lt; 1.0E-04</math> for an exposure duration of 1 year. The basis for CERCLA protectiveness of the WLCL is explained in the D2 ROD text of Sect. 2.12.2.3.</p> <p>Clarification provided. The results of the PA modeling and the information provided in the D2 ROD demonstrate that uranium does not pose a risk within the 1000-year compliance period. Additional modeling past 1000 years to 10,000 years also demonstrates uranium is not a risk during that timeframe. Therefore, if it presents no ELCR during that timeframe, neither does it present a toxicity threat.</p> <p>Agree. DOE has agreed with TDEC to conduct a supplemental analysis based on alternate assumptions regarding future landfill performance and exposure pathways. This supplemental analysis and results will inform development of the WAC Compliance Plan and landfill design. This analysis corresponds to items (1), (3) and (4). LFIL for uranium may result from that analysis to provide an extended measure of safety to ensure the toxicity of the metal does not present an unacceptable</p> |

|          |             |               | <p>exposure pathways.</p> <p>(2) Apply WAC derived from the PA intruder analysis (Appendix I) as limits on concentrations in each waste lot.</p> <p>(3) Modify PA inputs/assumptions in accordance with critical issues identified the PA review enclosed with TDEC's October 15, 2020 letter to DOE to calculate total-inventory WAC that provide 95% confidence that ARAR concentrations (MCL, AWQC, etc.) are not exceeded, that the <math>1 \times 10^{-5}</math> ELCR threshold is met, and that the HI of 1 is met.</p> <p>(4) Modify the all-pathways model PA inputs/assumptions for evaluating impacts to Bear Creek surface water to calculate WAC that 1) do not cause exceedance of MCLs or AWQCs, 2) assure compliance with other ARARs, and 3) demonstrate protectiveness for the CERCLA thresholds (<math>1 \times 10^{-5}</math> ELCR and HI less than or equal to 1) for all exposure pathways, including site-specific assessment of the fish-ingestion exposure pathway.</p> <p>(5) Apply a more thorough analyte list for initial characterization efforts of individual waste lots, modified as appropriate based on process knowledge, to avoid the risk of missing important radionuclides by analyzing a shorter list. Then, scale the analytical list back to those radionuclides determined to be relevant for each waste lot.</p> <p>(6) Calculate rolling WAC that change as the landfill is filled, as has been suggested for the Nevada National Security Site (NNSS) Area 5 Radioactive Waste Management Site (RWMS). This approach may be useful when there is uncertainty about the radionuclide content of future waste lots. Rolling WAC involves adjusting WAC as waste is disposed to optimize the remaining "radiological capacity" as the facility fills. It requires characterization of all waste disposed, but it provides for efficient use of the resource (landfill) and allows protectiveness to be demonstrated.</p> <p><sup>3</sup> Although EPA's risk management range is <math>10^{-4}</math> to <math>10^{-6}</math> cumulative ELCR and the all-pathways dose assessment is allowed to meet EPA's 10-mrem/year dose limit, it is TDEC's position that evaluations of the groundwater-to-surface-water pathway used to develop WAC must meet a cumulative ELCR of <math>10^{-5}</math>. This is based on TDEC's interpretation of the DRD issued by the EPA Administrator on December 31, 2020 and compliance with Tenn. Comp. R &amp; Regs § 0400-20-11-.16(2)[10CFR 61.41], which will</p> | <p>hazard, and toxicity-based uranium inventory limits may be included in the WAC Compliance Plan, an FFA primary document.</p> <p>Item (2) is documented in the D2 ROD. Waste Lot Concentration Limits (WAC derived from the PA intruder analysis) are applied only to waste lots, not to the landfill as a whole.</p> <p>A more extensive list of radionuclides is documented in the D2 ROD, which addresses Item (5). In addition, the response to Comment 81 addresses how a list of possible radiological contaminants is evaluated when a waste lot is being considered for disposal in EMDF.</p> <p>Item (6) is essentially how the inventory will be tracked during operations relative to LFIL, through closure of EMDF. See response to Comment 2c.</p> <p>Disagree. With respect to hazardous waste constituents other than uranium, DOE relies on the RCRA and TSCA regulations (included in the ROD as ARARs and also listed as administrative WAC) to provide the protectiveness needed in terms of acceptance and containment of chemical contaminants, as these requirements were promulgated by EPA and are enforced by the State of TN to protect the public and environment when such contaminants are disposed of in a land-based disposal facility. The requirements are the basis for providing protectiveness for these same contaminants disposed of in other land-based</p> |

Further, as explained in the responses to Comments 36 and 45, very little, if any, waste disposal in EMDF will contain non-radiological contaminants at quantities that would render them hazardous under RCRA (and if determined to be hazardous under RCRA, a waste must be treated to meet LDRs). For mercury, based on the requirement to pass TCLP testing without treatment in order to be eligible for disposal in EMDF, quantities of mercury in waste lots that can be disposed of in EMDF will not exceed quantities that could be disposed of in sanitary facilities throughout the country.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| W        | 71          | Section 2.12.2.3, Page 2-40, 1 <sup>st</sup> paragraph after bullets | <p>This paragraph states each waste stream will be certified by the generator as complying with all WAC before being allowed to send waste to EMDF. DOE Manual (M) 435.1-1 requires implementation of a waste certification program to ensure WAC are met. The program shall designate officials who have the authority to certify and release waste for shipment.</p> <p>TDEC understands a post-ROD WAC compliance plan will present additional details, but several questions are relevant to the decision in light of lessons learned from EMWMF operations and weakness identified in DOE’s July 2020 report, Enterprise-wide Assessment of the Department of Energy’s Packing and Shipping of Radioactive Waste.<sup>15</sup></p> <p>a. Is waste certification authority held by DOE officials or contractor personnel?</p> <p>b. If waste certification authority resides with personnel employed or subcontracted by the contractor that builds and operates the landfill and staffs the WAC Acceptance Team, what safeguards will be established to minimize potential conflicts of interest, where the same entity controls waste generation; landfill construction, operation and monitoring; waste</p> | <p>Clarification provided. The generator does certify that all WAC are complied with in order to send waste to EMDF. The generator (trained Waste Packaging Specialists) develops/implements waste characterization sampling and analysis plans, waste handling plans, and waste profiles, and generates and transports waste. They visually verify and sign a certification statement attesting the shipment meets the WAC.</p> <p>On the waste acceptance side, under the DOE O 435 Certification Program, the WAC Attainment Team is responsible for ensuring WAC are met as well and participate in the development of the stated plans and waste profiles.</p> <p>a. Contractor personnel hold the waste certification authority on behalf of DOE. DOE also has independent contractors and federal personnel that provide direct oversight, following and reviewing all aspects of the process, from the waste generator to the waste acceptance team. DOE also performs reviews of the contractor-held processes and reporting.</p> <p>b. DOE maintains a direct line of communication with the WAC Acceptance Team and personnel. DOE also provides direct oversight of the generating contractor personnel to ensure process integrity is maintained, is</p> |

|          |             |               | <p>certification; and waste transportation?</p> <p>c. Other than contracting, what role does DOE play in the waste certification process?</p> | <p>objective, and is technically sound. Various field surveillances, management assessments, and formal audits are conducted to ensure all facets of the waste characterization and waste certification processes are technically sound.</p> <p>Through the FFA (DOE/OR-1014, <i>Federal Facility Agreement for the Oak Ridge Reservation</i>), the FFA parties are required to participate in the WAC attainment process. The FFA parties provide oversight of the CERCLA Projects and landfill operations, including WAC Attainment Team decisions to authorize waste lots for disposal. The FFA parties may also conduct investigations and perform audits.</p> <p>The FFA Parties must review the waste handling plans developed by the waste-generating projects. Approval of the waste handling plans requires the FFA parties to reach consensus on the waste characterization sampling and analysis plan (SAP)/quality assurance program plan (QAPP) developed by the projects. As part of the characterization process, data quality objectives (DQOs) established for each waste lot require agreement by EPA, TDEC, and the DOE Oak Ridge Office of Environmental Management before waste is characterized.</p> <p>c. DOE provides direct oversight of both the waste generating activities, as well as the waste certification process. This oversight includes review of waste profiles, characterization data, sum of fractions, volume estimates, and RCRA/TSCA compliance, as well as participating in generating project DQOs, DQAs, data sharing sessions, etc. Formal and informal assessments of the characterization, certification and disposal operations are conducted on a regular basis as determined in the annual ORME Integrated Assessment Schedule (IAS) and all oversight actions, as well as issues are tracked in DOE systems until they</p> |

|          |             |                                                                      | <p>d. Would DOE be willing to consider more independent review of WAC compliance by trained personnel not employed or subcontracted by the contractor that builds and operates the landfill?</p> <p><sup>15</sup> Available at <a href="https://www.energy.gov/ea/downloads/enterprise-wide-assessment-department-energys-packaging-and-shipping-radioactive-waste">https://www.energy.gov/ea/downloads/enterprise-wide-assessment-department-energys-packaging-and-shipping-radioactive-waste</a>.</p>                                                                                                                                                           | <p>are verified as closed and effective.</p> <p>d. The WAC attainment process is a co-owned process that involves multiple organizations, each with specific responsibilities. The profile approval is the final step in a shared process that has detailed involvement by the FFA Parties. Opportunity for independent assessment by Regulatory parties who are familiar with the process and facilities would be more effective.</p>                                                                                                                                                                          |
| W        | 72          | Section 2.12.2.3, Page 2-40, 2 <sup>nd</sup> paragraph after bullets | TDEC and EPA should be involved in defining and approving operations-based WAC. If operational constraints are intended to protect the public and the environment to DOE standards and not CERCLA requirements, the ROD should state such constraints are not being relied on for CERCLA compliance.                                                                                                                                                                                                                                                                                                                                                              | <p>Clarification provided. The purpose of the operations-based requirements is not to provide protectiveness to the public, but to protect the features of the landfill (e.g., the liner and equipment). The text has been revised to indicate the operations-based requirements are not relied on to meet CERCLA protectiveness.</p> <p>See also response to Comment 64.</p>                                                                                                                                                                                                                                   |
| W        | 73          | Section 2.12.2.3, Page 2-40, Administrative WAC                      | This paragraph states hazardous waste must be treated to meet LDRs before disposal. Using mercury as an example, how much contaminant mass would the LDRs allow to be disposed in EMDF?                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Clarification provided. There is a finite amount of waste that will be generated during the cleanup of Y-12 that may contain trace amounts of mercury. This will be waste that passes TCLP (e.g., is <u>not</u> characteristically hazardous for mercury) and would therefore be eligible for disposal in any solid waste landfill (if it were not radiologically contaminated).                                                                                                                                                                                                                                |
| W        | 74          | Table 2.4, Page 2-41, EMDF Administrative WAC                        | <p>a. Wherever possible, the table should cite legal requirements rather than Triparty (FFA Party) agreements. Those requirements should be included as ARARs in Appendix A of the ROD, which will become the final agreement upon approval by the FFA Parties.</p> <p>b. Administrative WAC in Table 2.4 should prohibit onsite disposal of reactor components, process equipment/piping, and laboratory equipment. This would be consistent with the Secretary of Energy's statement during a Congressional hearing on May 6, 2021 that the EMDF is designed to hold low-risk construction waste from building demolition at Y-12 and ORNL.<sup>16,17</sup></p> | <p>a. Agree. Legal requirements should be cited and used as WAC wherever possible. See comment responses below.</p> <p>b. Clarification provided. If the stated components have radiological contamination that meets the WAC, and they can be processed, if needed, to meet operational requirements (e.g., a size issue, for example length of piping), there is no reason to prohibit them from disposal. The WAC are the driving factor on what/what is not acceptable for disposal. In the past, some of these types of components/equipment have been shipped offsite for disposal since they did not</p> |

|----------|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |               | <p>c. The second row should cite the definition of radioactive waste in Tenn. Comp. R. &amp; Regs. § 0400-20-11-.03(21), which specifically excludes transuranic (TRU), high level (radioactive) waste (HLW), spent nuclear fuel (SNF), and 11e(2) byproduct waste. Disposal of TRU waste at EMDF would also be prohibited by Public Law 102-579, The Waste Isolation Pilot Plant [WIPP] Land Withdrawal Act.</p> <p>d. In addition to listing NRC Class C limits for certain radionuclides in Table 2.4, list all numerical WAC in a single table. This could be in addition to or in lieu of inventory limits in Table 2.5 and intrusion-based activity concentration limits in Table 2.6. The table should include limits for all relevant radionuclides and chemicals, including limits derived from LDRs and other ARARs. TDEC provided a template for such a table for DOE consideration on August 26, 2021.</p> <p>Criteria for disposal of hazardous waste constituents are presented in WAC for every DOE and commercial low-level radioactive waste (LLRW) facility researched by TDEC, including EMWMF. Some implementation details may be presented in the WAC compliance plan, but the EMDF ROD needs to provide more detail regarding waste types to be addressed by the CERCLA remedy. Pending agreement on the ARARs to be included in the ROD, uncertainty remains about administrative WAC.</p> | <p>meet the EMWMF WAC. The same process would be followed for EMDF.</p> <p>c. Agree. Text has been revised to add the definition as suggested.</p> <p>d. Disagree. DOE has provided an updated table for consideration that includes a more extensive list of radionuclides. DOE has agreed with TDEC to conduct a supplemental analysis based on alternate assumptions regarding future landfill performance and exposure pathways. This supplemental analysis and results will inform development of the WAC Compliance Plan and landfill design. However, DOE does not agree that chemical “limits derived from LDRs or other ARARs” should be listed in the ROD. The LDRs (which are ARARs) and other ARARs addressing contaminants (such as PCB limits) are sufficient as provided in the ARARs tables in Appendix A of the ROD and are pointed out under the administrative WAC Table 2.6 as well. Providing information regarding the ARARs as requested by this comment is akin to re-writing the regulations. The regulations require testing and analysis to come to a determination regarding the need for treatment of a particular waste. The regulations do not simply state a numerical limit that is applicable to a solid waste, which could be inserted into a table.</p> <p>The waste that will be accepted in EMDF will result from the remediation of buildings and soils/sediment at Y-12 and ORNL. Thorough process knowledge associated with the facilities and possible contaminants exists, unlike at commercial LLW disposal facilities</p> |

