DOE will **treat** all contaminated wastewater and leachate from EMDF prior to discharge into Bear Creek. The treatment will include, **at a minimum**, chemical flocculation/precipitation and sediment removal. DOE will conduct **secondary treatment** as necessary to ensure compliance with all **regulatory limits** and full protection of human health and environment. **Protective levels** have been set for radionuclides that may potentially be in the landfill wastewater. **Radionuclide levels** will be directly measured in contaminated wastewater and leachate, fish, and surface waters. These **measured values** will be compared to **regulatory limits** and newly developed **fish tissue and surface water values** (preliminary remediation goals [PRG]) that ensure **protection of public health**. (For more information on **these values**, and how they are calculated, see <http://ucor.com/wp-content/uploads/2022/05/Rad-PRG-Explanation.pdf>.)<sup>36</sup>

This paragraph is confusing at best and misleading at worst. To start, DOE fails to provide meaningful insight into its proposed treatment standards. The Department states that it will “treat” wastewater and leachate from the EMDF, lays out treatment methods which will be performed “at a minimum,” and then states that “secondary treatment” may also occur. Yet the public is left in the dark about the actual contours of this treatment regime. Is DOE considering other basic treatments which will apply to all contaminated wastewater and leachate? Do these include control technologies as preferred by CERCLA, prioritized in the CWA, and which are ARARs for hazardous pollutants like PCBs and mercury?<sup>37</sup> When will secondary treatment occur? What will that entail? Neither this paragraph nor the remainder of the fact sheet provide any further details.

The paragraph also includes several terms that are undefined and unclearly applied. For instance, the paragraph at different times refers to “protective levels” that have been set for radionuclides and also “radionuclide levels.” Are these terms interchangeable? Or do they mean different things? The paragraph also repeatedly refers to “regulatory limits” that will be complied with to protect human health and the environment. But there are no “regulatory limits” for radionuclides under Section 122 of the CWA because radionuclides are excluded from the statute’s definition of pollutants.<sup>38</sup> And CERCLA is a remedial statute, not a regulatory statute, so radionuclide “regulatory limits” are likewise missing there. DOE fails to define or explain what “regulatory limits” it is referencing. DOE then discusses “measured values” and “fish and surface water values,” before purporting to provide more information on “these values” without clarifying which values it is referencing. The Department also states that it will compare some combination of these “values” to “ensure protection of public health,” which notably leaves out any reference to CERCLA’s additional requirement that the remedial action also be protective of the environment and comply with all non-waived ARARs.<sup>39</sup>

In short, it is unclear to Community Groups how the public is supposed to provide meaningful input on the EMDF fact sheets when they are rife with undefined and intermixed terms as well as vague assertions with unclear implications. Apart from the informational gaps the fact sheets contain—which are discussed in more detail below—DOE’s confused presentation of the information itself prohibits the public from engaging with the fact sheets in a meaningful way.

*c. The fact sheets lack information necessary to allow the public to provide informed comments.*

Review of the EMDF fact sheets makes clear that the documents provide more questions than answers. In particular, the *Site Groundwater Characterization* fact sheet does not adequately address or provide:

- Whether and how DOE’s design of the EMDF landfill considers and incorporates the foreseeable increase in precipitation, storm events, and changed hydrologic conditions which will occur in East Tennessee due to climate change;
- Alternative remedial actions DOE will undertake if its upcoming field demonstration test at the EMDF does not result in predicted outcomes, including lowered groundwater levels at the proposed landfill site;
- Why “adjustments” may be made to observed groundwater elevations used to support EMDF design if there are “unusual amounts of rainfall” during the field demonstration project when, as mentioned, this area of East Tennessee is predicted to have a foreseeable increase in wet weather events<sup>40</sup>;
- Whether the public will be afforded another period of public comment if current ARARs and ARAR waivers are “revisit[ed]” based on findings from the future field demonstration project analyzing groundwater elevations at the proposed EMDF site.

**Response: The Groundwater Field Demonstration (GWFD) scope will be detailed and finalized in a post-ROD Remedial Design Work Plan, a primary document that requires approval by all three parties before implementation of the demonstration. This GWFD will provide additional characterization information, and while not itself a change to the remedy, has the potential to affect the final design of the facility. Results of the field study will be incorporated into the Remedial Design Report, which will present the final landfill design, and is also a primary document that requires approval by the FFA parties before landfill construction.**

**The landfill siting and design reduce concerns from climate change and provide resiliency to potential increase in rainfall and flood events through the following measures:**

- **Located outside the 100-year floodplain and on Pine Ridge, away from and at a greater elevation than Bear Creek. Waste elevation is approximately 60 ft higher than Bear Creek elevation in this area.**
- **Landfill does not cross one of the northern tributaries. Tributary immediately west of the landfill will be armored and widened to improve run-off. Tributary immediately east of the landfill will be diverted into an adjacent tributary. Culverts beneath the existing Haul Road will be oversized to improve drainage from the area and eliminate ponding.**
- **Upgradient diversion ditch is considerably oversized—greater than 100-year storm event.**

**Additional considerations will be part of the post-ROD final design.**

The *Waste Acceptance Criteria* fact sheet does not adequately address or provide:

- Whether the public will be afforded an opportunity to provide public comments on a finalized WAC, including a completed analytical WAC;
- Explanation for how issuance of a ROD prior to determining what waste and waste amounts will be accepted in the landfill complies with CERCLA’s requirement that RODs contain a determination that the remedial action is protective of human health and the environment and complies with all non-waived ARARs<sup>41</sup>;
- Necessary details regarding the “supplemental modeling on additional post-closure scenarios to ensure inventory limits do not result in an unacceptable risk” which DOE plans to perform for the EMDF, or whether the public will be able to provide public comment on this modeling and analysis<sup>42</sup>;

- Whether and in what ways the waste that will be accepted at the EMDF differs from the waste that has been disposed of at the EMWMF;
- Whether the performance assessment analysis to be undertaken by DOE will consider the decay chains and progeny of all disposed radionuclides;
- Community Groups also note that this fact sheet contains an assertion that the EMWMF “has operated safely for 20 years”<sup>43</sup> without any discussion or analysis of the landfill’s contamination of local groundwater or the multiple, unauthorized discharges of thousands of gallons of untreated wastewater containing radionuclides and other hazardous pollutants which DOE and its contractors have allowed to enter local waterways.<sup>44</sup>

**Response: WAC are contained in this ROD. Most of these WAC result from existing state and federal environmental regulations that are included in this ROD as ARARs (Administrative WAC). These WAC prohibit the higher radioactive waste from being disposed. For example, transuranic waste, greater than Class C (Nuclear Regulatory Commission) waste, and other wastes that contain radioactivity in excess of the limits specified in this ROD are prohibited from disposal. Experience with cleanup projects on the Oak Ridge Reservation indicates the volume of waste that exceeds WAC and requires offsite disposal is less than 10 percent by volume but contains greater than 90 percent of the radioactivity. Examples would include spent resins, some duct work, hot cell internals, and some equipment. Based on the projected inventory expected to be disposed in EMDF (consisting mainly of building demolition debris and soils), and in accordance with the WAC limits specified in Sect. 2.12.2.3 of this ROD, the final inventory of radionuclide contaminants will be protective of human health and the environment. These WAC limits will be implemented through the post-ROD, FFA parties-approved primary document, the WAC Compliance Plan.**

Finally, the *Water Quality Protection for Bear Creek* fact sheet does not adequately address or provide:

- Whether DOE has completed or plans to undertake any fish consumption studies regarding local populations who may participate in recreational or subsistence fishing in and around the Oak Ridge Reservation, including on Bear Creek and its downstream waterways;<sup>45</sup>
- What criteria DOE will use to determine whether secondary treatment is necessary for contaminated wastewater and leachate being discharged from the EMDF to Bear Creek;<sup>46</sup>
- Finalized radiological discharge limits from the EMDF;<sup>47</sup>
- Finalized mercury discharge limits from the EMDF which include mass limitations;
- How DOE’s fish ingestion exposure parameters, including exposure duration and fish ingestion rates, in Table A.2 of the *Development of Fish Tissue and Surface Water Preliminary Remediation Goals for Radionuclides of Interest for the Proposed Environmental Management Disposal Facility, Oak Ridge, Tennessee* (“PRG Report”),<sup>48</sup> as referenced in the fact sheet, provide full protection of Bear Creek’s designated use and will adequately protect human health and the environment given their inconsistencies with EPA guidance documents including but not limited to *Methodology for Deriving Ambient Water Quality Criteria for the Protection of Human Health*<sup>49</sup>;
- Whether required monitoring, detection, and reporting limits will enable sufficient quantification of radioactive and hazardous substance discharges from the EMDF to ensure protection of both human health and the environment;

- Whether required monitoring, detection, and reporting limits will enable effective evaluation of whether the discharges comply with promulgated water quality criteria for toxic substances in surface water designated for recreational use;
- Effluent discharge limits for hazardous pollutants which will allow attainment of ambient water quality criteria throughout Bear Creek;
- How discharges of PCBs and mercury from EMDF into Bear Creek, which is impaired by both substances, will not violate Tennessee's Antidegradation Statement, which is an ARAR for these hazardous pollutants.<sup>50</sup>

**Response: The specific remediation goals for landfill wastewater are specified in the ROD (Sect. 2.12.2.4). The approach was agreed upon among the FFA parties. The discharge limits will be developed in the future, based on the remediation goals, when the specifics of the EMDF landfill wastewater treatment systems are known, including the discharge location. The remediation goals and future discharge limits are within the CERCLA risk range and protective of human health and the environment.**

More broadly, none of these fact sheets address or provide critical information which the public must have in order to be able to effectively evaluate the safety and effectiveness of this proposed remedial action. This includes:

- A finalized RI/FS;
- A finalized FFS;
- DOE's response to EPA and TDEC's comments on the latest draft RI/FS, draft FFS, and D1 ROD;
- Clear identification of which ARARs are being used in the proposed remedial action;
- An analysis of how climate change will impact the preferred remedy;
- An analysis of the impacts DOE's selected remedy will have on environmental justice communities; and
- Any changes which have been made to the EMDF design as a result of lessons learned from the unauthorized discharges and pollution to local groundwater and surface water from the EMWMP.

Community Groups also incorporate by reference the concerns outlined by former TDEC employees in comments submitted to DOE on the EMDF fact sheets.<sup>51</sup>

Both TDEC and EPA have previously identified many of these concerns and highlighted this missing information in their comments on the D1 ROD. For instance, EPA has previously noted that without finalized effluent limits and instream criteria, the D1 ROD "is not consistent with" the National Contingency Plan requirements at 40 C.F.R. § 300.430(f)(5)(iii).<sup>52</sup> Similarly, TDEC has stated that the D1 ROD "lacks the information needed to demonstrate protective landfill wastewater discharge limits and waste acceptance criteria."<sup>53</sup> And both parties have highlighted DOE's failure to analyze the potential impacts that climate change will have on the proposed EMDF facility.<sup>54</sup>

Apart from the information currently still missing from the ROD, EPA has highlighted the incomplete nature of other CERCLA remedial documents. In particular, in its comments on the D1 ROD, EPA asserted that the FFS should be revised and approved by EPA and TDEC "prior to the issuance of the D2 EMDF ROD," and that these steps are necessary "to have an adequate Administrative Record supporting the final decision in the ROD."<sup>55</sup> Despite EPA and TDEC's efforts to highlight the still-missing and still-needed information to adequately analyze DOE's preferred remedial alternative prior to finalizing a ROD, neither

DOE's responsiveness summary nor these new EMDF fact sheets sufficiently address or remedy these deficiencies.

Finally, DOE's solicitation of public comment on the EMDF fact sheets does not comport with the public engagement scenario apparently agreed upon by DOE, EPA, and TDEC. In its comments on the D1 ROD, EPA noted that "EPA and TDEC have determined, and DOE has agreed, that the EMDF ROD merits additional public involvement activities before finalization. Public involvement should include new information developed since the September 2018 Proposed Plan *specifically the WAC, limits for radionuclides and mercury in surface water, and groundwater elevation at the proposed site location*. Resulting public comments and responsiveness should be included in the final ROD."<sup>56</sup> The EMDF fact sheets do not provide the information identified by EPA, TDEC, and DOE as being necessarily released to the public prior to engaging the public for comments. Accordingly, this information must be made available and a period of public comment reopened.

### **III. DOE Should Not Issue Any Draft Record of Decisions Until EPA has Completed Its Review of the Radionuclide Pollution Decision**

On June 9, 2021, EPA alerted Community Groups that it was in the process of reviewing a December 31, 2020 Radionuclide Pollution Decision<sup>57</sup> issued by former EPA Administrator Andrew Wheeler regarding proposed wastewater discharges to surface water from the EMDF facility.<sup>58</sup> Community Groups had previously alerted EPA to inconsistencies with the Radionuclide Pollution Decision and federal environmental law, including but not limited to discrepancies between the Radionuclide Pollution Decision and CERCLA's preference for technology-based effluent limitations (TBELs).<sup>59</sup> In response, EPA stated that, pursuant to Executive Order 13990 and in the context of Executive Orders 14008 and 13985, the agency was "in the process of reviewing the Decision."<sup>60</sup> To the best of our knowledge, that review is ongoing.

Despite EPA's current, active reconsideration of the Radionuclide Pollution Decision, DOE has published several documents which interpret and rely on the Radionuclide Pollution Decision to push forward the Department's haphazard effort to finalize its proposed CERCLA remedial action. This includes release of a D3 FFS on June 23, 2021, and a D1 ROD on July 12, 2021. DOE has now issued the EMDF fact sheets which appear to have been published in reliance on the Radionuclide Pollution Decision. For the same reason that publishing a D3 FFS and a D1 ROD were inappropriate, so too is it premature for DOE to issue these fact sheets for public comment. Namely, the information within them is predicated, at least in part, on a decision that is subject to ongoing review by EPA. DOE should delay issuing a D2 ROD until EPA culminates its review of the Radionuclide Pollution Decision, and a revised proposed plan should then be published for a period of public comment.

To the extent that the *Water Quality Protection for Bear Creek* fact sheet and the referenced PRG Report can be read as an implicit affirmation of the Radionuclide Pollution Decision by EPA, that Decision cannot be used to justify or override the clearly-stated preference in CERCLA for technology-based treatment.<sup>61</sup> Former Administrator Wheeler was not authorized to rewrite CERCLA in the Radionuclide Pollution Decision. There is no basis for eschewing technology-based treatment for radionuclides at EMDF or EMWMF, and indeed, there is strong basis in both law and fact for requiring it. In addition to the statutory requirements of CERCLA (and the technology-based treatment requirements of CWA as an ARAR), application of technology-based treatment would help ensure that *all* discharged radionuclides—including those known to the public as well as those classified from public view—are treated so that the remedy is in fact protective of public health and the environment.

Community Groups additionally maintain that, for the same reasons that former Administrator Wheeler misapplied the eight-factor analysis in 40 C.F.R. § 300.400(g)(2) to find that TBELs were not ARARs for

the discharge of radionuclides in this remedial action, he was also incorrect in finding that Tennessee's Antidegradation Statement was not an ARAR for radionuclide discharges. Namely, the CWA envisions a holistic water protection regime that begins with the premise that discharges should be treated with "the best practicable control technology" prior to discharge, and that more stringent limitations necessary to meet water quality standards then be applied as necessary.<sup>62</sup> In Tennessee, those water quality standards include the State's Antidegradation Statement.<sup>63</sup>

In the Radionuclide Pollution Decision, former Administrator Wheeler eschewed application of the first two lines of CWA defense—treating discharges and applying water quality standards which prevent the degradation of waters—to prioritize water quality based effluent limitations and designated use criteria as ARARs. The Radionuclide Pollution Decision is therefore properly viewed as an attempt to unlawfully preference weaker water quality standards in the CWA in contravention of the Act's plain purpose and intent.

**Response: The approach for preliminary remediation goals and discharge limits was developed and agreed upon among the FFA parties, including significant input and review from EPA Headquarters. With their involvement and concurrence, it is concluded that the review of the Dispute Resolution Decision is complete and the Decision has been upheld.**

#### IV. Conclusion

As EPA has so aptly noted, "there currently is no factual basis in the D1 ROD or the Administrative Record for this ROD" to justify DOE's assertion that the Department's preferred remedy at the ORR site "will meet [remedial action objectives], . . . will protect human and ecological receptors, and will prevent adverse impacts to surface water."<sup>64</sup> Specifically, EPA noted that any such statement was "premature" because "the draft ROD does not specify remediation goals[] and does not accurately apply ARARs [] related to compliance with certain CWA and TDEC water quality standards."<sup>65</sup> The EMDF fact sheets, among other shortcomings, do not supply this missing information or fail to demonstrate that it would sufficiently protect human health and the environment. And if EPA cannot effectively evaluate DOE's preferred remedial alternative given these deficiencies, neither can the public.

In order to rationally and lawfully select a remedial action under CERCLA, DOE must address the deficiencies outlined above before issuing a revised proposed plan for public comment. DOE should additionally issue this revised proposed plan only after EPA has made a determination on its review of the Radionuclide Pollution Decision. It is imperative that DOE takes these steps to comply with federal law and so that the legacy waste at the Oak Ridge Reservation is disposed of in a manner that actually ensures the health and safety of the local community and surrounding environment.

**Response: DOE thanks you for your participation in the public comment process. EMDF will be a permanent CERCLA waste disposal facility designed to the highest engineering standards to be protective of human health and the environment for waste that is generated from Oak Ridge National Priorities List (NPL) Site activities. The waste disposed in EMDF will primarily be soil and debris associated with the cleanup of the Y-12 National Security Complex and Oak Ridge National Laboratory that will meet the limits as documented in this ROD. The efficient remediation of the Oak Ridge NPL Site will eliminate the risks associated with contaminated soil and facilities in their current configuration and will consolidate that waste into an engineered facility that can be monitored and maintained. The remedy and selected site meet the CERCLA**

## threshold criteria of protecting human health and the environment and meeting regulatory requirements.

<sup>25</sup> Letter from Amanda Garcia, *supra* note 10.

As they did previously, Community Groups incorporate by reference the concerns outlined in a letter and accompanying attachment sent to EPA by several former Tennessee Department of Environment and Conservation (TDEC) employees. The letter and attachment provide context on the history and operation of the EMWRF and the proposed EMDF, highlight inconsistencies in the D1 ROD which must be addressed in a revised proposed plan, and shows how the current administrative record does not support a finding that the threshold criteria of protectiveness of public health and the environment and compliance with non-waived ARARs will be met. See Att. 7, Letter from Steve Goins et al. to Michael Regan (EPA), Re: Misinformation concerning the Department of Energy (DOE) Oak Ridge Reservation (ORR) Environmental Management Waste Management Facility (EMWRF) and the proposed Environmental Management Disposal Facility (EMDF) that affects the EMDF Record of Decision (ROD), Oak Ridge, Tennessee (Nov. 4, 2021).

<sup>45</sup> Community Groups have previously raised concerns regarding EMDF given the fishing practices of local communities. See Att. 10, Letter from Amanda Garcia et al. (SELC) to Carlton Waterhouse (EPA), Re: Additional Information Regarding Communities Potentially Affected by the U.S. Environmental Protection Agency’s Oversight of Cleanup Decisions at the Oak Ridge Reservation and the Radionuclide Pollution Decision (Feb. 16, 2022).

<sup>46</sup> See *EMDF Bear Creek* fact sheet, *supra* note 2, at 1 (“DOE will conduct secondary treatment as necessary . . .”).

Community Groups highlight comments submitted by TDEC on the D1 ROD, which discuss the standard and currently-in-use practice by DOE at the ORR to treat radionuclide discharge with ion exchange, to support its use as treatment for contaminated wastewater and leachate. Specifically, EPA stated that “[a] version of ion exchange treatment using media such as resins is the generally accepted approach for removing radiological constituents prior to discharge. DOE has and continues to use such wastewater treatment methods across the ORR and can lead the discussion of appropriate treatment media for radionuclides projected to be disposed in the EMDF.” Letter from Randy Young (TDEC) to Roger Petrie (DOE), Re: TDEC Comment Letter: Record of Decision for Comprehensive Environmental Response, Compensation, and Liability Act Oak Ridge Reservation Waste Disposal at the Environmental Management Disposal Facility, Oak Ridge Tennessee (DOE/OR/01-2794&D1), 11–12 (Oct. 8, 2021) (“TDEC Comments on D1 ROD”).

<sup>47</sup> EPA has previously identified the lack of finalized radiological discharge limits as impeding the Agency’s “ability to evaluate whether the ROD is protective and complies with ARARs.” U.S. Env’t Prot. Agency, *EPA Comments on the Record of Decision for Comprehensive Environmental Response, Compensation, and Liability Act Oak Ridge Reservation Waste Disposal at the Environmental Management Disposal Facility, Oak Ridge, Tennessee (DOE/OR/01-2794&D1)*, 1 (Oct. 6, 2021) (“EPA Comments on D1 ROD”).

Additional Comment 60: Comment from Keith L. Kline

I encourage your office to (a) clarify or correct the website information regarding public comments, (b) clarify what exactly will be disposed of in the EMDF, and (c) extend the time period for comments.

A. Currently, the website <https://www.energy.gov/ore/oak-ridge-office-environmental-management> lists upcoming events and indicates in large print: "May 9 Public comments due for EMDF Project." This gives typical readers the impression that they have already missed their opportunity to submit comments. One must click on the link or see the finer print details to discover that the comment period is currently May 9-June 7.

B. To conduct proper analysis and provide comments on the EMDF proposal, we need to have more information regarding exactly what types of materials are to be accepted for this facility. Details on the Waste Acceptance Criteria must be shared with the public and other agencies in order for informed decisions to be made.

C. Given the lack of clarity and lack of communication regarding the potential materials to be handled and therefore, their toxicity, and given that most local communities and stakeholders are NOT aware of the specific proposal because details are not provided, please allow at least 30 days for public comments from a date that follows the public release of more details on the proposed types and characteristics of wastes to be accepted at EMDF.

Thank you for considering these comments.