|----------|-------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |               | <p>e. The fourth row of the table should cite Tenn. Comp. R. &amp; Regs. § 0400-20-11-.17(7)(a) in its entirety—not just the sixth paragraph. For example, the fourth paragraph addresses the capability of waste to detonate, decompose explosively, or react with water; and the eighth paragraph addresses infectious material.</p> <p>f. The fifth row of the table should cite Tenn. Comp. R. &amp; Regs. § 0400-20-11-.17(3)(d), (7)(b)(1), and (7)(b)(3), which should be listed as ARARs in Appendix A in lieu of citing a negotiated agreement.</p> <p>g. In the last row of the table, DOE should consider adding Tenn. Comp. R. &amp; Regs. § 0400-20-04-.04(1)(uuu) [10 CFR 150.11(a)] as an ARAR. The rule</p> | <p>that do not have an understanding up front of the possible contaminants that will be disposed of. Additionally, a wealth of experience has been gained in operating EMWMF and disposing of some wastes from Y-12 and ORNL as well as ETTP.</p> <p>Please also see the response to Comment 81 that discusses the topic.</p> <p>e. Clarification provided. Paragraphs (1), (2), and (3) cover packaging of LLW and also touch on liquids. Prohibition on liquid waste [paragraph (3)] is already stated in row 6. (1) and (2) are general requirements on packaging, but not specific to the waste itself, and are included in the ARARs table, but are too non-specific to list as administrative WAC. However, they are in the ARARs table, and therefore they must be and will be followed. Paragraph (4) speaks to reactive/explosive material prohibitions, therefore they are given as Administrative WAC. Paragraph (5) is reactive and has been added to the administrative WAC table [now Table 2.6].</p> <p>f. Agree. TDEC 0400-20-11-.17(7)(b)(1) and (3) are added to row 5. TDEC 0400-20-11-.17(3)(d) addresses how waste is placed in the landfill, and is therefore not an acceptance criteria per se and does not belong in the Administrative WAC table; however, it is an ARAR and therefore is followed by operations activities/personnel.</p> <p>g. and h. Disagree. As stated in the ROD and discussed with FFA parties, the Safety Basis requirements are not a part of the CERCLA process. Safety Basis (including criticality) is maintained by the Safety Basis</p> |

|----------|-------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |               | <p>defines “Special nuclear material in quantities not sufficient to form a critical mass.” The federal requirement at 40 CFR 761.65(c)(6)(i)(C) should also be considered. It states, “Containers used to store both liquid and non-liquid PCB/radioactive wastes must meet all regulations and requirements pertaining to nuclear criticality safety.” This rule is an ARAR in RODs for other DOE CERCLA landfills, including the EMWMF<sup>18</sup> and the Portsmouth On-Site Waste Disposal Facility (OSWDF).<sup>19</sup></p> <p>h. In addition, it is reasonable for the ROD to include more detail, or at least commit to providing more detail in the WAC compliance plan. Similar documents provide such information for other CERCLA landfills. For example:</p> <p>EMWMF: The WAC attainment plan describes wastes for which a Criticality Safety Evaluation (CSE) shall be performed.<sup>20</sup></p> <p>Portsmouth OSWDF: The WAC implementation plan provides at least three conditions that must be met to maintain nuclear criticality safety.<sup>21</sup></p> <p><sup>16</sup> Barber, W., 2021, Granholm Backs Oak Ridge Landfill, Hears Portsmouth Contamination Concerns in Budget Hearing, <i>Weapons Complex Monitor</i>, v. 32, no. 18, May 7.</p> <p><sup>17</sup> Barber, W., 2021, EPA Taking Second Look at Planned New Landfill for Oak Ridge, <i>Weapons Complex Monitor</i>, v. 32, no. 27, July 9.</p> <p><sup>18</sup> <i>OU-13 Record of Decision for the Disposal of Oak Ridge Reservation Comprehensive Environmental Response, Compensation, and Liability Act of 1980 Waste, Oak Ridge, Tennessee</i> (DOE/OR/01-1791&amp;D3); <a href="https://doeic.science.energy.gov/uploads/F.0600.031.0184.pdf">https://doeic.science.energy.gov/uploads/F.0600.031.0184.pdf</a>.</p> <p><sup>19</sup> <i>Record of Decision for the Site-Wide Waste Disposition Evaluation Project at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio</i> (DOE/PPPO/03-0513&amp;D2); <a href="https://www.energy.gov/sites/default/files/2015/07/f24/2015%2006-30%20PPPO-03-3018616-15%20FINAL%20ROD%20for%20the%20WD%20Evaluation%20Project%20at%20POR%20TS.pdf">https://www.energy.gov/sites/default/files/2015/07/f24/2015%2006-30%20PPPO-03-3018616-15%20FINAL%20ROD%20for%20the%20WD%20Evaluation%20Project%20at%20POR%20TS.pdf</a>.</p> <p><sup>20</sup> <i>Attainment Plan for Risk/Toxicity-Based Waste Acceptance Criteria at the Oak Ridge Reservation, Oak Ridge, Tennessee</i> (DOE/OR/01-1909&amp;D3); <a href="https://doeic.science.energy.gov/uploads/F.0600.033.0087.pdf">https://doeic.science.energy.gov/uploads/F.0600.033.0087.pdf</a>.</p> <p><sup>21</sup> <i>Waste Acceptance Criteria Implementation Plan for the On-Site Waste Disposal Facility at the Portsmouth Gaseous Diffusion Plant, Piketon, Ohio</i> (DOE/PPPO/03-0728&amp;D3);</p> | <p>personnel subject matter experts and closely monitored by DOE subject matter experts, separate and apart from the CERCLA process.</p> <p>OREM takes the responsibility of nuclear safety, including criticality safety, very seriously. Because the EMDF is a low level facility, the waste by definition contains only low levels of radioactive material. As such, criticality safety is not a concern. However, DOE aggressively evaluates and controls the nuclear safety even for this low level disposal facility, but outside of the CERCLA process. As part of this DOE process, the EMDF will be maintained as a Radiological Facility (i.e., less than a Category 3 Nuclear Facility) so all radionuclide inventories will be far below the quantities needed to support a criticality event.</p> |

| W        | 75          | Section 2.12.2.3, Page 2-42, Analytic WAC, 2nd paragraph on page | <p>The D1 ROD cites the PA as the basis for inventory limits intended to protect people if contaminants are released to groundwater and Bear Creek in the future. The D1 ROD is a CERCLA document, but it does not provide WAC for chemicals and radionuclides that are demonstrated to be protective of public health in accordance with the CERCLA threshold criterion. The PA is not a CERCLA document, and it does not address non-radiological contaminants, such as mercury and PCBs. The review enclosed with TDEC’s October 15, 2020 letter highlights the state’s concerns about applying the PA as the sole basis for a CERCLA decision.</p> <p>A letter from DOE to TDEC dated February 4, 2021 (revised March 8, 2021 with no date change) states “the CERCLA process is a separate regulatory path from the DOE O 435.1 process that ensures protectiveness through the PA and CA evaluations, and the development of the WAC will be addressed with the FFA Parties outside of DOE O 435.1 efforts.” During May, July, August, and September 2021, DOE hosted several 60- to 90-minute sessions during which TDEC proposed approaches to develop WAC that satisfy CERCLA’s protectiveness criterion in a defensible and transparent manner. The goal of TDEC’s recommendations was to derive WAC shown to be protective for groundwater and surface water within EPA’s risk management range of 1x10<sup>-4</sup> to 1x10<sup>-6</sup> cumulative ELCR and HI less than or equal to 1.<sup>3</sup></p> <p>The last sentence of the cited paragraph states inventory (WAC) limits in Table 2.5 are the maximum public doses allowed by Tenn. Comp. R. &amp; Regs. § 0400-20-11-.16(2) [10 CFR 61.41]. The paragraph should also acknowledge the ARAR states “Reasonable effort shall be made to maintain releases of radioactivity in effluents to the general environment as low as is reasonably achievable.” As noted in the EPA Administrator’s DRD, limits set in accordance with this ARAR can be used in combination with the ALARA approach to produce radionuclide effluent concentrations that would be as stringent as those derived through application of CWA and TWQA regulations, ensuring protectiveness of human health and the environment consistent with CERCLA.</p> <p>The last sentence of the paragraph also states the public protection annual dose limits derived from Tenn. Comp. R. &amp; Regs. § 0400-20-11-.16(2) [10 CFR 61.41]—i.e., 25 millirem (mrem) to the whole body, 75 mrem to the thyroid, and 25 mrem to any other organ of any member of the public—have been deemed protective under CERCLA by EPA.</p> | See responses to Comments 2g (related to management of wastewater) and 70 (related to CERCLA protectiveness and analytic WAC). |

|----------|-------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|          |             |               | <p>TDEC notes a regulation is not inherently protective; rather, protectiveness depends on compliance with the ARAR. Also, EPA provides an approximate Effective Dose Equivalent (EDE) of 10 mrem/year to assist with applying this requirement to radiation risk assessment at CERCLA sites. <sup>22</sup></p> <p>Cleanup levels based on some older ARARs that use a 25/75/25 mrem/yr standard (i.e., 25 mrem/yr to the whole body, 75 mrem/yr to the thyroid, and 25 mrem/yr to any other critical organ) may appear to permit greater risk than those based on 15 mrem EDE but on average correspond to approximately 10 mrem/yr EDE, using current risk methodologies.</p> <p>TDEC provided a template for a WAC table for DOE's consideration on August 26, 2021 that included groundwater pathways analytic WAC based on RESRAD-OFFSITE single radionuclide soil guidelines that are derived from ELCR calculations employing radionuclide slope factors.</p> <p>TDEC recognizes that DOE must also comply with DOE Orders and other Directives and may choose to apply Derived Concentration Standards (DCS) as metrics for operating a landfill, but DCS are not directly relevant as a basis for demonstrating compliance with CERCLA threshold criteria such as the risk management range. If DOE wants to base a CERCLA protectiveness demonstration, in part, on DOE Directives, those Directives must be listed in the ROD as TBC.</p> <p>Landfill wastewater discharge limits based on the CWA and the 10-millirem (mrem) EDE supported by EPA guidance, per the EPA Administrator's DRD, will be more protective than DCS values, which are based on an annual dose limit of 100 mrem. All landfill wastewaters must be treated using technologies agreed by the FFA Parties to meet discharge limits that are protective of human health and the environment under CERCLA for each contaminant present.</p> <p>Additionally, DCS values establish media-specific concentration limits for a single exposure pathway, such as ingestion of water or inhalation of air. They do not include all relevant and applicable exposure pathways that would be considered under CERCLA, such as fish ingestion. Nor do DCS address concerns for bioaccumulation, biomagnification, or chemical toxicity which are pertinent to projected EMDF contaminants such as mercury and PCBs. Moreover, the DOE standard clearly states that DCS "are not intended to be used to infer the dose to members of the public, nor to demonstrate compliance with DOE radiation protection dose limits."</p> |          |

| W        | 76          | Section 2.12.2.3, Page 2-42, Analytic WAC, 2nd paragraph on page & Table 2.5 | Table 2.5 presents inventory limits for only three highly mobile radionuclides, which is not adequate, as outlined in the review enclosed with TDEC’s October 15, 2020 letter and summarized in Comment 70. Inventory limits may be warranted for additional radionuclides, including those listed in Attachment 1 to TDEC’s June 15, 2020 WAC comments. The table provides a list of radionuclides that may need inventory limits to protect people who eat fish caught downstream of EMDF in the future. TDEC provided a template for such a table for DOE consideration on August 26, 2021.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Agree. The analytic WAC table (Table 2.7 in the D2 ROD) has been expanded to include the full set of radionuclides considered in the PA analyses. DOE has agreed to perform a supplemental analysis based on alternate assumptions regarding future landfill performance and exposure pathways. This supplemental analysis and results will inform development of the WAC Compliance Plan and landfill design.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| W        | 77          | Section 2.12.2.3, Page 2-42, Analytic WAC, 2nd paragraph on page             | <p>a. The first sentence of the cited paragraph states the PA evaluated a conservatively estimated radionuclide inventory to predict potential exposure/dose to future hypothetical receptors. TDEC understands the PA introduces some conservatism in the total inventory limit WAC by assuming 2.2 million cubic yards (cy) of waste will be placed in EMDF, even though the volume of waste projected for disposal is only 1.6 M cy.</p> <p>TDEC appreciates ongoing efforts to develop WAC shown to be more protective in a CERCLA context because TDEC remains concerned about the inventory uncertainties acknowledged in the PA. In part, this is because some waste lots projected for disposal have yet to be fully characterized. Another concern is the use of data from unspecified EMWMF waste lots derived primarily from ETPP to estimate radionuclide concentrations in future EMDF waste streams to be generated primarily at Y-12 and ORNL. This is particularly concerning given that radioactivity is tracked for only 13 radionuclides at EMWMF. An additional concern is that EMDF WAC will be developed based on assumptions that future waste lots will contain lower amounts of radionuclides than might actually be encountered. In this case, it is unclear that future waste characterization efforts will adequately address potential risks to public health and the environment, given that such</p> | <p>a. Clarification provided. The comment states “<i>Another concern is the use of data from unspecified EMWMF waste lots derived primarily from ETPP to estimate radionuclide concentrations in future EMDF waste streams to be generated primarily at Y-12 and ORNL. This is particularly concerning given that radioactivity is tracked for only 13 radionuclides at EMWMF. An additional concern is that EMDF WAC will be developed based on assumptions that future waste lots will contain lower amounts of radionuclides than might actually be encountered.</i>” The EMWMF waste lots used as a basis for the projected inventory in EMDF were Y-12 and ORNL waste lots disposed of in EMWMF; therefore, they are very representative of future waste from those facilities (ETPP waste lots were not used to project inventory in EMDF). The Performance Assessment (PA) and QA Report for the PA were provided to TDEC and are included in the Administrative Record. The information on the waste lots used to help project EMDF waste disposal are</p> |

|----------|-------------|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |                                                         | <p>efforts are outside the scope of this decision and WAC compliance will be addressed in a future (post-ROD) document. The result could be more radioactivity in EMDF for potential release in the future. Even more concerns regarding inventory uncertainties are provided in a review of the PA enclosed with TDEC’s October 15, 2020 letter to DOE.</p> <p>b. Based on a workshop held on July 22, 2021, TDEC understands a “waste lot” will be the unit of the waste used to determine WAC compliance for disposal in the EMDF and the ROD will be revised to clarify this point. “Waste lot” should be defined or explained in the ROD. Discussion of “waste packages” may still be warranted in other contexts.</p> <p>The last sentence in the paragraph states the PA did not evaluate any future residential scenario in which there is direct exposure to the waste. However, TDEC remains concerned erosion with the potential to degrade the cap was not modeled realistically. Moreover, a resident need not have a basement or directly contact the waste to be exposed to radiation. For example, if the waste is just below a basement floor, there could be exposure without direct contact.</p> | <p>discussed in those documents. Additional information for facilities that are to be remediated and waste disposed in the proposed EMDF, such as Safety Basis documents, provided information regarding expected radionuclide contaminants and quantities as well, which provided information beyond the 13 EMWMF WAC radionuclides.</p> <p>Inventory limits will be used to help ensure protectiveness is maintained as waste is accepted throughout the operation of the facility. It is expected that deviations from the assumptions of future waste contaminants will occur, and continuous monitoring of the ability of the accumulating inventory to meet the CERCLA risk range will ensure protectiveness continues to be achieved through closure.</p> <p>b. A footnote has been added in Sect. 2.12.2.3 to define “waste lot.”</p> <p>The scenario used to develop the Waste Lot Concentration Limits is sufficiently conservative and consistent with DOE and NRC guidance on the adoption of inadvertent human intrusion analyses for setting radionuclide concentration limits.</p> |
| E        | 78          | Section 2.12.2.2, Page 2-43, 4th full paragraph         | <p>Modify the first sentence of the cited paragraph to read:</p> <p>The basis for WAC use and implementation will be detailed in the WAC Compliance Plan, which will be an FFA primary document with a schedule milestone in Appendix E of the FFA.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Agree. Text revised as suggested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| W        | 79          | Section 2.12.2.3, Page 2-43, 2nd full paragraph on page | The first sentence of the cited paragraph states intrusion-based WAC concentration limits do not dictate the amount of a radionuclide allowed for                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Clarification provided. The text of Sect. 2.12.2.3 has been revised to clarify the difference in the basis for and the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|          |             |                                                         | <p>disposal because they are evaluated (averaged) for the landfill as a whole.</p> <p>Waste acceptance limits based on intrusion scenarios should be hard limits on a per-package or per-truckload basis since these scenarios are based on exposure to waste in discrete areas of the landfill. Based on the information presented in the D1 ROD, some of these limits would allow large inventories of radionuclides to be disposed, since DOE has proposed to limit the total inventory limits for only the three radionuclides listed in Table 2.5.</p> <p>Total inventory limits are needed for additional radionuclides to protect from future risks posed by contaminants transported in groundwater and/or surface water. For example, the U-238 limit in Table 2-6 would allow for disposal of much more U-238 than is in the projected inventory of waste to be disposed at EMDF, and it would also allow for disposal of much more uranium than was disposed in the BCBG. TDEC will continue working with DOE to develop more complete and defensible WAC based on CERCLA requirements and guidance.</p> | <p>application of WLCL and LFIL.</p> <p>Most waste accepted for disposal will not be containerized. GTCC administrative WAC are not applied to individual containers because LLW disposal restrictions based on NRC waste classifications (10 <i>CFR</i> 61.55) are not ARAR for EMDF. Class C concentration limits are adopted as administrative WAC applied to waste lots.</p> <p>The analytic WAC table (Table 2.7 in the D2 ROD) has been expanded to include the full set of radionuclides considered in the PA analyses. DOE has agreed to perform a supplemental analysis based on alternate assumptions regarding future landfill performance and exposure pathways. This supplemental analysis and results will inform development of the WAC Compliance Plan and landfill design.</p> |
| W        | 80          | Section 2.12.2.3, Page 2-43, 3rd full paragraph on page | <p>The third sentence in the paragraph requires clarification. It states activity concentration limits in Table 2.6 could allow a much greater inventory than is projected, but the limits will be applied on individual waste lots to optimize use of the facility. Explain how activity concentrations that could allow more than the projected radionuclide inventory are "limits." Also, clarify where it is shown that maintaining a sum-of-fractions at 1 for the entire facility ensures the CERCLA risk range is met at closure, as stated in the last sentence of the paragraph.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Clarification provided. For either waste lot concentration limits or landfill inventory limits, the proposed limits are larger than the projected average waste concentrations or total activity inventories, and there is no inconsistency in the text regarding that difference. The comment appears to imply that the ROD text proposes applying waste lot concentration limits as total inventory limits (i.e., <i>facility average</i> concentration limits), which is incorrect. The text explicitly states that waste lot concentration limits are not applied to the facility as a whole.</p>                                                                                                                                                                                        |

| W-R      | 81          | Section 2.12.2.3,<br>Page 2-43, 4th full<br>paragraph on page | <p>The last sentence in the paragraph states the WAC Compliance Plan will outline a method for managing a situation in which waste proposed for disposal contains a radionuclide that had not been previously evaluated through PA modeling or included in the WAC.</p> <p>TDEC is concerned that radionuclides for which WAC have not been proposed may be present in a waste lot but not discovered if waste characterization is driven solely by existing WAC. For this reason, TDEC recommends applying a more thorough analyte list for initial characterization of individual waste lots and/or particular waste streams originating from various processes, modified as appropriate where process knowledge can be used to rule out the presence of some radionuclides. Waste Handling Plans (WHPs) for waste that may be disposed in EMDF would specify a thorough analyte list for initial characterization of relevant portions of the waste lot, but they would also allow use of an optimized analytical suite for the remainder of the waste lot if supported by the data.</p> <p>Adopting this approach as part of the waste management remedy selected by the EMDF ROD would minimize the chance of failing to account for unexpected radionuclides in the waste. As noted in the PA, some radionuclides were not evaluated precisely because of a lack of data. Therefore, process knowledge may not be sufficient to make protective waste characterization decisions on a project-specific basis.</p> | <p>Clarification provided. Waste characterization is not driven solely by the WAC, and while process knowledge is usually thorough and provides a solid basis for expected contaminants, it is not the only basis for defining characterization. A process is followed, in which a waste lot is thoroughly vetted through the Data Quality Objective process, and characterization is conducted to confirm process knowledge of the contaminants of concern. Gross alpha/beta/gamma scans are conducted as part of that characterization process, and if activities are noted that are not accounted for by the radionuclides analyzed per process knowledge, additional analysis would be required.</p> <p>The analytic WAC table (Table 2.7 in the D2 ROD) has been expanded to include the full set of radionuclides considered in the PA analyses. DOE has agreed to perform a supplemental analysis based on alternate assumptions regarding future landfill performance and exposure pathways. This supplemental analysis and results will inform development of the WAC Compliance Plan and landfill design.</p> |

|----------|-------------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| W        | 82          | Section 2.12.2.3, Page 2-43, last paragraph on page | The paragraph states DOE will maintain the landfill in perpetuity, as required by CERCLA. Given DOE's reliance on WAC derived from the PA, which was completed under DOE Orders, the paragraph should also point out that WAC provide protection beyond the timeframe during which CERCLA reviews, monitoring, and corrective actions are expected to occur. Although the PA is based on a performance period that extends 1,000 years after closure of the landfill, it also assumes institutional controls end 100 years after closure.                                                                                                           | <p>Clarification provided. The commenter seems to indicate there is a finite time in which CERCLA reviews/monitoring and corrective actions, if needed, occur. However, per the National Contingency Plan and CERCLA, 40 <i>CFR</i> 300.430(f)(4)(ii), as long as the hazardous substances remain above levels that would allow unlimited use and unrestricted exposure, CERCLA reviews, at least every 5 years, will continue.</p> <p>The PA assumes institutional controls end 100 years after closure solely as part of the analysis, in order to allow for scenarios—that otherwise would not happen if institutional controls were in place—to be examined. It is NOT an assumption of reality and the future condition of the site. DOE commits to maintain the landfill and its contents in perpetuity, as indicated in multiple locations throughout the ROD.</p> <p>Text has been revised to note that WAC are only one line of defense, and that engineered features using natural materials, CERCLA monitoring, and corrective actions if needed, etc. all contribute to maintaining protectiveness of the facility.</p> |
| W        | 83          | Table 2.6, Page 2-44                                | <p>a. Add a footnote clarifying the maximum volume over which the limits in the table apply.</p> <p>b. Activity concentration limits presented in the table would allow radionuclides to comprise a significant portion of the total landfill mass. For long-term protectiveness, inventory limits like those presented in Table 2.5 may be warranted for isotopes of uranium, thorium, and others that contribute substantially to the total mass allowed by the concentration limits in Table 2.6.</p> <p>c. As a primary COC at Y-12 found in multiple buildings planned for demolition, beryllium metal also warrants limits. The EMWMF WAC</p> | <p>[Note that the information is now found in Table 2.7].</p> <p>a. A footnote was added stating: "Maximum volume over which Waste Lot Concentration Limits will be applied will be the largest expected waste lot volume containing that COC."</p> <p>b. See response to Comment. 70.</p> <p>c. A similar requirement for beryllium waste will be included in the WAC Compliance Plan for EMDF.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|----------|-------------|--------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |                                                                          | <p>includes a requirement for beryllium to be wetted, double-bagged in quantities not to exceed 40 pounds and shipped separately or with adequate soil.</p> <p>d. According to the D5 RI/FS (Table 2-9), beryllium is among the chemicals which have been found in the waste disposed at EMWMF. The RI/FS also projects that beryllium will be in the EMDF waste inventory, and considerable beryllium contamination is present at Y 12.<sup>23</sup> However, the only criterion listed in the D1 ROD is an intrusion-based limit for beryllium-10 (Table 2.6). The concern is potential harm from inadvertent intrusion, given the documented role beryllium plays in lung diseases among DOE workers.<sup>24</sup></p> <p>e. Separately, WAC may be warranted to manage beryllium’s potential to pose nuclear criticality safety hazards due to its function as a neutron moderator and a neutron reflector, both of which increase the likelihood of fission.</p> <p>DOE established requirements for beryllium at CERCLA landfills, including EMWMF and the Portsmouth OSWDF, and it is a component of the WAC at DOE’s NNSS and WIPP, as well as the EnergySolutions facility in Utah and the Waste Control Specialists (WCS) facility in Texas.</p> <p><sup>23</sup> URS   CH2M Oak Ridge LLC (UCOR), 2015, <i>Considerations for Characterization, Pre-demolition, and Disposition of Y-12 Mercury-Contaminated Debris, Oak Ridge, Tennessee</i>, UCOR-4653/R1, June.</p> <p><sup>24</sup> For example, see <a href="https://www.cdc.gov/niosh/ocas/ocaseoi.html">https://www.cdc.gov/niosh/ocas/ocaseoi.html</a>.</p> | <p>d. Clarification provided. See response to item c. above.</p> <p>The ROD demonstrates that design and hazardous waste disposal ARARs ensure protectiveness of the remedy with respect to hazardous waste constituents. As noted in the response to Comment 74, DOE implements a rigorous nuclear safety program, including criticality safety, outside of the CERCLA process. See response to comment c above. In addition, CERCLA requires that the site be maintained in perpetuity with 5-year reviews and regular maintenance to maintain the remedy. These CERCLA controls prevent the risk to an inadvertent intruder.</p> <p>e. Clarification provided. See response to item c. above.</p> <p>The DOE sites cited in the comment typically deal with much higher level waste. As noted in the response to Comment 74, the proposed EMDF is a much lower level waste disposal site.</p> |
| W        | 84          | Section 2.12.2.3, Page 2-45, 1st paragraph after bullet near top of page | TDEC and EPA should be involved in defining and approving operations-based WAC. Solid and hazardous waste rules include substantive operational requirements for permitted facilities. The D1 ROD provides no justification for ceding all authority on physical WAC and other operations-based protections to DOE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Clarification provided. See response to Comment 64. Additionally, several ARARs that are “substantive operational requirements” were added to the Administrative WAC (Table 2.6 in the D2 ROD). Please note that even if a specific ARAR is not in the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|          |             |                                        | <p>Alternatively, the ROD should explain how EMDF operations will differ from EMWMF, where operations-based criteria are part of the facility WAC. Experience at EMWMF demonstrates regulatory approval of operations controlling precipitation run-on/run-off and physical WAC impacting the long-term stability of the waste should involve regulatory review and approval. Any waivers from such requirements should be agreed by TDEC and EPA. If operational constraints are intended to protect public health and the environment to DOE standards and not CERCLA requirements, the ROD should state such constraints are not being relied on for CERCLA compliance.</p>                                                                                                                                                                                                                                                               | <p>Administrative WAC table, if it is in the ARARs table, it is required to be followed.</p> <p>See the Administrative WAC , which contains requirements that help maintain stability in the landfill. Operations personnel are held to the ARARs that affect the stability of the landfill through the incorporation of those ARARs in the ROD. Additionally, operating procedures (that exist now for EMWMF) over and above ARARs dictate how stability in the landfill is maintained and verified on a routine basis. There will not be any substantive difference between operations at EMDF versus EMWMF.</p> <p>The D2 ROD Sect. 2.12.2.3 text has been revised to indicate the operations-based requirements are not relied on to ensure CERCLA protectiveness.</p> |
| M<br>W-M | 85          | Page 2-45, Mercury Management Approach | <p>a. This section lacks the necessary detail for a ROD. As noted in TDEC’s general comments, the absence of specific remediation goals in surface water as required by 40 CFR 300.430(f)(4)(iii)(A) prevents proper evaluation of this section.</p> <p>b. The approach to mercury management in the D1 ROD states DOE will treat and dispose of all mercury hazardous waste offsite, so D009 waste should be excluded by the administrative WAC in Table 2.4.</p> <p>c. Although the D1 ROD would prohibit disposal of D009 mercury waste, large volumes of untreated mercury-bearing waste could be disposed at concentrations below the LDR. Such waste should be treated and/or disposed offsite, or the ROD should indicate how much mercury the EMDF will accept.</p> <p>d. Bioaccumulative parameters such as mercury require loading limits as well as concentration limits to protect aquatic life. A loading limit for mercury</p> | <p>a. Section was replaced by the EIT Mercury Management Approach.</p> <p>b. Agree. The administrative WAC table has been modified to include the FFA Party-negotiated prohibition of D009 characteristically hazardous mercury waste from disposal in EMDF.</p> <p>c. Clarification provided. LDRs were set to be protective of the environment from those contaminants covered by the regulations, including mercury. Within the regulations, there are no further limits applied to wastes that pass TCLP, and such waste could be disposed of in solid waste disposal facilities. There is no basis for setting additional mercury limits for waste that passes TCLP.</p> <p>d. Agree. This section was replaced by the complete EIT</p>                               |

| M        | 86          | Page 2-45, Mercury Management Approach, 2nd bullet, 1st sub-bullet | <p>a. This text disregards Bear Creek’s inclusion on the state’s List of Impaired and Threatened Waters for mercury, thereby requiring application of Tenn. Comp. R. &amp; Regs. § 0400-40-03-.06 for antidegradation. An antidegradation calculation and approach must be developed to discharge mercury into Bear Creek, as well as PCBs, which are also bioaccumulative in fish.</p> <p>b. In addition to mercury and PCBs, the ROD should also acknowledge that Bear Creek is impaired for cadmium and nitrate/nitrite.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>a. Clarification provided. After the D1 ROD, the mercury management approach was developed by the three FFA parties. This section was replaced with the final mercury agreement, including discussions of antidegradation approach.</p> <p>Additional text was added to the ROD to discuss the PCB Management Approach.</p> <p>b. Clarification provided. See response to Comment 86a. In addition, a footnote has been added in Table A.1 acknowledging that Bear Creek is not meeting its recreational use for nitrites/nitrates and cadmium in water.</p> |
| D        | 87          | Page 2-45, Mercury Management Approach, 2nd bullet, 2nd sub-bullet | <p>The second sub-bullet references meeting the “most stringent applicable water quality criteria, including recreational, with consideration of the stream mixing zone at the point of discharge.”</p> <p>a. Tenn. Comp. R. &amp; Regs. § 0400-40-03-.05(2) should be added to the ARAR list. This rule includes seven restrictions for the application of a mixing zone that must be considered. In addition, a mixing zone cannot be applied to the discharge of bioaccumulative pollutants for which risk-based factors are exceeded.</p> <p>b. How will it be determined which parameters require discharge limits? In the past five years, more than 250 constituents have been analyzed in EMWWMF leachate.</p> <p>c. Many constituents have no state or federal AWQC. When developing the most appropriate discharge limits and ARAR list for the EMDF ROD, DOE must consider all state and federal regulations, including but not limited to effluent limitation guidelines; state anti-degradation regulations for all parameters included on Tennessee’s list of impaired and threatened waters, known as “the 303(d) list”; Best Available Technology Economically Achievable;<sup>25</sup> Water-Quality Based Effluent Limit (WQBELs); and Technology Based Effluent Limits (TBELs).</p> <p>d. Per the EPA Administrator’s decision, “the point of compliance for meeting</p> | See response to Comment 86.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| O        | 88          | Page 2-45, Mercury Management Approach, 2nd bullet, 3rd sub-bullet | Elaborate on water management practices that could be considered to “reduce the volume of water needing treatment.”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Clarification provided. The FFA parties have agreed on the mercury approach for EMDF. This section has been replaced with the final EIT mercury management approach, which is summarized in the response to Comment 2e.                                                                                                                                                                                                                                                                                              |
| O        | 89          | Section 2.12.2.4, Page 2-46, 1st paragraph                         | TDEC appreciates prioritization of minimizing the disposal of clean material in the proposed EMDF. However, the ROD should clarify how a goal within the document meets this commitment when waste-generating projects are not within the scope of the EMDF ROD, as stated in Section 2.4 (p. 2-11).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Agree. Text has been added to clarify how this goal is followed in the OREM cleanup program.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| O        | 90          | Section 2.12.2.4, Page 2-46, 2nd paragraph                         | <p>a. The waste disposal remedy selected in the ROD must address CERCLA’s preference for cleanup through active treatment of all landfill wastewater.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>a. Clarification provided. See response to Comment 62a where this comment is addressed in Sect. 2.12.1; text was added as follows: “CERCLA’s preference for treatment is also addressed by treatment of landfill wastewater to meet ARARs and discharge limits prior to release.”</p> <p>b. Clarification provided. The leachate/contact water storage tanks are shown in Fig. 2.6 [previous Fig. 2.5]. Storage capacity will meet ARARs, and additional consideration was given to increased volume based on</p> |