**Response: The U.S. Department of Energy (DOE) thanks you for your participation in the public comment process. The Environmental Management Disposal Facility (EMDF) will be a permanent Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) waste disposal facility designed to the highest engineering standards to be protective of human health and the environment for waste that is generated from Oak Ridge National Priorities List (NPL) Site activities. The waste disposed in EMDF will primarily be soil and debris associated with the cleanup of the Y-12 National Security Complex and Oak Ridge National Laboratory that will meet the limits as documented in this Record of Decision (ROD). The efficient remediation of the Oak Ridge NPL Site will eliminate the risks associated with contaminated soil and facilities in their current configuration and will consolidate that waste into an engineered facility that can be monitored and maintained. The remedy and selected site meet the CERCLA threshold criteria of protecting human health and the environment and meeting regulatory requirements.**

**WAC are contained in this ROD. Most of these waste acceptance criteria (WAC) result from existing state and federal environmental regulations that are included in this ROD as applicable or relevant and appropriate requirements (Administrative WAC). These WAC prohibit the higher radioactive waste from being disposed. For example, transuranic waste, greater than Class C (Nuclear Regulatory Commission) waste, and other wastes that contain radioactivity in excess of the limits specified in this ROD are prohibited from disposal. Experience with cleanup projects on the Oak Ridge Reservation indicates the volume of waste that exceeds WAC and requires offsite disposal is less than 10 percent by volume but contains greater than 90 percent of the radioactivity. Examples would include spent resins, some duct work, hot cell internals, and some equipment. Based on the projected inventory expected to be disposed in EMDF (consisting mainly of building demolition debris and soils), and in accordance with the WAC limits specified in Sect. 2.12.2.3 of this ROD, the final inventory of radionuclide contaminants will be protective of human health and the environment. These WAC limits will be implemented through the post-**

**ROD, Federal Facility Agreement (FFA) parties-approved primary document, the WAC Compliance Plan.**

**DOE has conducted additional work needed to support selecting a remedy in the ROD. DOE has worked with the other FFA parties to agree to a final list of applicable or relevant and appropriate requirements, and a final approach for WAC and discharge limits. These are details that typically are not included in a Proposed Plan. As these final elements did not change the essence of the disposal facility design nor change any of the protectiveness, effectiveness, implementability, or cost evaluation criteria, no additional public comment is required. However, with submittal of the D1 ROD, the FFA parties recommended additional public engagement, which included the May 9 to June 7, 2022 public comment period. That effort allows for additional public comment that is addressed within the D2 ROD.**

Additional Comment 61: Comment from Chuck Hope (from May 17, 2022 public meeting)

Hello, my name's Chuck Hope. C-H-U-C-K. H-O-P-E. First and foremost, I'm a citizen of Oak Ridge. I'm a long-time small business owner. I sit on city council, and I'm also the city council representative on the ECA, Energy Communities Alliance. We just got back from a tour of the [INAUDIBLE] project out in New Mexico. So, to say we know something about how the DOE facilities work and operate among themselves and how they interchange with each other is vitally important for the [INAUDIBLE] for our country. One of our biggest issues across the whole DOE complex is always going to be how do we clean it up, how do we take care of it and manage the waste. It's vitally important that we take care of that. We have to understand that. In that case, I'd like to thank Roger and his staff, the DOE, the folks at EPA and TDEC who continue to work on that. My question has always been about the WAC, waste acceptance criteria. We need to make sure that we clearly understand and define that because we're not just talking about building materials. That's predominantly what we're talking about in the disposal facilities. We've seen the success of what they've done with – and I'm an old-school guy. It's always going to be K-25, but it's the East Tennessee Technology Park – and how the gaseous diffusion plants have come down. This is a big milestone for the Department of Energy. It's one of the biggest projects they've been [INAUDIBLE] to do to date, and it has a very high success rate. But as we move into the Y-12 valley and National Lab valley, the difference in the [INAUDIBLE] waste and the waste criteria that goes into this disposal facility does change. We need to make sure that we're aware of that, and we need to make sure that we understand that directly going forward. I think that's been the biggest stumbling block for us as citizens of Oak Ridge to make sure that we understand that. The engineering of the project, how we're going to manage the project, it's been done and been proved before. I can see that happening. I don't think we'll have any problem with the success of that. But, you know, this is something—Roger said it earlier. He made it in his opening statement. This is something we're going to have in our backyard into perpetuity. So, I mean, we're going to be there forever, and we're going to have to make sure we manage that. One of the questions I have is, as this moves from environment management into legacy management, how does that change? What changes? That's very important because we're not looking at things with decisions we're making today but 10, 20, 30 years from now or even longer. How does that change? So, that'd be a very important question that I'd like to have answered as well. So, in closing, I would just say that as long as we can continue to understand the waste criteria [INAUDIBLE], we need to understand that. We need to have a clear definition of that. My last statement I would make is as much as I appreciate EPA, TDEC, and DOE making the decisions, we're not at the table. The City of Oak Ridge, citizens of Oak Ridge are being represented by these three organizations. So, just remember, we'd like to be at the table as well when making these decisions about our backyard.

**Response: The U.S. Department of Energy (DOE) thanks you for your participation in the public comment process. The Environmental Management Disposal Facility (EMDF) will be a permanent Comprehensive Environmental Response, Compensation, and Liability Act of 1980**

**(CERCLA) waste disposal facility designed to the highest engineering standards to be protective of human health and the environment for waste that is generated from Oak Ridge National Priorities List (NPL) Site activities. The waste disposed in EMDF will primarily be soil and debris associated with the cleanup of the Y-12 National Security Complex and Oak Ridge National Laboratory that will meet the limits as documented in this Record of Decision (ROD). Additional Comment 62: Comment from Marion Burger

I am very uncomfortable about the limited amount of information that is included in your fact sheets, as was pointed out by several scientists and engineers at the recent DOE public hearing. I know the resumes and reputations of some of those professionals, and they are very well-qualified. They, and we who live in the Oak Ridge area, deserve to receive clear, forthright responses to their questions and concerns before any approvals for the landfill.

Thank you for the opportunity to comment.

**Response: The U.S. Department of Energy (DOE) thanks you for your participation in the public comment process. The Environmental Management Disposal Facility (EMDF) will be a permanent Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) waste disposal facility designed to the highest engineering standards to be protective of human health and the environment for waste that is generated from Oak Ridge National Priorities List (NPL) Site activities. Additional Comment 63: Comment from Alfreda Cook

I am responding to the opportunity for comment on the public meeting hosted by the DOE on May 17, 2022, that provided an update on the Proposed Plan for construction of the new Environmental Management Disposal Facility (EMDF). The three fact sheets that were presented provided a high-level overview of planned actions but failed to address specific concerns as reported by TDEC and EPA – as Federal Facility Agreement partners with DOE – and how resolution of those concerns has progressed to-date. Of course, documents with in-depth detail of those concerns are available for public access, but interpreting that information is time-consuming and often requires knowledge of environmental regulations that the average citizen does not possess. I had expected the DOE to offer pros and cons to the Proposed Plan such that the public could evaluate the supporting rationale. I left the meeting feeling that I had heard a “sales pitch” that promoted the needs of DOE.

Note that I reside in Country Club Estates, which is the residential area closest in proximity to the planned EMDF. I depend on TDEC and EPA to protect my best interests in regard to human health and the environment, and I expect DOE to prioritize those interests when developing budgets and project schedules for clean-up of the Oak Ridge Reservation. With those comments in mind, I offer the following suggestions:

- Schedule quarterly public meetings to report progress toward resolution of concerns as identified by FFA partners and other concerned community organizations
- Issue a revised Proposed Plan that addresses how current concerns will be alleviated
- Discuss specific “lessons learned” from 20-year operation of the existing Environmental Management Waste Management Facility (EMWMF) and how those lessons will be incorporated into design, construction, and management of the EMDF
- Discuss whether a wastewater treatment facility will be constructed at EMDF for immediate processing of contaminated leachate and surface water to prevent the need for collection basins that have potential to overflow during heavy rainfall and discharge hazardous liquids into nearby waterways
- Discuss the course of action if contaminants are found during building demolition at ORNL and Y-12 that exceed EMDF waste acceptance criteria
- Discuss whether waste from old burial sites in Bear Creek Valley are planned for future excavation or other remedial actions.

**Response: Response: The U.S. Department of Energy (DOE) thanks you for your participation in the public comment process. The Environmental Management Disposal Facility (EMDF) will be a permanent Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) waste disposal facility designed to the highest engineering standards to be protective of human health and the environment for waste that is generated from Oak Ridge National Priorities List (NPL) Site activities. That effort allows for additional public comment that is addressed within the D2 ROD.**

**DOE works to continuously improve its efforts involving the cleanup mission at the Oak Ridge Reservation through lessons learned. DOE, along with their contractors, has implemented and follows a waste disposal hierarchy that prioritizes waste disposal in non-radiological onsite disposal facilities over the Environmental Management Waste Management Facility, provided characterization allows this path. DOE has a mature and robust process for the characterization of CERCLA waste generated from remedial actions at the Oak Ridge NPL Site. Plans for remedial actions including waste disposal are subject to approval by the regulatory agencies prior to the implementation of work at the Oak Ridge NPL Site. The potential for waste material to be inappropriately disposed of onsite is minimal.**

Additional Comment 64: Comment from Peter Scheffler

I understand the general features of the project, thanks to the fact sheets.

Specific concerns:

Groundwater at the site, even in the knoll, may not be totally due to rainfall but also “artesian” groundwater flowing from higher elevations surrounding the site through fractures in the bedrock and soil.

How has the effect of climate change on groundwater and surface water been factored into the design of the project?

The demonstration project should be completed before issuance of the Record of Decision, so that the project managers know whether it indicates the site is adequate and the EDMF properly designed.

There needs to be an opportunity for public comment on the Waste Acceptance Criteria before the ROD is issued. The criteria MUST NOT allow for “dilution” of contaminants by including waste material which is not contaminated. That in essence would result in filling the EDMF prematurely.

The WAC Compliance Plan should be developed and submitted for public comment before the ROD is issued.

What will be done with the residuals other than mercury from the treatment of EMDF wastewater and leachate?

Finally, Mr. Petrie mentioned in his introductory remarks at the public meeting that the ridge between the EMDF and the Scarboro community protects the community from the possibility of contaminated groundwater. My comment above about possible “artesian” groundwater at the site also applies to the possibility of such groundwater at locations elsewhere with lower elevations than the EMDF site, regardless of intervening topography. (In this regard, I agree with Pastor Hammond and Martin McBride that DOE needs to put substantial effort and funding into redressing historical negative effects on Scarboro from environmental contamination, even if due only to unfounded negative perceptions of contamination.)

**Response:** The U.S. Department of Energy (DOE) thanks you for your participation in the public comment process. The Environmental Management Disposal Facility (EMDF) will be a permanent Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) waste disposal facility designed to the highest engineering standards to be protective of human health and the environment for waste that is generated from Oak Ridge National Priorities List (NPL) Site activities. The waste disposed in EMDF will primarily be soil and debris associated with the cleanup of the Y-12 National Security Complex (Y-12) and Oak Ridge National Laboratory (ORNL) that will meet the limits as documented in this Record of Decision (ROD). The efficient remediation of the Oak Ridge NPL Site will eliminate the risks associated with contaminated soil and facilities in their current configuration and will consolidate that waste into an engineered facility that can be monitored and maintained. The remedy and selected site meet the CERCLA threshold criteria of protecting human health and the environment and meeting regulatory requirements.

The landfill siting and design reduce concerns from climate change and provide resiliency to potential increase in rainfall and flood events through the following measures:

- Located outside the 100-year floodplain and on Pine Ridge, away from and at a greater elevation than Bear Creek. Waste elevation is approximately 60 ft higher than Bear Creek elevation in this area.
- Landfill does not cross one of the northern tributaries. Tributary immediately west of the landfill will be armored and widened to improve run-off. Tributary immediately east of the landfill will be diverted into an adjacent tributary. Culverts beneath the existing Haul Road will be oversized to improve drainage from the area and eliminate ponding.
- Upgradient diversion ditch is considerably oversized—greater than 100-year storm event.

Additional considerations will be part of the post-ROD final design.