|          |             |                                            | <p>b. What are DOE's plans for landfill wastewater storage capacity at EMDF? Regarding design considerations, the March 4, 2021 EMDF Leachate/Contact Water Treatment Overview states, "Minimum requirement is a 25-year 24-hour storm event, but additional consideration has been given to both 100-year 24-hour storm and historical precipitation" and "The most challenging storage tank/collection pond fill scenarios are driven by the back-to-back storm conditions from 2003." 2003 was an extremely wet year, but the past two years have experienced similar rainfall. Per the 2021 RER (see chart below), rainfall in federal Fiscal Year (FY) 2020 was 20 inches greater than the 30-year average. Precipitation levels similar to those in 2003 are no longer extreme events, but rather the norm, and this must be taken into consideration for storage and treatment design.</p>  | <p>recent heavy precipitation periods and potential future increased precipitation. The volume will be described in the post-ROD Remedial Design Report that will be provided for FFA Party review and approval, but is anticipated to include multiple 500,000-gal storage tanks.</p> |
| D        | 91          | Section 2.12.2.4, Page 2-46, 4th paragraph | <p>a. The text states radiological discharge limits comply with the 10-5 risk. The ROD must document how this compliance is demonstrated or cite a document in the Administrative Record that provides the assessment.</p> <p>b. The text states, "Compliance with ARARs is required at the nearest point of public exposure, which is downstream from the facility." Revise the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>a. Agree. Section 2.12.2.4 of the D2 ROD includes the FFA parties' agreement on protective PRGs/cleanup levels for EMDF wastewater.</p> <p>b. Agree. Text revised as suggested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| O        | 93          | Section 2.12.4, Page 2-49, 1st paragraph | The text states EMDF construction at the CBCV site provides onsite disposal that will be protective of human health and the environment and waste disposal in EMDF will protect human and ecological receptors. The ROD must document how this protectiveness is demonstrated in accordance with CERCLA or cite a document in the Administrative Record that provides the demonstration(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Clarification provided. Protectiveness is documented throughout the ROD, but explicitly in Sect. 2.10.1 Overall Protection of Human Health and the Environment (including Table 2.2) and Sect. 2.13.1 Overall Protection of Human Health and the Environment (specific to the selected remedy). In addition, detailed discussion of how the remedial action objectives are attained is now provided in Sect. 2.12.4, including references to analysis performed and previously documented. Section 2.9 provides a summary of the RI/FS previously performed. Section 2.10.3 describes the long-term effectiveness and permanence of the remedy. Section 2.12.2.3 contains two graphs that illustrate the CERCLA risk range is met and protectiveness provided by the remedy.</p> <p>The following text was added to Sect. 2.12.4 as a new second paragraph: “Protectiveness of human health and environment is demonstrated in accordance with CERCLA by the following: (1) protective site conditions (Sect. 2.5), (2) protective multi-layer liner and cover design</p> |

| Category | Comment No. | Sect/<br>Page                                                   | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Response                                                                                                                                                                                                                                                                                                                                                                                |

|          |             |                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | (Sect. 2.12.2.1), (3) WAC that limit contamination in waste disposed (Sect. 2.12.2.3) and demonstrations of protectiveness under the RGW and intruder scenarios (UCOR 2020), (4) ARARs that are followed for all aspects of the remedy (Appendix A) and guide waste acceptance (Sect. 2.12.2.3), and (5) protective operations including protective discharge limits (Sect. 2.12.2.4).” |
| E        | 94          | Section 2.12.4, Page 2-49, 2nd paragraph                        | Consider providing examples of how wetland impacts might be mitigated (restoration, enhancement, preservation, creation, etc.) and/or citing the page number where the reader can find the ARARs related to wetland mitigation (e.g., page corresponding to p. A-7 in the D1 ROD).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Agree. Text revised as suggested.                                                                                                                                                                                                                                                                                                                                                       |
| O        | 95          | Section 2.13.1, Page 2-50, 1st paragraph                        | The text states the selected remedy [EMDF construction and operation] will be protective of human health and the environment. The ROD must document how this protectiveness is demonstrated in accordance with CERCLA or cite a document in the Administrative Record that provides the demonstration(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | See response to Comment 93.                                                                                                                                                                                                                                                                                                                                                             |
| A        | 96          | Section 2.13.2, Page 2-50, last paragraph on page               | This comment may not warrant a revision in the document, but TDEC agrees identification of ARARs helps ensure the selected remedy is protective of human health and the environment, as stated in the first paragraph in the section. It is unclear why the cited paragraph highlights only two TDEC regulations used to support development of landfill wastewater discharge limits when the first paragraph on p. 2 51 states all ARARs are presented in Appendix A. Modify the last sentence to state limits on radiological discharges during operations will ensure protection of human health and the environment in compliance with TDEC water quality criteria regulations for carcinogens in Footnote (c) of Tenn. Comp. R. & Regs. § 0400-40-03-.03(4)(j), which the EPA Administrator determined is a relevant and appropriate requirement. | Agree. The text has been clarified to be inclusive of all ARARs being used to develop wastewater discharge effluent limitations.                                                                                                                                                                                                                                                        |
| A        | 97          | Section 2.13.2.1, Page 2-51, Waiver to TSCA 40 CFR 761.75(c)(4) | DOE seeks a waiver of 40 CFR 761.75(b)(3) under 40 CFR 761.75(c)(4). The waiver justification is incomplete and should include a defensible demonstration that risks to the public via contaminant transport by surface water are acceptable.<br><br>Toxic Substances Control Act (TSCA) 40 CFR 761.75(b)(3) states in part, “Floodplains, shorelands, and groundwater recharge areas shall be avoided. There shall be no hydraulic connection between the site and standing or flowing surface water.” On p. 2-52, the waiver of the requirement for no hydraulic connection of the site to surface water is justified by suggesting the rule is intended to separate waste from groundwater following landfill construction. The requirement is also intended to separate waste and surface water to                                                 | Agree. Text was revised as suggested.                                                                                                                                                                                                                                                                                                                                                   |

|          |             |                                                           | minimize contaminant transport. The rule protects the public from contaminants released above the liner and subsequently transported by surface water.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| A        | 98          | Section 2.13.2.1, Page 2-52, 1st & 2nd paragraphs on page | <p>This portion of the ROD or some document in the CERCLA Administrative Record needs to provide a quantitative demonstration, as required by 40 CFR 761.75(c)(4), that the liner system and geologic buffer offer performance superior to the required 50-ft separation required by the ARAR being waived. For example, the demonstration might compare contaminant migration times for the planned design with travel times for the configuration required by the ARAR, assuming the presence of 50 ft of unsaturated material like that found at the CBCV Site 7c.</p> <p>The liner system is thicker than required and contains low-permeability synthetic components, but the argument is that the liner and geologic buffer in the preliminary design provide equivalent or better protection than required. Rather than merely specifying a minimum separation between the waste and the groundwater, the final design will specify low-permeability layers in the liner and geologic buffer that can be shown to perform better than a larger separation with no permeability specifications.</p> <p>Given the waiver standard of “unreasonable risk,” TDEC asks for a <u>quantitative demonstration</u> that the combined effect of the thicker liner system underlain by a geologic buffer with at least 10 ft of clay allowing downward movement of liquid at no more than <math>1 \times 10^{-5}</math> centimeters per second will not allow “unreasonable risk” for PCBs.</p> <p>As noted in the D5 RI/FS and the December 7, 2017 DRA (Appendix G), PCBs are relatively immobile in soil because adsorption reduces their migration. The justification for the waiver should provide a quantitative demonstration and arguments related to the properties of PCBs to show that the low-permeability materials in the liner and geologic buffer will not allow “unreasonable risk”.</p> | Agree. Text has been updated to include quantitative travel time comparison for TSCA liner and buffer to RCRA liner system with 10-ft geologic buffer (at specified k values).                                                                                                                                                                                                                                                                                                 |
| A        | 99          | Section 2.13.2.1, Page 2-52, 4th paragraph on page        | TSCA 40 CFR 761.75(b)(3) for which DOE is seeking a waiver under 40 CFR 761.75(c)(4) requires “There shall be no hydraulic connection between the site and standing or flowing surface water.” The cited paragraph states the objective of this requirement will be met by landfill construction that separates water from waste. However, the ROD (p. 2-46, second paragraph) also states EMDF landfill wastewater may be discharged directly to Bear Creek or a tributary without treatment. Considering this, explain how landfill construction will separate water from waste.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Clarification provided. EMDF landfill wastewater will undergo treatment prior to release. Since all EMDF landfill wastewater will undergo treatment prior to release, the only contaminants reaching surface water from the site will be those treated to protective levels. Thus, risk to the public via contaminant transport by surface water will not present an unreasonable risk of injury to health or the environment from PCBs. Text has been updated to include this |

| O        | 100         | Section 2.13.2.2,<br>Page 2-54, 1st<br>paragraph         | As noted in Comment 98, there should be a quantitative demonstration element to support the point about “extended travel time.” How much is the travel time extended? Do the PA or CA rely on the 15-ft vadose (unsaturated) zone to support projections of landfill performance?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Agree. See the response to Comment 98 (indicates revision to text with quantitative information).<br><br>The vadose zone is part of the modeling for landfill performance in the PA. The CA uses the PA results.<br><br>Based on EMDF PA modeling, vadose zone travel time contributes significantly to landfill performance only for those radionuclides that decay significantly over a few hundred years (e.g., H-3, Cs-137).                                                                                      |
| O        | 101         | Section 2.13.2.2,<br>Page 2-54, 3rd<br>paragraph         | The text states WAC will ensure human and environmental protectiveness are met per RAOs. The ROD must document how this protectiveness is demonstrated in accordance with CERCLA or cite a document in the Administrative Record that provides the demonstration(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | See response to Comment 70 for CERCLA protectiveness of analytic WAC.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| E<br>A   | 102         | Section 2.13.2.2,<br>Page 2-54, 4th<br>paragraph on page | <p>a. For accuracy, change “unique” to “specific” or a similar word. Descriptions throughout the draft ROD indicate EMDF will be constructed and operated similarly to the existing EMWMF, so it is not accurate to describe EMDF as a unique CERCLA remedy.</p> <p>b. As noted in previous comments, the ROD must present a quantitative demonstration that supports a finding of “undue hazard.” The waiver must be supported by more than a conclusory statement about the isolation of short-lived radionuclides to cause decay in place.</p> <p>Like the argument about the vertical buffer zone associated with the TSCA waiver, the siting requirement for a horizontal buffer zone around the disposal unit is based on distance, which is not necessarily a barrier to contaminant migration by itself. Distance, time and shielding work together to protect against radiation exposures. The CERLCA ROD relies partly on the PA/CA, but the review enclosed with TDEC’s October 15, 2020 letter highlights the state’s concerns about applying the PA as the sole basis for a CERCLA decision. In general, the concern is the PA/CA assumptions are sufficiently realistic to conclude the modeled radiation doses are within the CERCLA risk range.</p> | <p>a. Agree. Text revised as suggested.</p> <p>b. Clarification provided. Text refers back to previous quantitative results for vertical buffer between waste and groundwater and supports the decay in place for Sr-90 and Cs-137.</p> <p>DOE has agreed with TDEC to conduct a supplemental analysis based on alternate assumptions regarding future landfill performance and exposure pathways. This supplemental analysis and results will inform development of the WAC Compliance Plan and landfill design.</p> |

|----------|-------------|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E        | 103         | Section 2.13.2.3, Page 2-54, 2nd paragraph in section                          | In addition to the EPA Administrator’s DRD, the ROD should cite the final <i>Focused Feasibility Study for Water Management for the Disposal of CERCLA Waste on the Oak Ridge Reservation, Oak Ridge, Tennessee</i> (FFS), where the technical methodology for determining radiological discharge limits will be documented.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Agree. Text revised as suggested. [Note: text now found in Sect. 2.12.2.4.]                                                                                                                                                                                               |
| O        | 104         | Section 2.13.4, Page 2-55, 2nd paragraph                                       | Consider removing this paragraph or clarifying the purpose for including the two statements it contains. Text throughout the ROD (e.g., p. 2-11, third and fourth paragraphs; p. 2-17, first paragraph of Section 2.8; and Section 2.13.5) already explains exclusions from the EMDF project scope.<br><br>As presented in Section 2.13.4, the cited paragraph contradicts the premise for selecting onsite disposal outlined in the preceding paragraph and the previous section. If onsite disposal represents the most cost-effective alternative and offers economy of scale, the same benefits will accrue from consolidating decisions about resource recovery and recycling, if not waste treatment. It may make sense to remove this paragraph since the ROD scope is waste disposal rather than a more holistic approach to waste management. | Agree. The following text was deleted: “ <del>Selection of alternative treatment technologies or resource recovery is not germane to this decision. The decisions concerning treatment or recycling are the responsibility of the waste generating projects.</del> ”      |
| E        | 105         | Section 2.13.5, Page 2-56, 1st full paragraph on page                          | The single sentence in the cited paragraph states landfill wastewater treatment is a key remedy component that will reduce the <i>toxicity</i> of the waste. For accuracy, revise the text to state landfill wastewater treatment would reduce the <i>mobility</i> of contaminants released from the waste.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Agree. Text revised as follows: “Treatment of landfill wastewater from EMDF, however, is a key component of the remedy and will reduce the toxicity and mobility of the waste.”                                                                                           |
| E        | 106         | Section 2.13.6, Page 2-56 and Section 2.14, Page 2-56, 1st sentence in section | For consistency with other sections of the ROD, these sections should state 5-year reviews will be required in perpetuity. The phrase is included in Sections 2.6.2 (p. 2-16), 2.12.2.3 (p. 2-43), 2.12.2.6 (p. 2-47), and Table 2.7 (p. 2-48).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Clarification provided. Text revised in Sect. 2.13.6 to state DOE maintaining the EMDF and the use of the 5-year review process in perpetuity; however, Sect. 2.14 discusses Significant Changes from the Proposed Plan and therefore this statement was not added there. |
| C<br>E   | 107         | Section 2.14, Page 2-56, 3rd paragraph in section                              | a. This paragraph indicates DOE completed three additional evaluations in response to public comments. The document provides additional details about two of the evaluations: impacts of offsite waste disposal on ETPP reindustrialization and the production of greenhouse gases associated with offsite waste transportation. However, the document provides no such detail about the third evaluation: a re-estimation of onsite and offsite disposal costs. Such information should be included as a subsection or appendix in the ROD or another document to be included in the administrative record because it addresses a CERCLA balancing criterion and public comments on the Proposed Plan. For example, it would support                                                                                                                  | a. Agree. The re-evaluation of costs are explained in more detail, in a new subsection under 2.14 (Sect. 2.14.1).                                                                                                                                                         |

| Category | Comment No. | Sect/<br>Page             | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Response                                                                                                                                                                                                                                                                                                                                                      |

|          |             |                           | <p>the response to sub-comment #3 on p. 3-75.</p> <p>b. Remove the word “ongoing.” At the time a final ROD is signed, it will not be accurate to characterize delays in a decision as ongoing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>b. Agree. “Ongoing” was removed.</p>                                                                                                                                                                                                                                                                                                                       |
| O        | 108         | Section 2.14.2, Page 2-59 | <p>a. TDEC agrees offsite waste transportation would generate more greenhouse gas emissions than transportation associated with onsite disposal. DOE estimates excess emissions would be 113,143 carbon-dioxide-equivalent metric tons (Mt CO<sub>2</sub>e) over the 22-year project life, which is 5,143 Mt CO<sub>2</sub>e per year. For context, this is a relatively small loading of greenhouse gas, considering employees commuting to and from Y-12 generate about 3.5 times that amount, based on the most recent publicly available data from FYs 2008 and 2012 (17,447 and 18,005 Mt CO<sub>2</sub>e per year, respectively).<sup>27</sup></p> <p>Consider updating the information in Section 2.14.2. For example, the citation of EPA’s March 2018 emission factors for greenhouse gas inventories could be updated to reflect values published in April 2021. Similarly, this section cites a June 2019 version of EPA’s calculator for greenhouse gas equivalencies, which could be updated to the more recent version, dated March 2021. Updating this section would result in a moderate increase (about 20%) in the projected emissions associated with transportation to off-site facilities, but there would be negligible change (less than 1%) in the equivalencies presented.</p> <p>b. Section 2.14.2 evaluates the production of greenhouse gases associated with offsite waste transportation, but it does not consider the net increase in greenhouse gases related to the construction of a new landfill. Landfill construction equipment will emit greenhouse gases that would not be associated with offsite disposal, and additional greenhouse gases will remain in the atmosphere due to a reduction in CO<sub>2</sub> sequestration caused by deforestation of the 67-acre CBCV Site 7c. These impacts may be smaller than those associated with offsite waste transportation, but a complete evaluation would include them, particularly considering the intended permanence of the landfill footprint.</p> <p><sup>27</sup> Y-12 National Security Complex, 2012, <i>Y-12 National Security Complex FY 2013 Site Sustainability Plan</i>, U/IA-451/Rev. 1, December, p. 1-6. Available at <a href="https://digital.library.unt.edu/ark:/67531/metadc844673/">https://digital.library.unt.edu/ark:/67531/metadc844673/</a>.</p> | <p>a. Disagree. As noted in the comment, this would not represent a significant change to the text, although requires some effort to complete. Because the conclusions remain the same, no change necessary.</p> <p>b. Disagree As noted, this would represent a small change from the existing text and would have no impact on the overall conclusions.</p> |

| <b>Part 3: Responsiveness Summary</b> |             |                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| S                                     | 109         | Section 2.14.3,<br>Pages 2-60 & 2-61 | <p>Following nearly two decades of effort to determine groundwater levels under the existing EMWMF landfill, TDEC has uncertainties about the position of the water table with respect to the geologic buffer under the liner system.</p> <p>a. The EMDF ROD should commit to the development of a clear plan for monitoring the seasonal high-water table under the EMDF with more certainty. Given the plan to build the landfill in phases, it should be clearly state how the seasonal high-water table will be monitored under the knoll, where pre-construction water levels are high, as well as under lower parts of the landfill, where fill placement and waste loading may restrict groundwater discharge—a lesson learned from EMWMF.</p> <p>b. <u>Section 2.14.3, Page 2-61, 2<sup>nd</sup> &amp; 3<sup>rd</sup> bullets:</u><br/>                     Piezometer data should be collected prior to clearing the area and installing the temporary liner system. Clearing the study area and installing the temporary liner system may independently impact the seasonal high-water table by reducing evapotranspiration and direct recharge. Without controlling for both effects, it will be difficult to distinguish the liner impact from the impact of clearing the area.</p> <p>c. <u>Section 2.14.3, Page 2-61, 8<sup>th</sup> bullet:</u><br/>                     The ROD should elaborate on what is meant by “adjustment.” Provide additional explanation of how this adjustment may occur.</p> | <p>a. Disagree. As part of the CERCLA process, a Sampling and Analysis Plan will be developed post-ROD and submitted for regulatory review/approval as part of the RAWP. However, for increased transparency, the following text was added to Sect. 2.14.4 on the GWFD:</p> <p>“An EMDF-specific sampling and analysis plan will be developed post-ROD and will include the approach for monitoring the water levels post construction to demonstrate continued compliance with the RAO.”</p> <p>b. Agree in part. The existing piezometers in the GWFD area have been monitored for over 3 years and continue to be monitored. As expected, monitoring will be suspended during construction activities for the GWFD, due to both worker health and safety concerns and access limitations.</p> <p>c. Agree. While this has yet to be worked out by the FFA parties’ technical team, the text has been modified as shown below:</p> <ul style="list-style-type: none"> <li>• “Adjustment to the evaluation results. If deemed necessary due to a demonstration period that is not representative of historical rainfall (significantly wetter or drier), an adjustment may be warranted. The determination of the method used to calculate the adjustments will be</li> </ul> |

|          |             |                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | completed by an FFA triparty technical team. The adjustment process will include evaluation of rainfall amount, duration, and frequency to historical measurements, and responses measured in surrounding piezometers to historical groundwater information. The representative criteria and adjustment method will be determined by the triparty technical team.” |
| E        | 110         | Page 3-4, 2nd line on page                                 | It would be more accurate to replace “which had members from TDEC present” with “which had a TDEC representative present.”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Agree. Text revised as suggested.                                                                                                                                                                                                                                                                                                                                  |
| E        | 111         | Page 3-4, Summary of Comments and Responses, 2nd paragraph | The cited text (and text on p. 2-29) states DOE received comments from 194 individual commenters. The compilation of comments from DOE to TDEC on January 16, 2019 included comments from 195 entities (individuals or organizations), accounting for multiple comments from five entities. TDEC and DOE should compare notes to ensure all comments are considered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | See response to Comment 58, which is the same comment.                                                                                                                                                                                                                                                                                                             |
| P        | 112         | Page 3-4, Summary of Comments and Responses, 3rd paragraph | <p>In this comment, <i>comments</i> and <i>commenters</i> are italicized to emphasize the distinction because some commenters provided more than one comment.</p> <p>The cited text on p. 3-4 states “a majority of the <i>comments</i> were in favor of the preferred remedy.” Revise the text to reflect that a larger number of <i>comments</i> expressed opposition or neutrality, rather than support for the preferred alternative presented in the Proposed Plan. Based on TDEC’s evaluation, 102 <i>comments</i> supported onsite disposal, while a larger number expressed opposition (91) or neutrality (59), based on the information available at the time.</p> <p>Alternatively, revise the text for consistency with p. 2-29 which states “the majority of <i>commenters</i> were in favor of the preferred remedy.” In this case, it would be more accurate to recognize the nearly even split between the 101 <i>commenters</i> (52%) supporting the preferred remedy and the 94 <i>commenters</i> (48%) who were opposed or neutral, based on the information available at the time.</p> <p>Qualitatively, commenters who were opposed or neutral wrote longer, more substantive comments. Based on the number of words, comments from neutral entities averaged 15 times the length of comments from supporters, while comments from opposed entities were eight times longer. On average, both groups addressed six times the number of issues as commenters who supported the preferred remedy. Issues addressed included CERCLA evaluation criteria,</p> | Agree. Text was revised from “comments” to “commenters.”                                                                                                                                                                                                                                                                                                           |

|          |             |                                        | state key concerns, and other topics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                            |
| E        | 113         | Page 3-7, last paragraph, 2nd sentence | <p>a. The text mentions an example of recent disposal costs. The ROD should provide the example.</p> <p>b. For clarity, revise the sentence as follows, if this is accurate.</p> <p>One example of recent offsite disposal costs was just below the range of offsite costs presented in the Proposed Plan....</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Disagree. Without context (repeating all costs), a single number would not clarify the discussion.</p> <p>The text has been revised to reference Sect. 2.14 of the ROD, where the recent cost estimates were compared.</p>                                                              |
| O        | 114         | Page 3-8, 1st paragraph                | <p>This paragraph states the PA and CA demonstrate the long-term protectiveness of EMDF as a LLW landfill, but the D1 ROD does not provide sufficient information to support this statement. DOE completed the PA and CA under internal Directives. They are <i>not</i> CERCLA documents. The state appreciates DOE completing the PA and CA through a process independent from CERCLA and obtaining a PDAS for building a radioactive waste disposal landfill. However, the state requires a demonstration of CERCLA protectiveness and compliance with ARAR pertaining directly to the CERCLA threshold criteria.</p> <p>Revise the text to explain how CERCLA <i>protectiveness</i> has been demonstrated. Alternatively, clarify the PA demonstrates long-term <i>performance</i> of the landfill for radionuclide disposal and the CA evaluates the collective impact of potential exposure to radionuclides from EMWMF, EMDF, and all other ORR sources that might, in combination with the landfills, contribute to radiation doses to members of the public.</p> | <p>Agree. The text has been revised to note the performance is demonstrated under DOE Orders.</p>                                                                                                                                                                                          |
| N        | 115         | Page 3-69, Response #4                 | <p>Like statements throughout the D1 ROD, the response indicates decisions on mercury treatment or waste volume reduction are responsibilities of the waste generating projects and associated decision documents. The ROD, including this response, should 1) describe which CERCLA reports will document such efforts and 2) acknowledge generation of mixed CERCLA waste will be reported in conjunction with the Site Treatment Plan.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Clarification provided. Text has been added to note that D009 characteristically hazardous mercury waste is prohibited from disposal in EMDF. However, the reporting specified is the responsibility of the waste generating projects and is outside the scope and control of EMDF.</p> |
| M        | 116         | Page 3-76, Response #3                 | <p>The response states mercury contamination is a national/global concern due to atmospheric deposition of mercury from non-DOE sources. The text should be corrected to acknowledge legacy mercury operations and waste disposal on the ORR.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Agree. The following text was added to the response:</p> <p>“Mercury hazardous waste (D009 RCRA code) expected to result from the cleanup of Y-12 National Security Complex (Y-12) is prohibited from disposal in EMDF.”</p>                                                            |
| N        | 117         | Page 3-96, Response #1, 1st sentence   | <p>The sentence states “data from nearly 1000 wells in Bear Creek Valley support the conclusion that any contamination in the valley cannot reach residential areas.” Based on DOE’s publicly available database, the OREIS, there are 407</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                            |

|----------|-------------|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |                                      | <p>wells in BCV, 197 of which are active.</p> <p>a. Correct the response to reflect the actual number of wells DOE is relying on to support the statement.</p> <p>b. TDEC requests a list of the BCV wells DOE is relying on to support the statement with an indication of which wells remain available for groundwater monitoring.</p> <p>c. Wells may provide data on current and past groundwater conditions, but the response should be revised to clarify how the data from the wells “support the conclusion that any contamination in the valley cannot reach residential areas.”</p> <p>d. While TDEC is not aware of any current risks posed by off-site migration of groundwater from BCV, uncertainty remains regarding potential future risks. Has a regional groundwater flow model evaluated potential off-site transport via deep groundwater flow zones as is being done for Bethel Valley and Melton Valley?</p> | <p>a. Agree. The text was changed to indicate hundreds of wells (see response to 117c below).</p> <p>b. Clarification provided. See response to 117a.</p> <p>c. Agree. The text was revised as follows: “Existing and new data from hundreds of wells in Bear Creek Valley show groundwater flow from Pine Ridge towards Bear Creek and away from residential areas. Groundwater contamination is primarily located closer to Bear Creek in the upper part of the valley (as indicated in the 2021 Remediation Effectiveness Report). This data supports the conclusion that contamination in the valley cannot reach residential areas.”</p> <p>d. Clarification provided. This comment is not related to the referenced public comment or response; however, to provide additional information, the following response is included. DOE has conducted an offsite groundwater quality assessment to the southwest of Bear Creek Valley that has not identified DOE-derived contaminants at levels of concern. DOE has developed an ORR regional scale groundwater model that includes Bear Creek Valley. Site-specific groundwater flow and transport simulations of the many groundwater contaminant sources in Bear Creek Valley has not yet been conducted.</p> |
| N        | 118         | Page 3-96, Response #1, 2nd sentence | <p>The sentence states the law requires groundwater monitoring to identify releases around any disposal facility. TDEC agrees and notes the ROD, including this response, should commit to full compliance with those legal requirements.</p> <p>EMWWMF has operated since 2002, and TDEC continues working with DOE to ensure requirements in the ROD are met. Although the FFA Parties have discussed the issue for several years, DOE has not initiated groundwater</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Agree. This comment responses is appropriate and no changes to the ROD are required.</p> <p>Clarification provided. The scope of the EMDF ROD does not include EMWWMF and this comment is not related to EMDF or the referenced public comment. However, to</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|          |             |                                               | monitoring southwest of the landfill—a well-documented possible direction of groundwater flow through soil and bedrock fractures on the ORR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | provide additional information, the following is provided.<br><br>EMWMF has a groundwater monitoring well at the southwest corner of the disposal cells in the dominant direction of groundwater flow and several additional wells to the southwest that are monitored. Shallow groundwater and surface water are also monitored to the southwest of the disposal cells. Additional wells are planned to be constructed as agreed in the EMWMF project team meeting.                                                                                  |
| W        | 119         | Page 3-113, Response #1, 2nd to last sentence | The response states safety-basis WAC will consider nuclear criticality issues. The response could be strengthened by committing to address nuclear criticality safety through the addition of legal requirements, identified in previous comments above, into the ROD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Agree. The following text was added to the response:<br><br>“...Safety Basis limits and evaluations, including those that deal with criticality, are managed by specific DOE requirements and trained personnel throughout the lifetime of the facility.”<br><br>Also see response to Comments 74g and 74h.                                                                                                                                                                                                                                           |
| M        | 120         | Page 3-130, Response near end of page         | <p>a. The response states “Current mercury levels in Bear Creek are on the order of those in reference streams throughout the state.” While TDEC Division of Water Resources (DWR) data indicate the presence of mercury in fish throughout Tennessee, mercury levels in Bear Creek fish are two to three times higher than elsewhere in the state. For rock bass, an indicator species monitored by DOE in Bear Creek, mercury levels are about five to six times higher than those in fish from other parts of Anderson and Roane Counties.<sup>28</sup> Include the fish-tissue mercury concentrations comparisons in this response.</p> <p>b. The response also states, “DOE will control levels of mercury in landfill wastewater through treatment if necessary to meet Clean Water Act limits, prior to discharge to Bear Creek.” Remove “if necessary” from the response. The EMDF ROD should commit to the full treatment of radionuclides and hazardous/toxic chemicals in all EMDF landfill wastewater using technologies agreed by the FFA Parties.</p> <p><sup>28</sup> Thomason, C., 2019, <i>Mercury in Fish Tissue Throughout the State</i>, internal TDEC correspondence, September 18.</p> | <p>a. Disagree. The response is about Bear Creek mercury concentrations in water. The following sentence in the response describes elevated fish tissue mercury concentrations: “Even so, the fish in the creek exhibit elevated levels of mercury.” No change necessary.</p> <p>b. Agree, The response in the D2 ROD is: “DOE will control levels of mercury in landfill wastewater through treatment and per applicable or relevant and appropriate requirements and agreements reached by the FFA parties, prior to discharge to Bear Creek.”.</p> |
| M        | 121         | Page 3-147, 1st bullet, Response              | The response states, “DOE will take all practical measures to remove mercury before waste generation and send that mercury offsite to                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Clarification provided. If, after generation of the waste, it is determined to contain mercury at levels that make it                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|          |             |                            | treatment/storage/disposal facilities.” How will DOE remove mercury from debris <i>after</i> generation?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | hazardous per RCRA determinations, that waste is required to be sent for disposal offsite.                                                                                                                                                                                                                                                                                                                                           |
| O        | 122         | Page 3-151, 3rd paragraph  | The commenter asks whether EMDF would have capacity for unplanned and emergency cleanups of waste not currently projected for disposal, including unlined burial grounds needing remediation in the future. DOE’s response indicates there is a volume contingency and “there would be space for some.” The ROD should clarify whether EMDF includes adequate capacity to remediate existing disposal trenches or whether additional landfill space might be required in the future.                                                                                                                                                                                | Clarification provided. This response was during a public meeting and is part of the record; therefore, it will not be modified.<br><br>As stated in the response, there is some additional capacity planned in the 2.2M CY of EMDF. Once that is filled to capacity, alternative disposal options will be utilized for any further generated waste.                                                                                 |
| O        | 123         | Page 3-153, 1st bullet     | The commenter states a primary goal should be reducing the volume of waste. The response indicates other projects <i>can consider</i> implementing such technologies before disposing of waste in the EMDF. It also states the ROD <i>does include a commitment</i> to waste minimization.<br><br>As noted in a previous comment, the text of Section 2.12.2.4 (p. 2-46) falls short of a strong commitment to volume reduction and other forms of waste minimization. The ROD should clarify how a goal in the EMDF ROD meets the promised commitment when waste-generating projects are not within the scope of the EMDF ROD, as stated in Section 2.4 (p. 2-11). | Clarification provided. See response to Comment 14.<br><br>Response has been revised to include statement on use of the waste hierarchy for waste disposal.                                                                                                                                                                                                                                                                          |
| M        | 124         | Page 3-174, Comment 168.26 | The comment cites a statement in the Proposed Plan that “some residual levels of mercury associated with building rubble, soils and drained equipment are proposed for onsite disposal.” The response states, “plans for segregating mercury prior to and during demolition are the responsibility of the generating project and are not addressed in this disposal decision.”<br><br>a. The ROD, including this response, should commit to the development and implementation of clear, documented requirements for waste generators to assure ARARs are met.<br><br>b. Will EMDF accept waste with visible beads of mercury?                                      | a. Clarification provided. Waste generator requirements will be clarified and expanded on in the Waste Compliance Plan, as discussed in Sect. 2.12.2.3 of the D2 ROD.<br><br>b. Clarification provided. In accordance with the mercury management approach agreed to by the FFA parties and included in Sect. 2.12.2.3 of the D2 ROD, all attempts will be made to remove liquid elemental mercury from the waste prior to disposal. |