The Groundwater Field Demonstration (GWFD) scope will be detailed and finalized in a post-ROD Remedial Design Work Plan, a primary document that requires approval by all three parties before implementation of the demonstration. This GWFD will provide additional characterization information, and while not itself a change to the remedy, has the potential to affect the final design of the facility. Results of the field study will be incorporated into the Remedial Design Report, which will present the final landfill design, and is also a primary document that requires approval by the Federal Facility Agreement (FFA) parties before landfill construction.

WAC are contained in this ROD. Most of these waste acceptance criteria (WAC) result from existing state and federal environmental regulations that are included in this ROD as applicable or relevant and appropriate requirements (ARARs) (Administrative WAC). These WAC prohibit the higher radioactive waste from being disposed. For example, transuranic waste, greater than Class C (Nuclear Regulatory Commission) waste, and other wastes that contain radioactivity in excess of the limits specified in this ROD are prohibited from disposal. Experience with cleanup projects on the Oak Ridge Reservation indicates the volume of waste that exceeds WAC and requires offsite disposal is less than 10 percent by volume but contains greater than 90 percent of the radioactivity. Examples would include spent resins, some duct work, hot cell internals, and some equipment. Based on the projected inventory expected to be disposed in EMDF (consisting mainly of building demolition debris and soils), and in accordance with the WAC limits specified in Sect. 2.12.2.3 of this ROD, the final inventory of radionuclide contaminants will be protective of human health and the environment. These WAC limits will be

**implemented through the post-ROD, FFA parties-approved primary document, the WAC Compliance Plan.**

**DOE has worked with the other FFA parties to agree to a final list of ARARs, and a final approach for WAC and discharge limits. As these final elements did not change the essence of the disposal facility design nor change any of the protectiveness, effectiveness, implementability, or cost evaluation criteria, no additional public comment is required. However, with submittal of the D1 ROD, the FFA parties recommended additional public engagement, which included the May 9 to June 7, 2022 public comment period. That effort allows for additional public comment that is addressed within the D2 ROD.**

**Existing and new data from hundreds of wells in Bear Creek Valley show groundwater flow from Pine Ridge towards Bear Creek and away from residential areas. Groundwater contamination is primarily located closer to Bear Creek in the upper part of the valley (as indicated in the 2021 Remediation Effectiveness Report). This data supports the conclusion that contamination in the valley cannot reach residential areas.**

**The comment expresses concern of a socioeconomic nature. Jobs associated with construction and operation of the facility, and the acceleration of cleanup enabled by onsite disposal and subsequent opportunities that it would present to Y-12 and ORNL, are expected to benefit both the economy and perception issues associated with environmental conditions in Oak Ridge. DOE points to the recent socioeconomic study supporting the landfill that is referenced and summarized in this ROD (see Sect. 2.10.11).**

Additional Comment 65: Comment from Jessica Briggs

Please make sure any toxic waste removal and disposal does not contaminate the water ways and soils.

**Response: Response: The U.S. Department of Energy (DOE) thanks you for your participation in the public comment process. The Environmental Management Disposal Facility (EMDF) will be a permanent Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) waste disposal facility designed to the highest engineering standards to be protective of human health and the environment for waste that is generated from Oak Ridge National Priorities List (NPL) Site activities. The waste disposed in EMDF will primarily be soil and debris associated with the cleanup of the Y-12 National Security Complex and Oak Ridge National Laboratory that will meet the limits as documented in this Record of Decision. The efficient remediation of the Oak Ridge NPL Site will eliminate the risks associated with contaminated soil and facilities in their current configuration and will consolidate that waste into an engineered facility that can be monitored and maintained. The remedy and selected site meet the CERCLA threshold criteria of protecting human health and the environment and meeting regulatory requirements.**

Additional Comment 66: Comment from Sandra Goss (from May 17, 2022 public meeting)

My name is Sandra. S-A-N-D-R-A. I didn't write that. I just tried to write "S." My last name is Goss. G-O-S-S. My thick Southern tongue gets that wrong, so let me say, G-O-Sam-Sam. I'm the executive director Tennessee Citizens for Wilderness Planning. We're an Oak Ridge-based environmental advocacy organization. We've been in action now since 1966, and we have a big interest in decent air to breathe, pure water to drink, and adequate habitat for all creatures. I appreciate all this big information that we've gotten today, and I know it's taken some effort to pull it together and to present it in ways that the public can understand. I look forward to delving into this information in more detail, and when I do that, I hope I find out how is the mercury hazardous waste going to be shipped and where? I hope so much – I guess more

than anything – that we read about a climate change model selection, in other words, that when you’ve been working on this, that you’ve looked carefully at all these models of climate change weather, making the choice of the one that will be applied in this plan and then make plans accordingly. I’m a little uneasy with the idea that some of these arrangements are going to be decided more or less in process, and I want to urge the appropriate bodies to include the citizenry of our community here with information about how these experiments work out. I am very interested in this final layer of plastic that isn’t going to let any rainwater through it. Very exciting. And I’d like to know the vendor on that, and maybe a little stock purchase might be necessary. That’s the end of my comments, and thank you very much.

**Response: Response: The U.S. Department of Energy (DOE) thanks you for your participation in the public comment process. The Environmental Management Disposal Facility (EMDF) will be a permanent Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) waste disposal facility designed to the highest engineering standards to be protective of human health and the environment for waste that is generated from Oak Ridge National Priorities List (NPL) Site activities. The waste disposed in EMDF will primarily be soil and debris associated with the cleanup of the Y-12 National Security Complex and Oak Ridge National Laboratory that will meet the limits as documented in this Record of Decision (ROD). The efficient remediation of the Oak Ridge NPL Site will eliminate the risks associated with contaminated soil and facilities in their current configuration and will consolidate that waste into an engineered facility that can be monitored and maintained. The remedy and selected site meet the CERCLA threshold criteria of protecting human health and the environment and meeting regulatory requirements.**

Decisions on waste volume reduction or mercury treatment are the responsibility of the generating project and associated decision documents. The EMDF will have waste acceptance criteria (WAC) that specify what waste is allowed and in what form. The projects must comply with the WAC but for waste that does not meet the WAC, the projects can further treat the waste if in compliance with EMDF requirements or send the waste to an alternative disposal location. With regard to mercury hazardous waste (Resource Conservation and Recovery Act of 1976 [RCRA] D009 code), that waste is prohibited from disposal in EMDF.

DOE will meet all regulatory requirements pertaining to mercury treatment and onsite disposal of waste, including RCRA requirements that dictate WAC for mercury. The regulatory compliant design, operation, and closure of the onsite disposal facility, coupled with DOE’s compliance with all regulatory requirements concerning mercury, will help to ensure that the new disposal facility is protective of human health and the environment over the long term. For West End Mercury Area remediation projects with EMDF-bound waste streams, DOE will take all practical measures to remove mercury before waste generation and send that mercury offsite to treatment/storage/disposal facilities.

The landfill siting and design reduce concerns from climate change and provide resiliency to potential increase in rainfall and flood events through the following measures:

- Located outside the 100-year floodplain and on Pine Ridge, away from and at a greater elevation than Bear Creek. Waste elevation is approximately 60 ft higher than Bear Creek elevation in this area.
- Landfill does not cross one of the northern tributaries. Tributary immediately west of the landfill will be armored and widened to improve run-off. Tributary immediately east of the landfill will be diverted into an adjacent tributary. Culverts beneath the existing Haul Road will be oversized to improve drainage from the area and eliminate ponding.

- **Upgradient diversion ditch is considerably oversized—greater than 100-year storm event.**

**Additional considerations will be part of the post-ROD final design.**

**The Groundwater Field Demonstration (GWFD) scope will be detailed and finalized in a post-ROD Remedial Design Work Plan, a primary document that requires approval by all three parties before implementation of the demonstration. This GWFD will provide additional characterization information, and while not itself a change to the remedy, has the potential to affect the final design of the facility. Results of the field study will be incorporated into the Remedial Design Report, which will present the final landfill design, and is also a primary document that requires approval by the Federal facility Agreement parties before landfill construction.**

Additional Comment 67: Comment from William A. Rose

Where will all the soil/dirt come from for this proposed project?

**Response: The U.S. Department of Energy thanks you for your participation in the public comment process. Materials from excavation of the site will be used wherever possible, and if needed, borrow material for the Environmental Management Disposal Facility (EMDF) construction will be obtained from the knoll just east of the facility and other locations at the Oak Ridge Reservation, which will be developed during the Early Site Preparation phase of construction. Section 2.12.2.2 of this Record of Decision provides additional discussion of construction activities.**

Additional Comment 68: Comment from Gareth Davies

This is somewhat of a dissertation, but there are some fundamental issues that apply directly to groundwater work that has been done by DOE and its contractors on the Oak Ridge Reservation and at the proposed EMDF site (and actually they would apply to anywhere where there are bedrock aquifers). The proposed EMDF site is located on Pine Ridge, in fractured clastic interbedded shale, sandstone, siltstone and carbonate rocks. The hydraulic conditions in such a setting means that it is not possible to average conditions because there are different lithologies with different hydraulic conductivities. It is common knowledge that there is and will be in all bedrock, preferential flow in fissures, channels and conduits (see also numerous other references for the conditions in several lithologies [Worthington et al., 2016]). However, the general conceptual model approach used by most hydrogeologists is to assume something called the *porous medium*. This approach is based upon flow in an ideal system that is assumed to be both homogeneous (consisting of parts all of the same kind) and isotropic (having physical properties which have the same value when measured in different directions). This approach originated from work done by Henry Darcy. Darcy (1856) was tasked with finding a water source for the City of Dijon in eastern France. The original report of the work is translated by Bobeck (2004). During this work he wrestled with water filtration and performed many experiments in sand and gravel columns. He realized that there would be a loss of hydraulic pressure and discharge with the flow through sand and gravel. He solved these problems and derived the mathematical relationships. However, these were conducted in columns of unconsolidated sands and gravels. Actually, Darcy in the report for Dijon (Darcy, 1856) discusses many other aspects of flow in bedrock and channels in the subsurface to springs and artesian wells, a subject where there is little or no discussion in much of the hydrological literature.

A summary by Worthington: “*The experiments by Darcy (1856) that led to the formulation of Darcy’s law represented a major advance in hydrogeology (Fetter 2004). However, Darcy and other leading hydrogeologists like Dupuit, Chamberlin, Daubre e, Meinzer, and Theis all recognized that many aquifers*

*do not behave as porous media but instead as more complex media with preferential flow in fractures and channels.”*

The source of water he found and used for Dijon is the Rosoir Spring about 12.5 km northwest of the city. He constructed an aqueduct to get the water to the city but found he would have to filter the water before its use. For this he constructed an apparatus to determine any hydraulic head loss that would happen during the filtration. He used sand and gravel for filtration and thus derived equations that described the results. This is known as the Darcy Equation. Bobeck (2004) has translated the entire Darcy (1856) report. The filtration work is in one short section (3 - 4 pages) of Appendix D of a report of 500 + pages plus plates.

It is worth mentioning that Darcy had early on established that the Rosoir Spring was flowing from “underground pipes” – (conduit) which was subsequently shown by cave divers exploring several kilometers of passages. This is discussed by Worthington and Gunn (2009).

The general position adopted by groundwater professionals early on up to and within the 1900’s in the US and elsewhere was implicit assumption that most aquifers would be found in sand and gravels accumulated in valleys and that Darcy’s Law could be used to describe flow in those settings. This use of sand as a type lithology and Darcy’s Law to calculate the rate of groundwater movement is confirmed in Simmons (2007). However, it should be noted that a reading of the Dijon fountains report (Darcy, 1856) shows numerous statements and illustrations of his idea that there are conduits in the subsurface and some may be filled with sand.