| O                                                                      | 125         | Page 3-195,<br>Response to<br>Comment 8    | <p>The commenter states, “more explanation is needed how segregation will be performed to prevent ‘clean’ waste from being disposed at the EMDF and using up available space.” The response states waste segregation and volume reduction are very high priorities for DOE on the ORR and “DOE is committed to the reduction of waste volumes going to EMDF through waste segregation and maximizing recycling.”</p> <p>As noted in a previous comment, the text of Section 2.12.2.4 (p. 2-46) falls short of a strong commitment to volume reduction and other forms of waste minimization. The ROD should clarify how a goal in the EMDF ROD meets the commitment when waste-generating projects are not within the scope of the EMDF ROD, as stated in Section 2.4 (p. 2-11).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Clarification provided. See response to Comment 14.</p> <p>Response has been revised to include statement on use of the waste hierarchy for waste disposal.</p> |
| <b>Appendix A: Applicable or Relevant and Appropriate Requirements</b> |             |                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                    |
| A                                                                      | 126         | Removal of ARARs Presented in Seven Tables | <p>Appendix A omits requirements the FFA Parties agreed upon and documented in Appendix G when their Senior Executive Committee representatives signed the RI/FS DRA dated December 7, 2017. Many of the comments related to Appendix A seek justification for removal of those ARARs and TBCs.</p> <p>Appendix G was based on several months of effort by attorneys for the FFA Parties, directed by the FFA Parties’ leadership teams. The intent was to resolve the content of ARARs tables, a part of the dispute for which resolution could be achieved without delay, unlike other parts of the dispute for which resolution was deferred—i.e., site characterization to determine groundwater levels, independent verification of the PA/CA process leading to the PDAS.</p> <p>In April 2021, DOE and contractor personnel initiated a series of meetings among the FFA Parties. DOE presented seven tables of legal requirements from the preliminary 2017 DRA that would be omitted from the D1 ROD. Although discussions among the FFA Parties led to a few ARARs being restored, many of the issues remain unresolved in the D1 ROD issued on June 17, 2021.</p> <p>The D1 ROD has text in Section 2.14, Documentation of Significant Changes, p 2-56, stating that ARARs from the Appendix G prepared as part of the DRA signed on December 7, 2017 had been removed without explanation, other than a determination these were no longer relevant and appropriate:</p> <p>The list of ARARs has changed since the RI/FS was developed (which served as the foundation for the Proposed Plan). Several ARARs that were determined to not be relevant and appropriate were removed. Removal of</p> | <p>See response to comments below, which address these Appendix A ARARs.</p>                                                                                       |

|          |             |                                                                                | <p>also be applicable to setting PRGs for the discharge of pollutants, and the FFS must be revised to include these omitted regulations. My staff will provide you shortly with a table that identifies the EPA and Tennessee CWA NPDES [National Pollution Discharge Elimination System] regulations applicable to CWA pollutants to be added to the existing ARARs/TBC tables in the Wastewater FFS.</p> <p>EPA provided the requirements in a follow-up letter dated January 19, 2021.<sup>29</sup></p> <p>DOE is required to add the additional ARARs in accordance with FFA Section XXVI:</p> <p>J. Within thirty-five (35) days of resolution of a dispute pursuant to the procedures specified in this Section, the DOE shall incorporate the resolution and final determination into the appropriate plan, schedule or procedures and proceed to implement this Agreement according to the amended plan, schedule or procedures.</p> <p>K. Resolution of a dispute pursuant to this Section of this Agreement constitutes a final resolution of any dispute arising under this Agreement. All Parties shall abide by all terms and conditions of any final resolution of dispute obtained pursuant to this Section of this Agreement. Any resolution of a dispute pursuant to this Agreement shall be incorporated into this Agreement and shall become a term and condition of this Agreement.</p> <p>This requirement is also summarized on p. 2 of the EPA Administrator’s DRD:</p> <p>As the final decision-maker for a disputed remedy at a federal facility on the NPL, the EPA has the authority to interpret ARARs, including the applicability of any flexibility provided under an ARAR.</p> <p>While TDEC recognizes some citations may be corrected to their current versions, the addition of these ARARs required by the EPA Administrator is not negotiable. The elimination of any of these ARARs is impermissible. The table must be restored to the version provided in EPA’s January 19, 2021 letter.</p> <p><sup>29</sup>Available at <a href="https://doeic.science.energy.gov/uploads/F.0600.029.0849.pdf">https://doeic.science.energy.gov/uploads/F.0600.029.0849.pdf</a>.</p> |                                                        |
| A        | 128         | Landfill Wastewater Management Requirements in 40 CFR 445 & Related Provisions | An egregious example of not following the EPA Administrator’s DRD as required by the FFA is the omission of requirements based on 40 CFR 445. In addition to removing the three specific citations of 40 CFR 445.11, 445.13, and 445.14 as ARARs, other changes were made which DOE argued flowed from the attempted elimination of the Part 445 requirements. In part, the argument                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Agree. 40 CFR 445 has been included in the ARAR table. |

|          |             |               | <p>seems to be based on a mercury waste and wastewater strategy being contemplated and negotiated by the FFA Parties for incorporation in the D2 ROD.</p> <p>Coupled with the decision not to accept any listed hazardous wastes, there is now much less significant challenge for treatment of characteristic hazardous waste not containing mercury. However, the Administrative WAC in the D1 ROD do not prohibit disposal of other kinds of characteristic hazardous waste.</p> <p>DOE carries the burden to demonstrate that its waste, mostly in the form of hazardous debris, would no longer be considered hazardous waste. It remains possible that the EMDF will still operate as a Subtitle C facility for characteristic hazardous wastes other than D009 mercury that are treated to meet LDR requirements. As a result, the EMDF would remain subject to Subpart A of 40 CFR Part 445. Even if DOE were to exclude all characteristically hazardous wastes, then it would fall into similar requirements of 40 CFR 445, Subpart B for Subtitle D RCRA landfills.</p> <p>DOE previously argued 40 CFR 445 does not apply because EMDF would be a captive landfill, as exempted by 40 CFR 445.1(f). If EMDF were a captive landfill, then the landfill wastewater would be more like process wastewater generated by the industrial process to which the landfill is "captive." The intent of the provision is not to eliminate a requirement for landfill wastewater treatment but to align the treatment standards to the CWA Effluent Limitations Guidelines (ELG) for the industrial process.</p> <p>It is a separate issue that DOE's landfill wastewater may not contain all or even most of the constituents identified for treatment. DOE argues the burden for monitoring constituents the wastewater would not contain. In rejecting the substantive treatment requirements in 40 CFR 445, DOE also rejected the requirements provided by 40 CFR 122.44(a)(2)(i)-(iv), which would alleviate any burden of continued monitoring for any of the pollutants covered in 445.13, provided DOE can demonstrate they are not present in its wastes.</p> <p>While most of the EPA Administrator's DRD deals with radionuclides and use of state water quality standards as relevant and appropriate for addressing discharges of landfill wastewater contaminated with radionuclides, 40 CFR 445 was included in the ARARs table accompanying the DRD without discussion as applicable requirements. This regulatory part contains CWA ELGs which establish technology-based treatment standards for constituents in leachate from</p> |          |

Terms used in the definitions provided in 40 CFR 445.2 must be used to interpret the applicable requirements; the term “landfill wastewater” includes contaminated storm water, a defined term also known as “contact water,” and leachate among other types of wastewater. Based on historical data from EMWMF, levels of some contaminants in “contact water” may exceed level measured in leachate. Landfill wastewater is to be managed separately from uncontaminated storm water, ensuring treatment is applied to landfill wastewater without dilution by uncontaminated storm water, as has been the practice with EMWMF. |                                                                                                                                                                                     |                   |              |              |          |                          |  |  |  |                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                    |                       |

| A        | 130         |               | <p><b>Removed TBCs include DOE Orders</b></p> <p>While DOE correctly argues inclusion of TBC requirements is not mandatory, the burden is on DOE to explain the omission of TBCs the FFA Parties agreed to include in signing the 2017 DRA. The D1 ROD does not explain why these requirements would no longer be useful for the selected remedy. The use of TBCs is consistent with and complements statutory requirements to protect human health and the environment and to comply with ARARs.<sup>30</sup> In 2017, the FFA Parties did not agree on the enforceability of TBCs based on DOE Order 435.1-1 if included in the ROD, but the FFA dispute did not address the contribution of the TBCs to remedy protectiveness.</p> <p>As noted in TDEC comments on the third draft (D3) and other drafts of the RI/FS, DOE Orders represent DOE's regulatory responsibilities under the AEA, as well as its obligation to maintain EMDF in perpetuity. Consequently, the ROD should list DOE Orders as TBC requirements because they provide a basis for more stringent requirements than the TDEC rules. The expectation is the more restrictive requirement will apply, as is typical of the CERCLA process.</p> <p>During Appendix G revision in the fall of 2017, DOE proposed to identify the requirements based on DOE 435.1-1 with an asterisk to indicate the TBCs would not be enforceable by EPA. As part of a CERCLA ROD, DOE Orders listed as TBC would need to be independently enforceable through CERCLA. As such, the TBCs would lose their nature as self-regulated requirements of the Atomic Energy Act (AEA) and be subject to external enforcement.</p> <p>EPA should recognize DOE's consistent interpretation and application of DOE Order 435.1 requirements as a consideration in any potential enforcement of requirements placed in the ROD. Moreover, under the FFA, DOE is amply protected from EPA making an arbitrary interpretation. DOE has exaggerated the risk to its AEA authority that might be posed by listing DOE Order requirements as TBCs and has a long history of including DOE Order requirements as TBCs without raising this issue. TDEC would also agree to examine how DOE has interpreted and applied DOE Order requirements in considering any action it might take to enforce the ROD.</p> <p>Many DOE Order requirements relate to the matters of characterization, temporary storage, and treatment of LLW. Table A-3 in the D1 ROD includes ARARs derived from NRC regulations and compatible TDEC DRH rules that</p> | See response to Comment 129. |

|----------|-------------|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|          |             |                                             | <p>are identified as “relevant and appropriate.” However, it is not clear the DOE Order requirements are matched by corresponding ARARs performing the same functions.</p> <p>Omission of any TBCs the FFA Parties agreed to in 2017 should be selective and justified. The ROD should show why individual TBCs are unnecessary— e.g., they relate to aspects of LLW management that will not occur at EMDF or they duplicate ARARs in the ROD. As an example, three of the requirements, DOE M 435.1-1(IV)(J)(2), DOE M 435.1-1(I)(1)(E)(11), and DOE M 435.1-1(IV)(L)(2), indicated by pound/hashtag symbols (#) in Table 1 above, appear related only to offsite disposal and may not be within the scope of this ROD. The explanation for removing these requirements might be that offsite shipment is covered by RODs for actions that will generate the LLW, but DOE should confirm these requirements are covered in such CERCLA decision documents or there is an intent to add these requirements.</p> <p>At the bottom of the original Table 1, there were several omitted TBCs for TDEC general ARAPs. It is appropriate to remove these requirements because they are superseded by general permits issued later which are cited in Appendix A. This example highlights the flaw in the wholesale removal of other TBCs, because these requirements are not defined as ARARs, but they serve important functions not provided by other requirements for protectiveness of the selected remedy.</p> <p><sup>30</sup> 40 CFR 300.430(g)(3) and the 1990 NCP preamble, 55 FR 8666 at 8745.</p> |          |
| A        | 131         | Table 2 Removed Administrative Requirements | <p>During meetings of the FFA Parties, DOE cited and quoted a long excerpt from the <i>CERCLA Compliance with Other Laws Manuals: Part I</i> (EPA-540/G-89/006)<sup>31</sup> to justify removing a set of requirements identified in Table 2 below as administrative. While the definitions have been stated, no individual justification is provided to explain why the requirements serve no substantive purpose, rather than merely concluding that each requirement should be removed. Each requirement should be restored, or specific justification should be provided for its removal. Some of the requirements were restored during the FFA Party discussions mentioned above. TDEC added a comment column to the table below to indicate which requirements were kept and cited the relevant table and page in the D1 ROD.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |          |

Their removal was based on the point these requirements were not associated with the selected remedy. TDEC has offered comments and continues to believe volume reduction would be beneficial to preserve landfill capacity. However, TDEC also acknowledges these requirements were not associated with the larger onsite disposal sites evaluated in the RI/FS that TDEC never officially approved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Comment noted, no response required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |             |              |              |          |  |                        |  |  |  |  |
| A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 133          | Table 4 Removed RCRA Tank System Requirements | <p>Has DOE determined EMDF will not generate hazardous landfill waste water in accordance with 40 CFR 262.11(a)-(b) and Tenn. Comp. R. &amp; Regs. § 0400-12-01-.03(1)(b)? As mentioned in an earlier comment, the possibility remains that the EMDF will accept hazardous wastes. While WAC would prohibit the disposal of listed wastes, negating applicability of the RCRA “derived from” rule or the “pass-through” principle [see 40 CFR 261.3(a)(2)(iii)-(iv) and 261.3(c)(2)(i)], TDEC asks for a quantitative demonstration, or at least a clear explanation supporting DOE’s assertion, that no characteristically hazardous landfill wastewater will be generated.</p> <p>Given the anticipated need to treat high concentrations of mercury and other pollutants, including radionuclides, in landfill wastewater, storage tanks should be designed with secondary, lined containment to protect against spillage. These requirements are commonly applied to leachate storage systems at permitted solid waste “Subtitle D” disposal facilities, even though they are not required to comply with provisions for double-walled tanks, double-walled piping, and other requirements for facilities intended to hold hazardous wastes. TDEC highlights these requirements in the table below.</p> | <p>Clarification provided. Based on the operational experience at EMWMF and the anticipated wastes to be sent to EMDF, DOE does not anticipate any characteristically hazardous landfill wastewater will be generated. Text was added to the ROD as follows: “The FFS Appendix F provides the determination that no characteristically hazardous wastewater is anticipated to be generated.”</p> <p>RCRA-listed waste is prohibited from disposal at EMDF. In addition, tanks and ancillary piping associated with the EMDF wastewater treatment system are exempt from the RCRA Tank System requirements under the RCRA onsite WWTU exemption. The use of containment for tanks and piping will be considered in final design.</p> <p>The FFA parties have agreed that these ARARs will not added.</p> |             |              |              |          |  |                        |  |  |  |  |

|          |             |                                                | hazardous waste or not. However, TDEC reiterates the need for lined secondary containment, as stated above.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| A        | 134         | RCRA Wastewater Management System Requirements | <p>The ROD should clarify how landfill wastewater will be managed. In addition to the information requested in Comment 68a, the ROD should explain the following.</p> <p>a. Will landfill wastewater be managed in ponds, tanks, or both?</p> <p>At EMWMF, “contact water” is stored in ponds and open tanks, while leachate is stored in a separate set of tanks. Figure 2.5 (p. 2-36) shows six “Leachate/Contact Water Storage” tanks, and text in Section 2.12.2.1 (p. 2-38) describes “the landfill wastewater storage system,” with no discussion of ponds or tanks.</p> <p>If ponds or basins are used, they would be regulated as surface impoundments under RCRA. If only tanks are used, the surface impoundment regulations would not be ARARs for the design.</p> <p>b. Explain how DOE will avoid operating landfill cells as wastewater impoundments.</p> <p>c. Explain how DOE will ensure landfill wastewater on the liner does not exceed 30 centimeters (cm), as required by 40 CFR 264.301(c)(2) and Tenn. Comp. R. &amp; Regs. § 0400-12-01-.06(14) (b)(1)(ii).</p> | <p>Clarification provided.</p> <p>a. Landfill wastewater at EMDF will be stored and managed in tanks.</p> <p>b. The EMDF would not be a surface impoundment by definition since it is not designed to impound water. Accumulated liquid in a cell that passes through the leachate collection system would be managed and stored in the Leachate/Contact Water Storage tanks. Contact water that collects in the cell also would be managed and transferred to the Leachate/Contact Water Storage tanks.</p> <p>c. The landfill design will be provided in a post-ROD Remedial Design Report for regulator review and approval. However, the disposal cells leachate collection systems are planned to be graded to drain leachate to a sump in each cell. The accumulated leachate in the sumps will then be pumped to the Leachate/Contact Water Storage tanks before the water level exceeds 30 cm. This design is similar to most of the lined landfills permitted by the State of Tennessee.</p> |
| A        | 135         | Table 5 Removed Asbestos Closure Requirements  | While certain aspects of the RCRA Subtitle C regulatory scheme provide more stringent requirements such as depth of final cover, it is not clear whether all the National Emission Standards for Hazardous Air Pollutants (NESHAP)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Agree. These NESHAP requirements were restored to the ROD ARARs Table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|----------|-------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|          |             |               | <p>requirements have counterparts in the RCRA Subtitle C regulations. Specificity can constitute stringency, and ARARs are parsed into specific requirements; generalizations are not useful. Also, EPA has indicated that redundancy in a ROD provides flexibility in the RD phase, but there is an opportunity to eliminate ARARs related to features not needed for design. For example, a contentious issue among the FFA Parties is whether to include RCRA Subtitle C tank and surface impoundment requirements as ARARs. DOE asserts such prescriptive storage tank specifications should not be required for EMDF landfill wastewater because of DOE's decision to prohibit listed hazardous waste and characteristic mercury D009 wastes. Leaving aside the issue that EMDF could accept other characteristic hazardous wastes, EPA has stated there is no obligation to comply with ARARs for which there are no applicable or relevant and appropriate features in the design.</p> <p>For example, EMWMF uses tanks and surface impoundments for managing landfill wastewater—i.e., leachate and contaminated storm water, also known as “contact water.” Preliminary drawings for EMDF indicate only tanks are being considered. In the event the decision is made to use only tanks, then the requirements for surface impoundments will not be ARAR. The design must meet ARARs, but the ARARs do not dictate the design. Based on extensive experience, an EPA attorney emphasized that ARARs can be eliminated during design but adding ARARs during that phase can cause delay because of the requirement to prepare, review, and approve an Explanation of Significant Differences. One example cited involved a project where the responsible party emphatically refused to consider staging remediation waste in a pile and then decided to use a staging pile, resulting in delays because the corresponding ARARs were not included in the ROD.</p> <p>Similarly, the analysis of stringency for NESHAP requirements and RCRA Subtitle C requirements can be made as part of the RD/RA. The RD/RA process uses documents like the Remedial Design Work Plan (RDWP) which provides opportunities to determine the necessity of various ARARs and compare and evaluate specificity and stringency of similar requirements. ROD language can be agreed that will recognize the ability to remove ARARs not needed for final design.</p> |          |

Rather than engaging in lengthy analysis at this juncture, the approach described in the previous comment can be taken to allow DOE to select the more stringent ARARs when needed for design. One example that should be convincing is reliance on the geologic buffer requirements from Tenn. Comp. R. &amp; Regs. § 0400-20-11-.04(4)(a) with Subtitle C liner requirements as the basis for ARAR waivers. The solid waste scheme overall requires less stringent liner and final cover systems, but the geologic buffer requirements is a very useful specific requirement. The same utility could apply to one of the solid waste requirements DOE seeks to eliminate after identifying them as ARARs earlier in the CERCLA process.</p> <p style="text-align: center;"><b>Table 6 Removed Solid Waste Requirements</b><br/> <b>RCRA Hazardous Waste Requirements are Applicable and More Stringent</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="background-color: #d9e1f2;">Application</th> <th style="background-color: #d9e1f2;">Requirements</th> <th style="background-color: #d9e1f2;">Prerequisite</th> <th style="background-color: #d9e1f2;">Citation</th> </tr> </thead> <tbody> <tr> <td colspan="4" style="text-align: center; background-color: #d9e1f2;"><i>Action-specific</i></td> </tr> <tr> <td style="background-color: #d9e1f2;">Facility design, construction</td> <td style="background-color: #d9e1f2;">           Underlying the liners shall be a geologic buffer which shall have:           <ul style="list-style-type: none"> <li>(i) A maximum hydraulic conductivity of <math>1.0 \times 10^{-5}</math> cm/s and measures at least ten (10) feet from the bottom of the liner to the seasonal high-water table of the uppermost unconfined aquifer or top of the formation of a confined aquifer, or</li> <li>(ii) Have a maximum hydraulic conductivity of <math>1.0 \times 10^{-6}</math> cm/s and measure not less than five (5) feet from the bottom of liner to the seasonal high-water table of the uppermost unconfined aquifer or the top</li> </ul> </td> <td style="background-color: #d9e1f2;">Design and construction of a solid waste landfill—<b>relevant and appropriate</b></td> <td style="background-color: #d9e1f2;">TDEC 0400-11-01-.04(4)(a)(2)</td> </tr> </tbody> </table> | Application | Requirements | Prerequisite | Citation | <i>Action-specific</i> |  |  |  | Facility design, construction | Underlying the liners shall be a geologic buffer which shall have: <ul style="list-style-type: none"> <li>(i) A maximum hydraulic conductivity of <math>1.0 \times 10^{-5}</math> cm/s and measures at least ten (10) feet from the bottom of the liner to the seasonal high-water table of the uppermost unconfined aquifer or top of the formation of a confined aquifer, or</li> <li>(ii) Have a maximum hydraulic conductivity of <math>1.0 \times 10^{-6}</math> cm/s and measure not less than five (5) feet from the bottom of liner to the seasonal high-water table of the uppermost unconfined aquifer or the top</li> </ul> | Design and construction of a solid waste landfill— <b>relevant and appropriate</b> | TDEC 0400-11-01-.04(4)(a)(2) | <p>Clarification provided. This requirement is already in the D1 ROD ARARs Table.</p> |

Fencing, diking and/or other practices shall be provided as necessary to confine solid wastes subject to dispersal. All litter must be collected for disposal in a timely manner.</p>                                                                                                                                                                                                                                                   | <p>Operation of a Subtitle D solid waste landfill— <b>relevant and appropriate</b></p> <p>TDEC 0400-11-01-.04(2)(d)</p>  |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |             | Operation of a Subtitle D solid waste landfill | <p>There must be maintained on-site operating equipment capable of spreading and properly compacting the volume of solid wastes received, and capable of handling the earthwork required. Back-up equipment must be available within 24 hours of primary equipment</p>                                                                                                                                                                                                                                                | <p>Operation of a Subtitle D solid waste landfill—<b>relevant and appropriate</b></p> <p>TDEC 0400-11-01-.04(2)(g)</p>   |
| <p>Agree. This requirement was restored to the ARARs in the ROD.</p> <p>Disagree. This requirement is designed for the specific wastes received by municipal waste landfills. EMDF will be receiving industrial wastes which, unlike municipal wastes, do not include litter-type waste subject to dispersal by wind.</p> <p>Disagree. This bullet appears related to the last bullet where such machinery would be essential to the operation of a solid waste landfill where daily and intermediate cover is required under the solid waste regulations at municipal waste facilities.</p> <p>Disagree. This bullet appears related to daily and intermediate cover, which is required for a solid waste landfill. It is anticipated</p> |             |                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                          |

| Wastewater transferred by truck or pipeline to on-site on-ORR CWA-authorized WWTU | A user may not introduce into a wastewater facility any pollutant(s) which causes pass through or interference, and wastewater must meet the pretreatment standards and prohibitions [waste acceptance criteria and limits] set by the wastewater facility prior to transfer.<br><span style="color: red;"><b>THIS ARAR REMOVED SINCE IT APPLIES TO WASTEWATER TRANSFER TO PWTC OR OTHER ONSITE TREATMENT FACILITY, NOT PART OF REMEDY</b></span> | Transfer of contaminated wastewater to a CWA-authorized wastewater facility for treatment— <b>applicable</b> | TDEC 0400-40-14-.05(1) – (2) and (4)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |              |              |          |                        |  |  |  |                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                              |                                      |  |
| A                                                                                 | 138                                                                                                                                                                                                                                                                                                                                                                                                                                               | Table A.1, p. 5, last row                                                                                    | <p>Tennessee’s antidegradation rule is correctly listed as an ARAR. The table should note the remedy does not involve water withdrawal, only discharge. It should also note Tennessee determines whether a parameter is “unavailable” by referencing its CWA 303(d) list, available online at the following addresses:</p> <p style="padding-left: 40px;"><a href="https://www.tn.gov/environment/program-areas/wr-water-resources/water-quality/water-quality-reports---publications.html">https://www.tn.gov/environment/program-areas/wr-water-resources/water-quality/water-quality-reports---publications.html</a></p> <p style="padding-left: 40px;"><a href="https://www.tn.gov/content/dam/tn/environment/water/planning-and-standards/wr_wq_303d-2020-final.xlsx">https://www.tn.gov/content/dam/tn/environment/water/planning-and-standards/wr_wq_303d-2020-final.xlsx</a></p> <p>Based on the most recent (2020) report, Bear Creek is not meeting its designated recreational use for mercury, PCBs, nitrites/nitrates, and cadmium. Mercury (in the form of methylmercury) and PCBs bioaccumulate in fish, and the rule allows “no additional loading.” For nitrites/nitrates and cadmium, the requirement is to allow no measurable degradation. The table should differentiate these two requirements, and it should note the current status of Bear Creek the 303(d) list. The table should also note this rule subparagraph will no longer be an ARAR if</p>                                                                                                                                               | <p>Agree. The table was revised to note:</p> <ul style="list-style-type: none"> <li>• The remedy does not involve water withdrawal</li> <li>• An unavailable parameter is determined by Tennessee’s CWA 303(d) list</li> <li>• Differentiate between “no additional loading” and “no measurable degradation” requirements</li> <li>• The current status of Bear Creek</li> <li>• Will no longer be ARAR if Bear Creek attains its designated use prior to EMDF discharging wastewater</li> </ul> |              |              |          |                        |  |  |  |                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                              |                                      |  |