The Darcy equation uses a hydraulic gradient, cross sectional area (of a flume) and a value for the permeability that is called the hydraulic conductivity. The hydraulic conductivity number is a value that has to be calculated (or estimated). Many academic texts have tables of hydraulic conductivity values for various settings and lithologies (Freeze and Cherry, 1979, p.29, Table 2.2).

Simmons (2007) additionally references Mead (1919) and Slichter (1905) relating that workers did not know how to apply hydraulic conductivity when using Darcy’s Law and this led instead to direct measurements of groundwater velocity in aquifers rather than use Darcy’s Law, this was similar to doing tracer tests (Simmons, 2007).

It should be pointed out that the mentality at this time still involved flow and velocity in sand and does not yet address bedrock issues and how to take some volume of bedrock with fissures and fractures and within that apply Darcy’s Law. Darcy (1856) on page 80 discusses artesian wells and talks about flow in subsurface channels even using the term underground streams.

Hubbert (1940) in the *Theory of Ground-Water Motion* quickly assumes using Darcy’s Law and flow through an “*isotopic medium.*” Nothing much changed but subsequently USEPA Regulations were developed around implicit assumption of the porous medium, overall validity of Darcy’s Law and the use of monitoring wells.

The original RCRA and CERCLA regulations implicitly use a porous medium approach, and only use well - based monitoring techniques. The aquifer testing techniques (slug tests and pumping tests) implicitly make the same assumptions of a porous medium. Another assumption in most regulations assume flat-bedded situations with an impermeable base. Although this can be the case in valleys filled with geologically younger unconsolidated sediments, it is rarely the case for bedrock and certainly not bedrock with any structure (bedding planes, joints, folds and faults).

During the late 1970’s and 1980’s the published literature started to include papers that pointed out that the USEPA regulations did not allow reliable monitoring in karst. Bradbury and Muldoon (1990) followed by

discussing fractured rocks. Quinlan and Ewers (1986) initiated the conversation on karst. They implied that poor monitoring performance was caused by the inability of borings and wells to penetrate conduits, and particularly main conduits to which there would be convergent flow, so it was very important to monitor main conduits. However, the probability of intersecting these with borings and constructed wells was very low. There was much documentation that showed sites being inadequately monitored and in carbonates contamination being transport many kilometers and with velocities of more than 1 km/day.

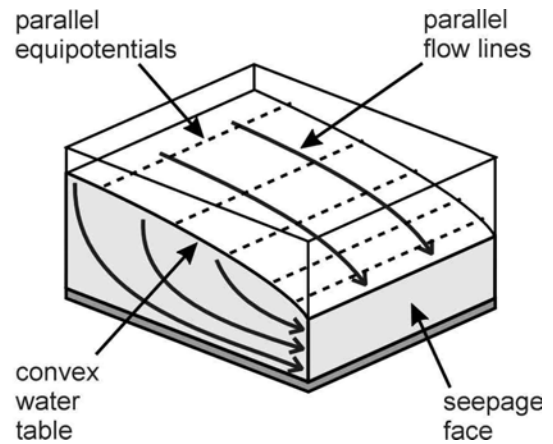

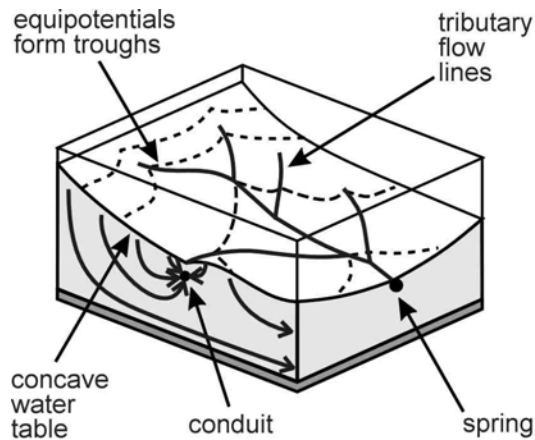

Another problem was illustrated by Smart (1999). He suggests that many wells only intersect subsidiary (tributary) channels/conduits with regards to what they sample and interpreting the correct hydraulic head and contaminant data therein is difficult and may not be possible. Quinlan (1989) was the first USEPA initiative that addressed karst and tracer tests. This was followed by Well-Head and Spring-Head protection manual development for USEPA Region 4 (USEPA 1997). All of these documents say that tracing would be necessary in karst.

In 1996 the American Society for Testing and Materials formed a subcommittee and task group to develop a Standard Guide for the Design of Ground Water Monitoring Systems in Karst and Fractured-Rock Aquifers. This was the first consensus document (ASTM D5717-95 - later D5717-96) and in the introduction makes the point that such a setting should not be considered a porous medium. This “karst and fractured rock” implies all fractured rock lithologies, not just karst (for example, carbonates). The publication of D5717-96 initiated further discussions about non-carbonate fractured rocks and initiated a discussion about a definition of karst in terms of monitoring and the regulations.

In 1996 the American Society for Testing and Materials formed a subcommittee and task group to develop a Standard Guide for the Design of Ground Water Monitoring Systems in Karst and Fractured-Rock Aquifers. This was the first consensus document (ASTM D5717-95 - later D5717-96) and in the introduction makes the point that such a setting should not be considered a porous medium. This “karst and fractured rock” implies all fractured rock lithologies, not just karst (for example, carbonates). The publication of D5717-96 initiated further discussions about non-carbonate fractured rocks and initiated a discussion about a definition of karst in terms of monitoring and the regulations.

ASTM has recently formed a new subcommittee on karst (D18-27) and is meeting and writing several new documents that address important issues in karst. In addition the D5717-96 document has to be updated and that is also being done. The author of these comments was the vice-chairman of the task group for writing of D5717-96 and is the Task Group leader for doing the update.

Worthington (2001) made a comparison of an ideal porous medium (below, right) and a typical carbonate aquifer (below left). The parameters of the depicted ideal porous medium are based upon theory, the parameters of the carbonate aquifer are from physical evidence, empirical data and calculations. Note that the ideal porous medium has no sinking streams and no springs, so just the existence of those two features would effectively invalidate the existence of a porous medium at any site (they are present at the proposed EMDF site). It appears from subsequent work, especially having sinking streams, springs, tracing and hydraulic gradients that many fractured non-carbonate (clastic) rock sites behave more like a carbonate setting. A question for DOE and its

contractors would be: do they consider the site to be a porous medium? Do they consider it to have homogeneous and isotropic conditions? Do they choose to ignore the professional consensus?

So, in using only wells DOE and its contractors implicitly assume that the site does behave like a porous medium and they implicitly do not follow the professional consensus set by ASTM (1996) advised by OMB A-119 and as advised and revised in all the regulations. Unfortunately they are ignoring the conceptual advances made over 40 years of work to improve monitoring and further protect the public and the environment in this type of terrain.

Many tracer tests have been done in carbonates, but in addition now in many other bedrock settings (Worthington et al., 2016). That work includes a database of traced velocities in the major types of bedrock more, and more recently Klein and Davies (2017) included tracer test velocities in clastic (non carbonate) rocks including several from the Oak Ridge Reservation, some done by DOE and its contractors. It is noted that some tracer tests have been done in the same lithology as the proposed EMDF, have those data been used, they may be the most representative.

Contaminants as tracers. Contaminants are typically excellent tracers, and in particular many radionuclides. Uranium in groundwater was established as a tracer by Osmond and Cowart (1976) - where in many cases it can be quantitative. The signatures created by, for example, depleted uranium in Bear Creek Valley are - let's say (understating) significant. Uranium, if used correctly (Osmond and Cowart, 1976 show how) can be used as a tracer that will not only delineate sources but also show discharge locations, and is quantitative with regards to the mass (plotted reciprocal of the concentration in micrograms/liter) of uranium in a given volume.

At this point it is important to discuss the mobility of uranium. Gascoyne (1993) fully discusses this and it is obvious that uranium will be soluble in open, oxidized waters particularly with the presence of bicarbonate and several other anions. DOE and its contractors most of the time state incorrectly that uranium is not mobile. They need to provide the geochemical evidence for this position. One common position is that the waters have to be in contact with carbonate rocks.

## Natural Waters – Anion Geochemistry (from Hembrey et al., 1952, US Geol. Circ. 170)

| Dissolved Substance                                           | Granite Substrate | Limestone Substrate | Gypsum Substrate | Shale Substrate |
|---------------------------------------------------------------|-------------------|---------------------|------------------|-----------------|
| HCO <sub>3</sub> <sup>-</sup> , CO <sub>3</sub> <sup>2-</sup> | 15.9              | 86.3                | 101.8            | 163.6           |
| Ca <sup>2+</sup>                                              | 10.0              | 32.2                | 121.4            | 139.4           |
| Mg <sup>2+</sup>                                              | 0.9               | 17.1                | 40.0             | 76.8            |
| H <sub>4</sub> SiO <sub>4</sub>                               | 11.9              | 10.1                | 10.2             | 6.1             |
| SO <sub>4</sub> <sup>2-</sup>                                 | 3.2               | 5.7                 | 383.9            | 1212.0          |
| Na <sup>+</sup> + K <sup>+</sup>                              | 0.5               | 1.9                 | 55.3             | 410.1           |
| Cl <sup>-</sup> + NO <sub>3</sub> <sup>-</sup>                | 0.6               | 4.7                 | 14.5             | 12.1            |
| Total ppm                                                     | 43.0              | 158.0               | 727.1            | 2020.1          |

The most dominant anions are always HCO<sub>3</sub><sup>-</sup>, CO<sub>3</sub><sup>2-</sup> (obviously except for gypsum, shale: Na<sup>+</sup>, K<sup>+</sup>, SO<sub>4</sub><sup>2-</sup>) and their biggest source is the atmosphere, note the larger concentration in shales as compared to limestone substrates, granites could be an analogue for sandstones. The lack of carbonate rock obviously would not mean a lack of HCO<sub>3</sub><sup>-</sup>, CO<sub>3</sub><sup>2-</sup>. I have successfully used uranium isotopes as a natural tracer in geological settings from the Rocky Mountains to the coastal plain

The table above shows how incorrect this would be (from Blatt et al., 1972). If a porous medium approach is used then Darcy's equation for groundwater discharge is often used. Freeze and Cherry (1979) (page 73) state that Darcys Law is probably invalid because of turbulent flow in "karst, dolomites and cavernous volcanics" Subsequently Quinlan et al., (1996) describe this more rigorously using: the minimum traced velocity in conduits in carbonates (0.001 m/s), typical Reynolds numbers, the onset of turbulent flow could happen in fissures of a width of a few millimeters. They described a conduit size this way. This would implicitly suggest that many fractured clastic rocks might yield generally the same results - their tracing results are often comparable. At this point it is important to discuss the mobility of uranium. Gascoyne (1993) fully discusses this and it is obvious that uranium will be soluble in open, oxidized waters particularly with the presence of bicarbonate and several other anions. DOE and its contractors most of the time state incorrectly that uranium is not mobile. They need to provide the geochemical evidence for this position. One common position is that the waters have to be in contact with carbonate rocks.

However, Worthington et al., (2016) show how in non-carbonates fissures increase in width as weathering or alteration progresses. In all bedrock aquifers a positive feed-back loop results as fissures widen and allow more recharge water to enter, thus allowing more alteration. The main difference between carbonates and clastic and non carbonate rocks is the dissolution. These authors suggest in carbonates dissolution is congruent in that all the solute is likely to be removed enlarging the porosity. In non-carbonates (e.g., silicates) there would still be some dissolution or really alteration converting feldspar and other silicate minerals to clays. These might reduce the porosity. However they show that in that many settings there appears to more extensive alteration with depth in silicates and such - because of the surface area that is being altered and the alteration rate is higher in the direction of the fissure (implied vertically).