|          |             |               | <p>conditions improve, such that Bear Creek attains its designated use before EMDF begins discharging wastewater.</p> <p>Based on the separate agreement related to the discharge of mercury in landfill wastewater, mentioned above, the ROD should include ARARs based on substantive portions of the following regulatory language and citations:</p> <p>40 CFR 122.4:</p> <p>(i) To a new source or a new discharger, if the discharge from its construction or operation will cause or contribute to the violation of water quality standards. The owner or operator of a new source or new discharger proposing to discharge into a water segment which does not meet applicable water quality standards or is not expected to meet those standards even after the application of the effluent limitations required by sections 301(b)(1)(A) and 301(b)(1)(B) of CWA, and for which the State or interstate agency has performed a pollutants load allocation for the pollutant to be discharged, must demonstrate, before the close of the public comment period, that:</p> <p>(1) There are sufficient remaining pollutant load allocations to allow for the discharge; and</p> <p>(2) The existing dischargers into that segment are subject to compliance schedules designed to bring the segment into compliance with applicable water quality standards. The Director may waive the submission of information by the new source or new discharger required by paragraph (i) of this section if the Director determines that the Director already has adequate information to evaluate the request. An explanation of the development of limitations to meet the criteria of this paragraph (i)(2) is to be included in the fact sheet to the permit under § 124.56(b)(1) of this chapter.</p> <p>The state counterpart is found at Tenn. Comp. R. &amp; Regs. § 0400-40-05-.04(1)(g) but without the language limiting the use of an offset as a basis to find a new discharge does not “cause or contribute” to a violation. Primarily, state rule citations are used, and there is generally no substantive difference. Under 42 USC §9621(2)(d)(2)(ii) in the strictest sense, a state regulation is only ARAR if it is more stringent than its federal counterpart or it has no federal counterpart. For this context any discharge must be consistent with the terms of the Total Maximum Daily Load (TMDL)-equivalent approach developed under CERCLA.</p> <p>While the obligation to establish a TMDL is a duty of the state, one of the</p> | <p>Agree. Will add 40 <i>CFR</i> 122.4(i) as ARAR as agreed to in the FFA parties Mercury Management Approach agreement.</p> |

|----------|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |             |               | <p>acceptable reasons why a state may avoid establishing a TMDL is because the water quality is being addressed under “alternate authority,” which is CERCLA in this situation. Hence, through CERCLA the functional equivalent of a TMDL can be put in place, and the compliance schedule can be established, as mentioned in 40 CFR 122.4(i).</p> <p>40 CFR§ 130.7:</p> <p>(c)For pollutants other than heat, TMDLs shall be established at levels necessary to attain and maintain the applicable narrative and numerical WQS with seasonal variations and a margin of safety which takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality. Determinations of TMDLs shall take into account critical conditions for stream flow, loading, and water quality parameters.</p> <p>(i) TMDLs may be established using a pollutant-by-pollutant or biomonitoring approach. In many cases both techniques may be needed. Site-specific information should be used wherever possible.</p> <p>(ii) TMDLs shall be established for all pollutants preventing or expected to prevent attainment of water quality standards as identified pursuant to paragraph (b)(1) of this section. Calculations to establish TMDLs shall be subject to public review as defined in the State CPP.</p> <p>Under Tenn. Comp. R. &amp; Regs. § 0400-40-05, no direct counterpart exists for 40 CFR 122.44(d)(1)(vi), which states:</p> <p>(vii) When developing water quality-based effluent limits under this paragraph the permitting authority shall ensure that:</p> <p>(A) The level of water quality to be achieved by limits on point sources established under this paragraph is derived from, and complies with all applicable water quality standards; and</p> <p>(B) Effluent limits developed to protect a narrative water quality criterion, a numeric water quality criterion, or both, are consistent with the assumptions and requirements of any available wasteload allocation for the discharge prepared by the State and approved by EPA pursuant to 40 CFR 130.7.</p> <p>Consequently, an ARAR based on this regulatory subsection should be added to the ROD in case the equivalent of a TMDL is developed to restore the Bear</p> | <p>40 <i>CFR</i> 122.44(d)(1)(vi)(A) is already in the EMDF ROD ARARs. Disagree as to adding 40 CFR 122.44(d)(1)(vi)(B) as effluent limits will be established according to the ARARs in the ROD. Once the ROD is signed the ARARs are “frozen” under CERCLA and the NCP (40 <i>CFR</i> 300.430(f)(1)(ii)(B)). Any future TMDL or equivalent TMDL developed by TDEC would not become ARAR unless a FYR found the existing effluent limitation were no longer protective. Showing compliance with an ARAR based on a TMDL that currently does not exist would not be possible.</p> |

|          |             |               | <p>Creek watershed for methylmercury or PCBs.</p> <p>While definitions are not ARARs, the terms used in the TMDL regulations are defined at 40 CFR 130.2:</p> <p>(e) Load or loading. An amount of matter or thermal energy that is introduced into a receiving water; to introduce matter or thermal energy into a receiving water. Loading may be either man-caused (pollutant loading) or natural (natural background loading).</p> <p>(f) Loading capacity. The greatest amount of loading that a water can receive without violating water quality standards.</p> <p>(g) Load allocation (LA). The portion of a receiving water's loading capacity that is attributed either to one of its existing or future nonpoint sources of pollution or to natural background sources. Load allocations are best estimates of the loading, which may range from reasonably accurate estimates to gross allotments, depending on the availability of data and appropriate techniques for predicting the loading. Wherever possible, natural and nonpoint source loads should be distinguished.</p> <p>(h) Wasteload allocation (WLA). The portion of a receiving water's loading capacity that is allocated to one of its existing or future point sources of pollution. WLAs constitute a type of water quality-based effluent limitation.</p> <p>(i) Total maximum daily load (TMDL). The sum of the individual WLAs for point sources and LAs for nonpoint sources and natural background. If a receiving water has only one point source discharger, the TMDL is the sum of that point source WLA plus the LAs for any nonpoint sources of pollution and natural background sources, tributaries, or adjacent segments. TMDLs can be expressed in terms of either mass per time, toxicity, or other appropriate measure. If Best Management Practices (BMPs) or other nonpoint source pollution controls make more stringent load allocations practicable, then wasteload allocations can be made less stringent. Thus, the TMDL process provides for nonpoint source control tradeoffs.</p> <p>(j) Water quality limited segment. Any segment where it is known that water quality does not meet applicable water quality standards, and/or is not expected to meet applicable water quality standards, even after the application of the technology-based effluent limitations required by sections 301(b) and 306 of the Act.</p> | <p>Disagree. The EPA guidance cited is for the development of TMDLs. The FFA parties have specifically agreed to develop an equivalent of a TMDL under CERCLA authority. Guidance related to developing TMDLs and TMDL terminology would not provide guidance to a process not intended to develop a TMDL, but an equivalent under CERCLA authority specific for Bear Creek.</p> |

|          |             |               | <p>Also, the following EPA guidance should be listed as TBCs. These links provide information about using offsets as allowed by 40 CFR 122.4(i) based on non-point sources planned as part of the TMDL. Specifically, note the recognition in 40 CFR 130.2(i) of the ability to use nonpoint reductions to allow a higher Waste Load Allocation (WLA) to a point source like the EMDF.</p> <p><a href="https://www.epa.gov/npdes/water-quality-trading-basics-and-policy-resources">https://www.epa.gov/npdes/water-quality-trading-basics-and-policy-resources</a></p> <p><a href="https://www.epa.gov/sites/default/files/2015-10/documents/2006_08_08_tmdl_tmdl_clarification_letter.pdf">https://www.epa.gov/sites/default/files/2015-10/documents/2006_08_08_tmdl_tmdl_clarification_letter.pdf</a></p> <p>The third type of TMDL, described in the Great Lakes Initiative, is different from the two preceding types. While not a "phased TMDL," it is a TMDL that anticipates implementation in several distinct stages. It is also different from the adaptive implementation scenario because it anticipates the load and wasteload allocations will not require any significant adjustments. Instead, implementation actions will be staged over a period of time. For example, EPA has approved mercury TMDLs where the wasteload allocation to point sources, which would be implemented within five years through the NPDES process, was predicated on long-term reductions in atmospheric mercury deposition. TDEC believes the appropriate terminology for such a TMDL, if a label needs to be applied, would be "staged implementation."</p> <p>The second link provided above leads to information that discusses EPA's 1991 guidance regarding the use of "phased TMDLs" in two situations.<sup>32</sup> In the first situation, the guidance addresses waters impaired by both point and nonpoint sources, where wasteload allocations to point sources are predicated on nonpoint source loading reductions—i.e., where point sources receive higher wasteload allocations because the TMDL assumes nonpoint sources will generate reduced loads. In such cases, the guidance recommends that some additional provision in the TMDL, such as a schedule and description of the implementation mechanisms for nonpoint source control measures, be included to provide reasonable assurance that the nonpoint source measures will achieve the expected load reductions.</p> <p><sup>32</sup> EPA, 1991, <i>Guidance for Water-Quality-based Decisions: The TMDL Process</i>, EPA 440/4-91-001, April; available at <a href="https://www.epa.gov/sites/default/files/2018-10/documents/guidance-water-tmdl-process.pdf">https://www.epa.gov/sites/default/files/2018-10/documents/guidance-water-tmdl-process.pdf</a>.</p> |          |

| A        | 139         | EPA Comments  | <p>TDEC appreciates the opportunity to review an earlier set of EPA comments on ARARs and general concurs with those comments, unless the issue has been specifically addressed earlier in these comments. TDEC does not understand the EPA comment that hazardous waste tank requirements are applicable, unless the WWTU exemption is eliminated. However, TDEC would join in most of the EPA comments and specifically applauds comments calling for restoration of ARARs required by Administrator Wheeler’s DRD resolving the landfill wastewater FFS dispute and the supplemental ARARs table provided in a follow-up letter dated January 19, 2021.<sup>29</sup> Also, TDEC was specifically asked to check with the DWR about the applicability of a set of requirements EPA provided from 40 CFR 230. TDEC confirms these requirements can be applied consistent with the practices used by the DWR in its water pollution control program and supports the addition of these ARARs.</p> <p><sup>29</sup> Available at <a href="https://doeic.science.energy.gov/uploads/F.0600.029.0849.pdf">https://doeic.science.energy.gov/uploads/F.0600.029.0849.pdf</a>.</p> | <p>Comment noted. See prior responses and related responses to EPA comments regarding RCRA tank requirements, ARARs identified by the EPA Administrator’s decision, and EPA wetland mitigation regulations in 40 <i>CFR</i> 230.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|          |             |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | EMDF D1 ROD ARARs. Showing compliance with an ARAR is not a substantive requirement and thus does not meet the definition of an ARAR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| A        | 142         |               | <p><b>Drinking Water Protection</b></p> <p>Appendix A omits Safe Drinking Water Act (SDWA) standards. Preliminary EMDF ARAR text documented in DRA Appendix G states this remedial action is not being conducted in or on surface or groundwater; therefore, the MCLs are not ARARs. Yet, the basis of the inventory-limit analytic WAC proposed in the D1 ROD is use of groundwater from a nearby well. If the PA analytic WAC applied in the ROD to satisfy the CERCLA protectiveness criterion are based on use of groundwater as tap water, how could MCLs not be ARARs?</p> <p>As explained in the D1 ROD, an RAO is necessary to ensure 15 ft of separation between EMDF waste and the seasonal high-water table because of shallow natural groundwater levels documented in TM-1 and TM-2. The D1 ROD also describes plans to build the landfill immediately adjacent to several streams.</p> <p>SDWA standards (e.g., MCLs) must be ARARs to ensure the remedy protects water resources—one of the most important substantive requirements of any landfill permit. Arguably, most of the state’s seven key concerns documented in the Proposed Plan relate to ensuring remedy protectiveness for exposure to groundwater. The fourth (D4) and fifth (D5) drafts of the RI/FS include an RAO to prevent adverse impacts to water through meeting SDWA MCLs in waters that are current or potential sources of drinking water.</p> | <p>Clarification provided. This remedial action (building and operating the EMDF) is not addressing the cleanup of groundwater. Chemical-specific ARARs, such as MCLs, normally set levels for cleanup and are used for PRGs. The groundwater surrounding the EMDF facility boundary will be addressed by a future CERCLA groundwater remedial action. During the operation and closure of EMDF, the remedial action is not trying to attain any chemical-specific ARAR in groundwater. Any releases from EMDF detected by groundwater monitoring that would necessitate a response action in the future would be addressed by a future decision document (i.e., amendment to the ROD) where the MCLs would then be evaluated as ARAR.</p> |
| A        | 143         |               | <p><b>Corrective Action Practicability</b></p> <p>a. Tenn. Comp. R. &amp; Regs. § 0400-12-02-.03(2)(e)(1)(i)(III) is cited on p. A-19, but the D1 ROD needs to provide information documenting the required demonstration of the technical practicability of a corrective action program at the site.</p> <p>b. Consider including other parts of Tenn. Comp. R. &amp; Regs. § 0400-12-02-.03 as ARARs because they address floodplains, wetlands, seismic considerations, areas of complex hydrogeology, corrective action buffer zones, and surface waters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>a. Agree. Information has been added in regard to compliance with this ARAR.</p> <p>b. Disagree. Location requirements in the Commercial Hazardous Waste Management Facility regulations appear designed to site a landfill in a pristine location and do not contemplate issues associated with an existing CERCLA site. Existing ARARs listed in the D1 EMDF ROD ARARs already address these location factors.</p>                                                                                                                                                                                                                                                                                                                    |

It is not a substantive requirement. The substantive requirements for unavailable parameters in subparagraphs (2)(a), (2)(b), and (2)(c), as noted, have been included as ARAR.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| A        | 144         |               | <p><b>Groundwater Classification and Criteria</b><br/>         Consider including portions of Tenn. Comp. R. &amp; Regs. §§ 0400-40-03-.07 and 0400-40-03-.08 as ARARs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Clarification provided. This remedial action (building and operating EMDF) is not addressing the cleanup of groundwater. Chemical-specific ARARs, such as Tennessee Groundwater Criteria, normally set levels for cleanup and are used for PRGs. The groundwater surrounding the EMDF facility boundary will be addressed by a future CERCLA groundwater remedial action. During the operation and closure of EMDF, the remedial action is not trying to attain any chemical-specific ARAR in groundwater. Any releases from EMDF detected by groundwater monitoring that would necessitate a response action in the future would be addressed by a future decision document (i.e., amendment to the ROD) where the Tennessee Groundwater Criteria would then be evaluated as ARAR.</p> |
| A        | 145         |               | <p><b>Post-closure Stability</b><br/>         Based on the D1 ROD, EMDF WAC relies in part on NRC Class C limits. Therefore, the ROD should include as ARARs key requirements from NRC-compatible rule Tenn. Comp. R. &amp; Regs. § 0400-20-11-.17, Technical Requirements for Land Disposal Facilities, on which disposal of such wastes is premised. Specifically, disposal of Class C waste is premised on compliance with 10 CFR 61.55(a)(2)(iii) and 10 CFR 61.56, which highlights the need to include the TDEC-compatible rules as ARARs in the ROD. Those rules are Tenn. Comp. R. &amp; Regs. §§ 0400-20-11-.17(6)(b)(3) and 0400-20-11-.17(7), respectively.<br/>         ROD (Appendix A &amp; Table 2.4) should list all waste characteristics requirements in Tenn. Comp. R. &amp; Regs. § 0400-20-11-.17(7) as ARARs and cite them verbatim. The first six paragraphs of Tenn. Comp. R. &amp; Regs. § 0400-20-11-.17(7) are included, but the seventh paragraph (gas pressures and activities) and eighth paragraph (hazardous, biological, pathogenic or infectious</p> | <p>Disagree. § 0400-20-11-.17(6)(b)(3) does not meet the ARAR definition. It does not provide substantive requirements but points to other substantive provisions, some which have been included as ARAR and others not.<br/>         The substantive requirements not included from TDEC 0400-20-11-.17(7) (subparagraphs 7 and 8) include wastes that will not be accepted at EMDF and are precluded by the WAC; thus, these requirements would not be relevant and appropriate to the EMDF operations.</p>                                                                                                                                                                                                                                                                              |