It should be emphasized that the inadvertent discharge of contaminants or contaminated waters into Bear Creek would be very unfortunate. This is not because of the contamination of Bear Creek itself, but because of the fact that Bear Creek, at low stage sinks into its own bed. TDEC (2001) includes information about a tracer test that was done along Bear Creek and showed how that surface water sinks into its bed and thereafter does not simply rise again, but discharges from springs (SS-4, SS-5). The TDEC tracing shows velocities in the km/day range - totally normal for carbonates whether called karst or not. The tracer was added to the discharge of Bear Creek near the location of the EMWMF and sinks at various locations

downstream of that. It should be noted that the tributaries of Bear Creek on the NW side also, in dry conditions, sink into their own beds - some (in dry conditions it be many) before they reach Bear Creek. This is normal for fractured rocks of any of the main lithologies.

The only way that it can be determined where these waters eventually discharge to is by doing additional tracing at the proposed site and beyond, and that includes the tributaries and Bear Creek itself, and continue the tracing to any offsite receptors. This can be done using multiple tracers.

It does not appear that the sinking surface or groundwater is returning to discharge at surface water downstream for several reasons. The first is that all the springs in Bear Creek Valley are overflow springs. These types of springs do not discharge all the time - so aquifer water must be discharging at lower elevation springs when the higher level springs (overflow springs) are not discharging. This vertical hierarchical nature of discharge is normal as it can be observed in groundwater basins everywhere. The nature of this type of discharge was first explained by Worthington (1991) in karst. It was shown to be the normal case where extensive knowledge of groundwater basins was obtained by Quinlan and Ray, (1989).

The complication in Oak Ridge are the TVA structures on the rivers (Melton Lake Dam and Watts Bar Dam). If continuous monitoring at springs next to the Clinch River is done what should be seen is that the springs near the river banks do not operate as "normal karst springs" [of which a substantial amount is known] when the pond levels are high and the discharge of the springs are inundated. When the pond levels are lowered the springs behave as normal karst springs.

A uranium-series plot of sources and discharges (using methods as outlined by Osmond and Cowart, 1976) does not suggest a simple system where groundwater discharges to surface water (unpublished work). The existing data strongly suggest that this water sinks and feeds groundwater. This is simply supported by the shallow hydraulic heads being higher than the deeper heads. From the uranium-series data it would be possible to use uranium-series as a powerful tracer in the whole system in surface water and groundwater, and would work as far as discharge to the oceans as shown in Osmond and Cowart, (1976).

The offsite pathways are likely very deep and long. During the past few decades, drilling for oil in the subsurface west of Nashville reaches fresh water at a depth of > 1,200 meters (~4,000 ft). This should not be a shock as this is penetrating the Knox Group and it is known that fresh water has also been encountered in the Knox Group at over 3,500 meters below the surface. Banner et al., (1989) show similar depth of circulation across the US mid-continent and the source of water feeding springs in central Missouri, where from the stable isotope data the recharging water must be recharging from over 3,000 m above sea level. This conceptual model began with some work done in the 1990's to explore the origin of Pb-Zn deposits across the US mid-continent (Garven et al., 1990). The whole concept suggests that there are very deep flow paths involved. This can be tested with natural stable isotope tracing or a combination of uranium-series and stable isotope data from groundwater around the Oak Ridge Reservation. Since so many of the contaminants in Oak Ridge are long lived (e.g., <sup>238</sup>U with a live time of 5 - 7 half lives - would last something like 3 - 4 times the current estimate of the age of the universe. Remember uranium is highly mobile as previously stated. The immobility of uranium in the groundwater system as has been parroted by DOE and its contractors is demonstrable nonsense (see Gascoyne, 1993; Osmond and Cowart, 1976, 1993).

So, to the rivers and whether they are barriers to groundwater flow. The nature of the rivers in Appalachia are such that they are meandering. The way that rivers can meander is that they spend a lot of geological time flowing on a geologically old and stable plain.

The nature of east Tennessee and much of Appalachia is that the meandering rivers are now in gorges in the oldest geologically (deepest stratigraphically) Lower Paleozoic rocks. How did they get there? The

simplest explanation is that they formed on a plain of sediments that were eroded away but remained here long enough to let the rivers form meanders.

Recent work at the Gray Fossil Site, Gray Tennessee, shows a 30 m (100 ft) sequence of sediments, which are 5.5 Ma (million years before the present) at the top and ~55 Ma at the bottom (Zabooa et al., 2011). The upper part of this sequence (same age, ~5.5 - 6 Ma) (Anthony and Grainger, 2001) is present in a now dry cave passage in Big Bone Cave near Murfreesboro, Tennessee. Work by a colleague from the USGS (Daniel Doctor, personal communication) suggests that the same sediments (youngest - 5.5 - 6 Ma) maybe also be in place in a cave excavated into by a quarry in SW Virginia. These distal sites might be enough to describe and explain the nature of the sediment blanket and explain the meanders in the SE USA.

The sediment blanket is no longer present, all the sediments from 5.5 to 55 Ma have all been eroded away and the rivers are now flowing through channels cut in the remaining bedrock. There are explanations for this that geologically that begin with a massive removal of sediments from the area beginning ~ 17 Ma. This is more than adequately documented by drilling records from the floor of the Atlantic Ocean offshore of the Eastern Seaboard of the US and the floor of the Gulf of Mexico (also southeast of the US). Biswal and Hatcher (2019) document (using detrital zircons) that sediments along the US Gulf Coast originate in Appalachia. Poag and Sevon (1998) have written about the dump of sediments into the Atlantic beginning ~ 17 Ma. Other workers suggest some of these sediments remain trapped in small quantities in some high valleys in the Appalachian high country, but they were, except where trapped in caves and sinkholes eroded.

So, what this means is that the Garven et al., (1990) concept shows that a flow system deep in the mid-continent driven by meteoric recharge via the Appalachian began in mid-late Paleozoic. This is known from the Pb-Zinc mining information and has been confirmed to be the case in the more recent deep drilling records mentioned previously. Thus the rivers would not be related to the groundwater flow paths which would be deep and much older geologically. Whatever confusion maybe solely related to the effect of the dams on the river, the use of only monitoring wells and the limited sampling of groundwater - regardless of what the regulations say should be done.

Unless a rigorous amount of additional work is done DOE and its contractors will not get a grasp of the system as a whole. This means that the risk to offsite users and potential future users is significant and probable. One wonders what will happen far into the future when the radionuclides are just as dangerous as now and daughter products that have comparable mobility and greater radioactivity will be produced.

**Response: The U.S. Department of Energy (DOE) thanks you for your participation in the public comment process. The Environmental Management Disposal Facility (EMDF) will be a permanent Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) waste disposal facility designed to the highest engineering standards to be protective**

of human health and the environment for waste that is generated from Oak Ridge National Priorities List (NPL) Site activities. The waste disposed in EMDF will primarily be soil and debris associated with the cleanup of the Y-12 National Security Complex and Oak Ridge National Laboratory that will meet the limits as documented in this Record of Decision (ROD). The efficient remediation of the Oak Ridge NPL Site will eliminate the risks associated with contaminated soil and facilities in their current configuration and will consolidate that waste into an engineered facility that can be monitored and maintained. The remedy and selected site meet the CERCLA threshold criteria of protecting human health and the environment and meeting regulatory requirements.

DOE commends the author in compiling the history of how groundwater flow was investigated. However, to clarify, the location where the disposal cells will be located was specifically selected to avoid the karst features described in this comment.

This EMDF location was selected based on the extensive data set available in Bear Creek Valley (BCV) that was used to support conclusions in the Remedial Investigation/Feasibility Study (RI/FS). During preparation of the Proposed Plan, DOE began more site-specific characterization efforts. The additional site characterization evaluated geologic and hydrogeologic conditions specifically at the selected EMDF location and included the referenced eight well pairs (16 wells). These piezometers have been monitored since installation and the monitoring results were evaluated with results from other existing wells in BCV to supplement the general understanding of the site. These monitoring results were used to support identification of a preferred location in the Proposed Plan and the selection of the location in this ROD. Analysis of the data confirmed DOE's understanding of the site, including the conditions that support flow from Pine Ridge towards Bear Creek, with an additional component of flow towards the tributaries and along strike. These are consistent with flow in porous media.

As noted, the contaminant plumes present in BCV from legacy waste management sites demonstrate flow towards Bear Creek, then along Bear Creek as a result of the underlying karst features. As noted earlier, the EMDF was specifically located in an area without such features.

# **What the public should know about on-site radioactive and hazardous waste disposal before the next landfill is built on the Department of Energy Oak Ridge Reservation**

**The Environmental Management Waste Management Facility (EMWMF), the active landfill for radioactive and hazardous waste disposal on the Oak Ridge Reservation**

**How and why did things go wrong at the EMWMF?**  
**How can mistakes be avoided at a future radioactive and hazardous waste landfill on the Oak Ridge Reservation?**

**Historically, DOE disposed of waste in Oak Ridge under the authority of the Atomic Energy Act with minimal attention to environmental releases.**

Radioactive waste in vaults in the Interim Waste Management Facility in Melton Valley near highway 95 in the late 1990s

**In the 1980s and 1990s, DOE Orders and guidance led to efforts to isolate waste from the environment, but resulted in increased disposal cost**

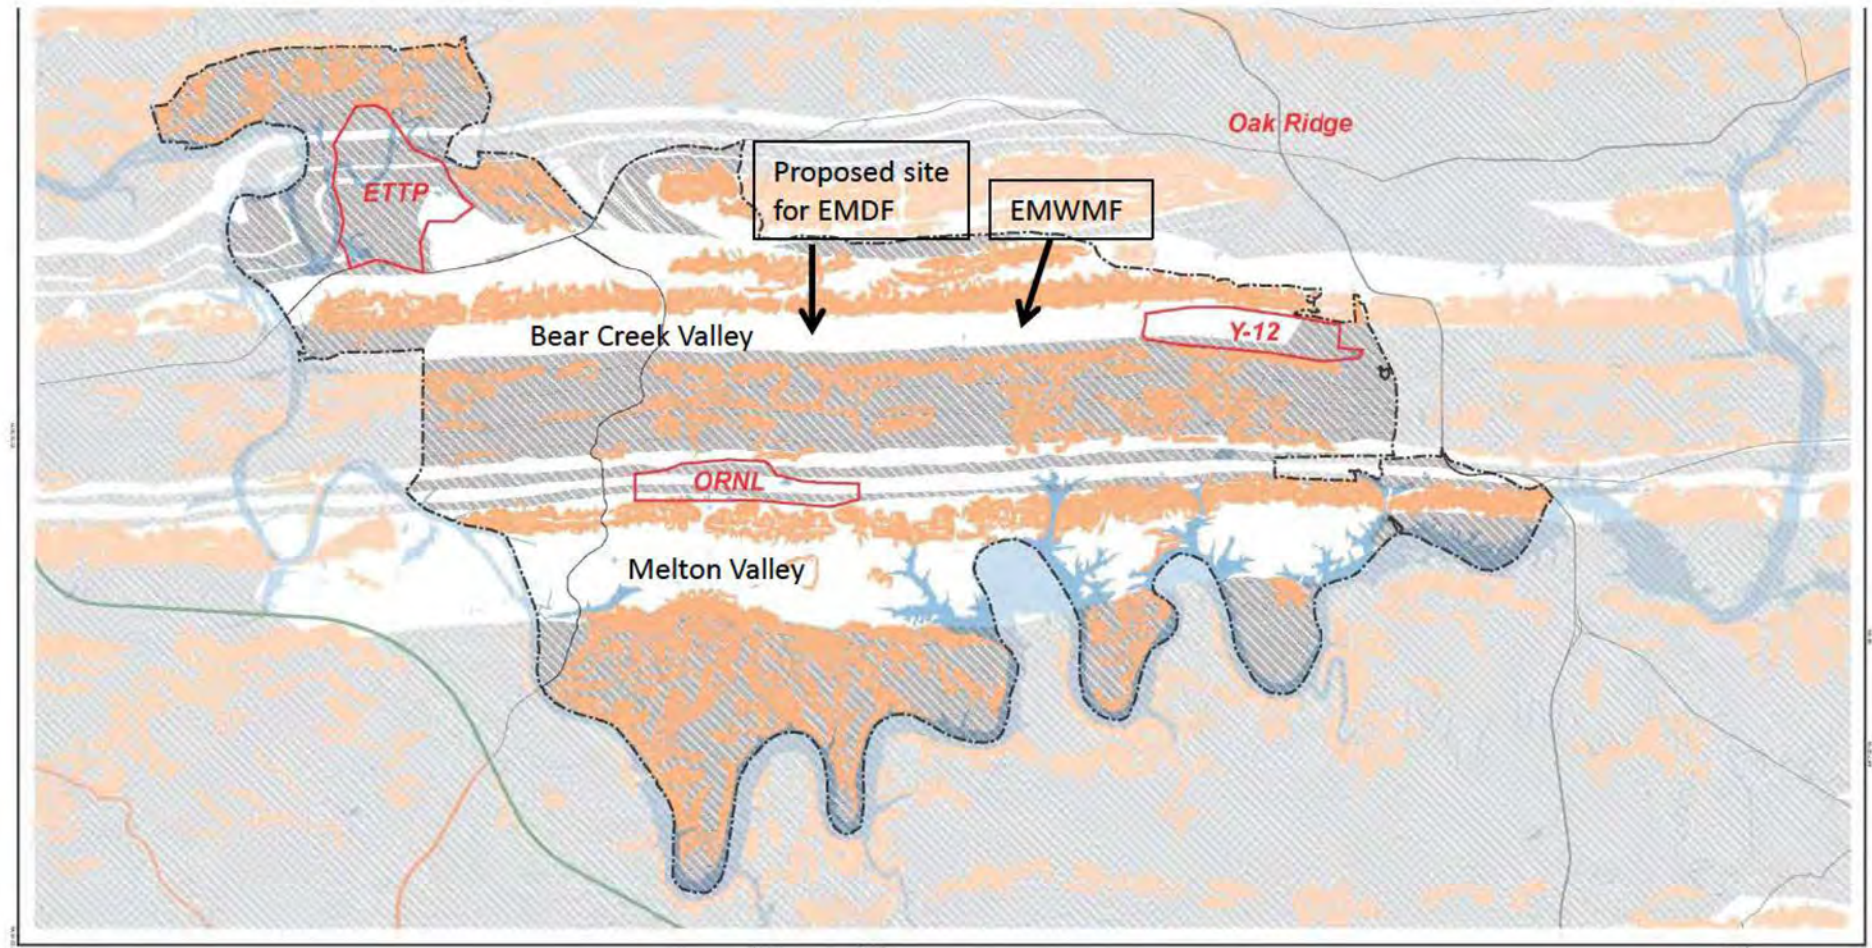

Demolition and remediation waste landfilled in 2002 at the Environmental Management Waste Management Facility (EMWMF)

Waste dumped into trenches in Bear Creek Valley prior to DOE establishing requirements for disposal

Radioactive waste generated from plant operations is now shipped off site for disposal, but large volumes of waste generated by cleanup activities in Oak Ridge have been buried on site. Disposal of radioactive and hazardous waste was authorized through an agreement between DOE, EPA, and the State of Tennessee.

ORNL studies as far back as the 1980s identified areas with steep slopes (orange) and areas of carbonate rocks that can develop caves and other karst features (hatched in gray) as poor candidates for radioactive waste disposal. Even the areas that are less problematic for waste disposal (shown in white) have high water tables, many small streams, and are close to roads and property boundaries. Large quantities of radioactive waste were buried in some areas. Wastes disposed in Melton Valley contain millions of Curies of radioactivity. Millions of pounds of uranium are buried near the current disposal facility (EMWMF) in Bear Creek Valley.

Preliminary Geologic Map of the Oak Ridge, Tennessee Area

**Radioactive, hazardous, and toxic waste generated by demolition and remediation activities is currently disposed on site at the Environmental Management Waste Management Facility (EMWMF) in Bear Creek Valley. DOE sometimes refers to the EMWMF as a permitted landfill. This may be misleading. Although the EMWMF was authorized by agreement with regulatory agencies, it does not operate under a State or EPA permit for waste disposal. Instead, the authorization is implemented through the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), also known as Superfund, and associated laws and rules. These regulations deal with environmental cleanup rather than waste disposal. When the EMWMF was legally authorized, it was through a CERCLA Record of Decision (ROD) rather than a permit.**

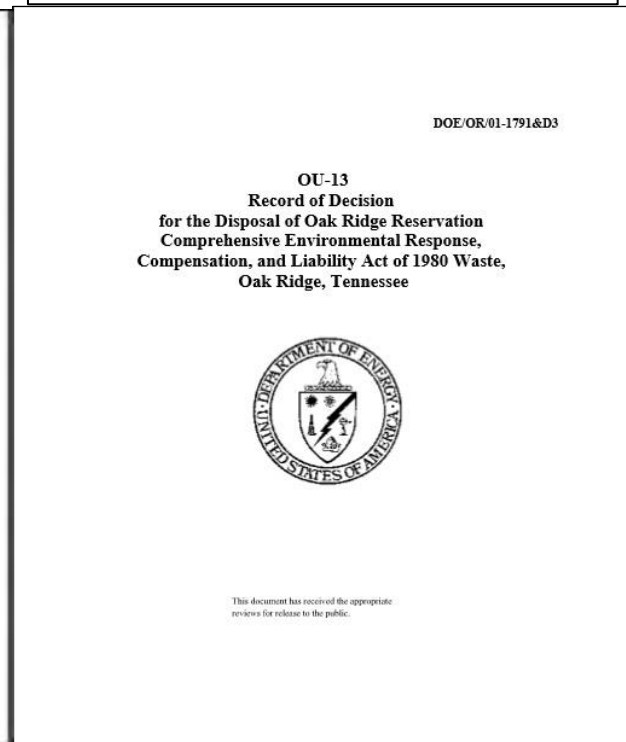

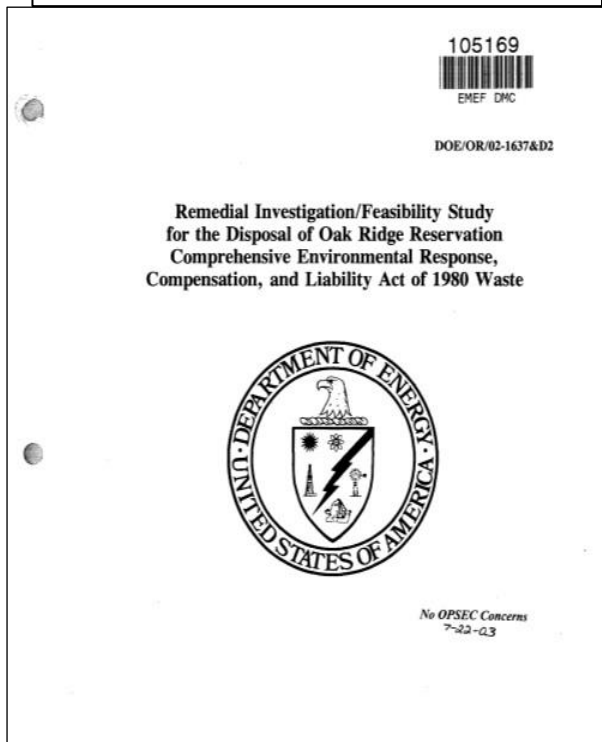

To obtain an actual permit for EMWFMF, it would have been necessary to submit a permit application to a regulatory agency that could license the facility. The permit application would have provided information on the characteristics of the waste to be disposed, a detailed characterization of the site, and plans for facility design and closure. The CERCLA documents that should have provided most of the information normally in a permit application are the Remedial Investigation (typically used to report contaminant nature and extent and exposure pathways at a contaminated site) and the Feasibility Study (typically the basis for choosing a cleanup method).

**Remedial Investigation Feasibility Study (RI/FS) - evaluates disposal options**

**Proposed Plan - summarizes the RI/FS information and identifies the preferred option**

**Record of Decision - presents and describes the alternative chosen by DOE, EPA, and State**

**CERCLA provides a logical framework for evaluating environmental cleanup but must be adapted when used to authorize waste disposal. The EMWMF ROD was approved before some critical information was available, perhaps because the CERCLA process is not designed for approving a disposal facility. Because regulatory decisions were based on limited information, significant problems arose at EMWMF. Some of these problems have persisted. The most significant include:**

- Inadequate information was collected about site hydrogeology before deciding the landfill location, size, layout and design. This has led to groundwater intrusion into the facility buffer and liner.**
- The need to treat large quantities of landfill wastewater was not anticipated, and requirements for wastewater treatment were not included in the ROD. Adequate facilities to manage wastewater were not built at EMWMF.**
- EMWMF risks were evaluated assuming a restricted set of exposure pathways. Contaminant fate and transport modeling in the risk assessment was flawed. As a result, the landfill does not have reasonable limits on the inventory of some radionuclides.**

While Melton Valley and Bear Creek Valley have been considered to be the least problematic locations for radioactive waste disposal on the Oak Ridge Reservation, these areas have high water tables and areas of groundwater discharge that restrict their use for shallow disposal of radioactive waste. The EMWMF site was not studied enough to identify areas where groundwater is near the ground surface. The landfill was designed as if there was no shallow water table. As a result the facility footprint was moved uphill from its planned location, and a drain was built under the facility to suppress groundwater levels. Prior to construction of the EMWMF underdrain, modeling suggested that groundwater was in the clay liner beneath the disposal facility. Groundwater levels under some areas of the landfill remain uncertain, and some data indicate that the levels may remain in the buffer below the landfill liner.

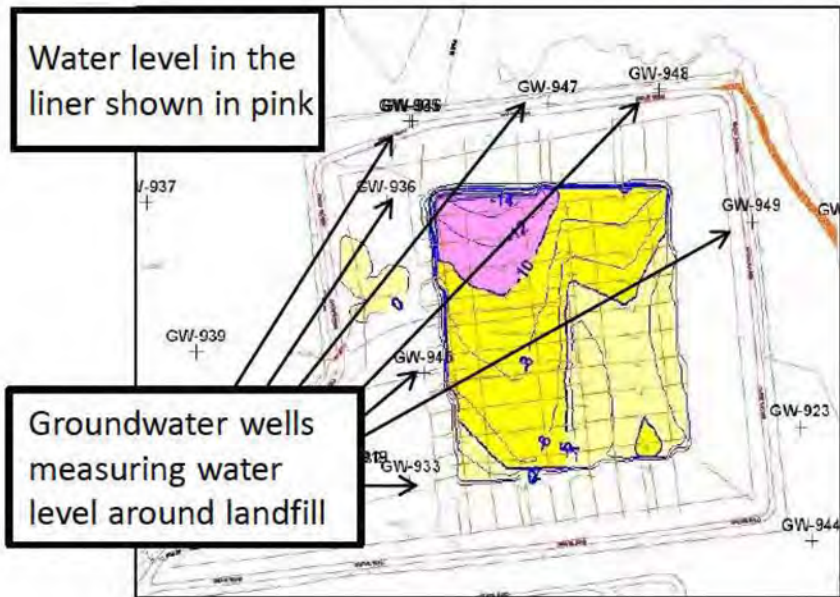

Fig. 9. Modeled hydrogeologic conditions prior to placement of the underdrain.

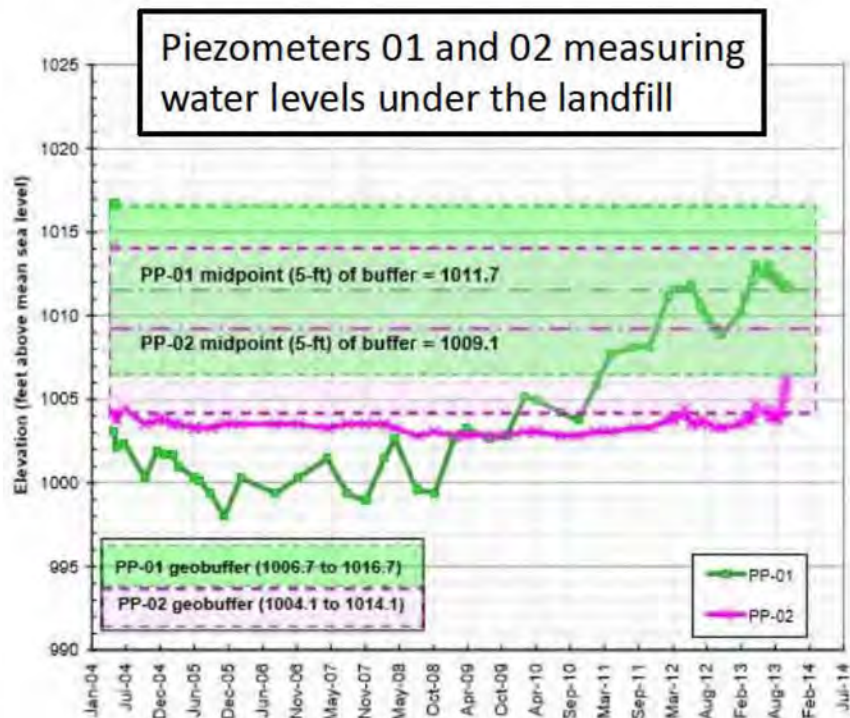

Fig. 6. Groundwater elevations over time for PP-01 and PP-02.

**The EMWMF was approved and constructed without adequate planning for wastewater management. In 2002, excessive generation of leachate and contaminated stormwater led to the flooding of Cell 1 and washout of the berm separating Cells 1 and 2. Wastewater pooled in Cell 2 and was directly released to the environment when it ran through a berm around the cell. The landfill operator was ultimately fined for this release, but the ROD that authorized the EMWMF has still not been modified to reflect the current practices of wastewater management at the facility.**

**The risk assessment for the EMWMF led to some absurd conclusions. Most hazardous chemicals and radionuclides present at Oak Ridge were alleged to never pose a significant risk, even if they were buried in the landfill without any limits on concentration or radioactivity. According to the risk analysis, waste acceptance limits were not necessary for waste contaminated with mercury, most fission products, and many transuranic radionuclides.**

**This analysis could not pass a reality check. DOE, EPA, and the State negotiated administrative limits. But even these limits allowed disposal of billions of Curies of fission products, comparable to the inventory of fission products proposed for the geologic repository for spent nuclear reactor fuel at Yucca Mountain. The administrative waste acceptance criteria (WAC) at EMWMF aren't based on a CERCLA site specific risk assessment and still don't make sense.**

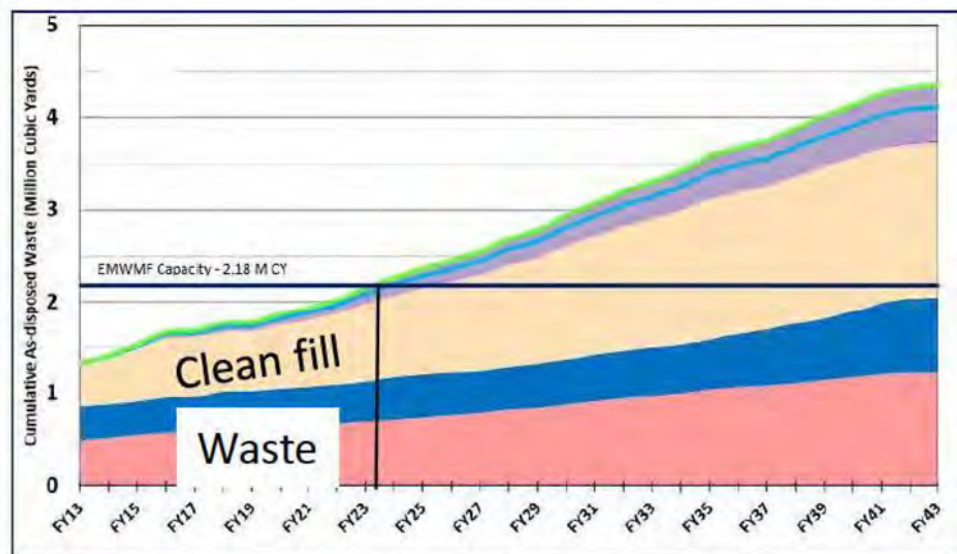

The failure to develop waste acceptance criteria (WAC) that would clearly protect human health and the environment and the failure to rigorously enforce the EMWFM WAC led to a number of problems, especially during the early years of operation. Examples include:

- Liquid radioactive waste was not properly solidified and leaked onto a public highway during transport to EMWFM.
- High activity waste was apparently buried in EMWFM in Waste Lot 84.4. This should have been disposed in a geologic repository like the one that was proposed at Yucca Mountain.
- Waivers of size requirements led to excessive use of clean soil to fill around large pieces of structural steel, wasting landfill capacity

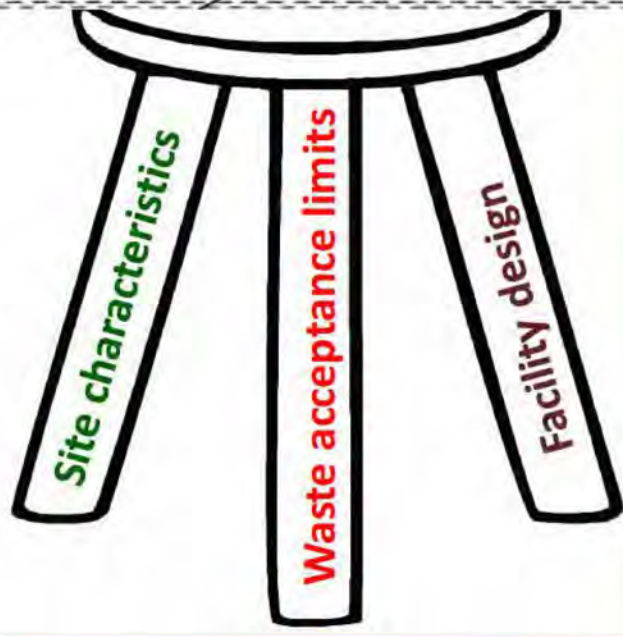

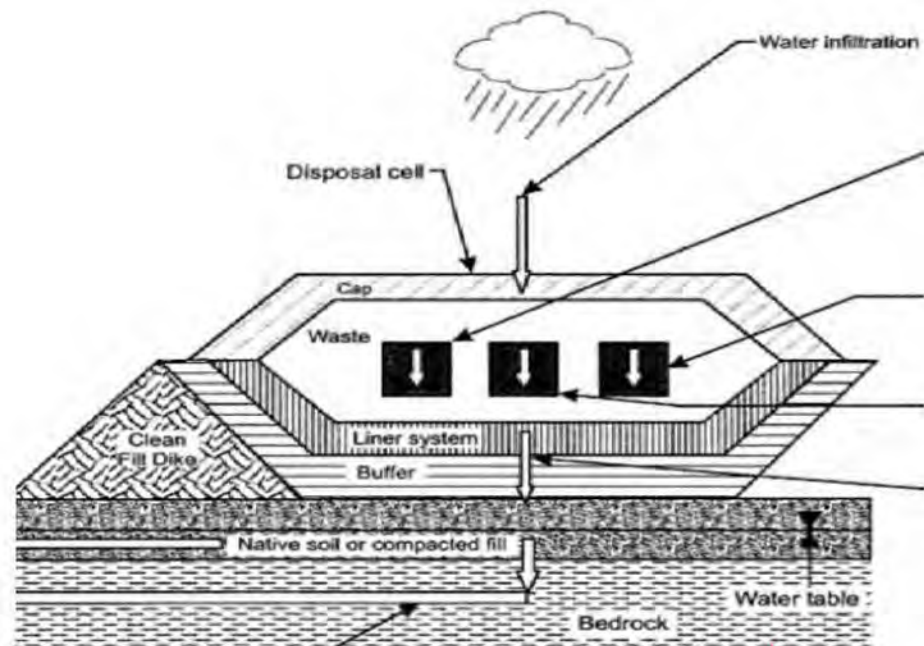

Radiation survey on Hwy. 95 after liquid waste leaked during transit (DOE/ORO-2183, Type B Accident Investigation Board Report).

Burial of large steel beams from the gaseous diffusion buildings such as K-33 without size reduction to meet the EMWFM physical WAC led to the need for excessive use of clean fill and loss of landfill capacity

## Protection of human health and the environment from buried radioactive and hazardous waste depends primarily on:

- **Ability of the site to isolate contaminants from the environment**

A site with desirable geologic and hydrologic characteristics can minimize the potential for a significant release indefinitely.

- **Waste limits**

Limits on the amount of radioactive and hazardous material that can be disposed in the landfill will mitigate the effects of any release to the environment or any exposure of humans to contamination over both short and long timeframes.

- **Ability of engineered barriers to isolate contaminants from the environment**

These barriers have proven to be quite effective for time scales of decades, but they may not be effective for longer periods.

The Oak Ridge Reservation does not provide good sites for radioactive waste disposal due to geologic, hydrologic, and demographic characteristics.

Protection of human health and the environment from wastes buried in Oak Ridge must rely on a robust facility design, adequate quality control during construction, careful operation of the landfill, and restrictions on the waste inventory.

**At EMWMF, the facility design was compromised by inadequate site characterization. The facility was consequently built over, rather than around, areas with streams and shallow groundwater. Waste acceptance criteria were compromised due to limited evaluation of potential exposure pathways and inaccurate assumptions in the contaminant migration models that were fundamental to assessing the potential risks posed by the facility.**

**A CERCLA remedy selected to remediate contaminated sites is required to meet, at a minimum, two threshold criteria:**

- Protect human health and the environment**
- Comply with applicable or relevant and appropriate regulations**

**Did the “remedy” that became EMWMF meet these criteria?**

**NO.** For example, the landfill was built over an area of groundwater discharge, prohibited by rules for siting a radioactive waste disposal facility that are listed in the EMWMF Record of Decision.

**Will it nevertheless protect human health and the environment?**

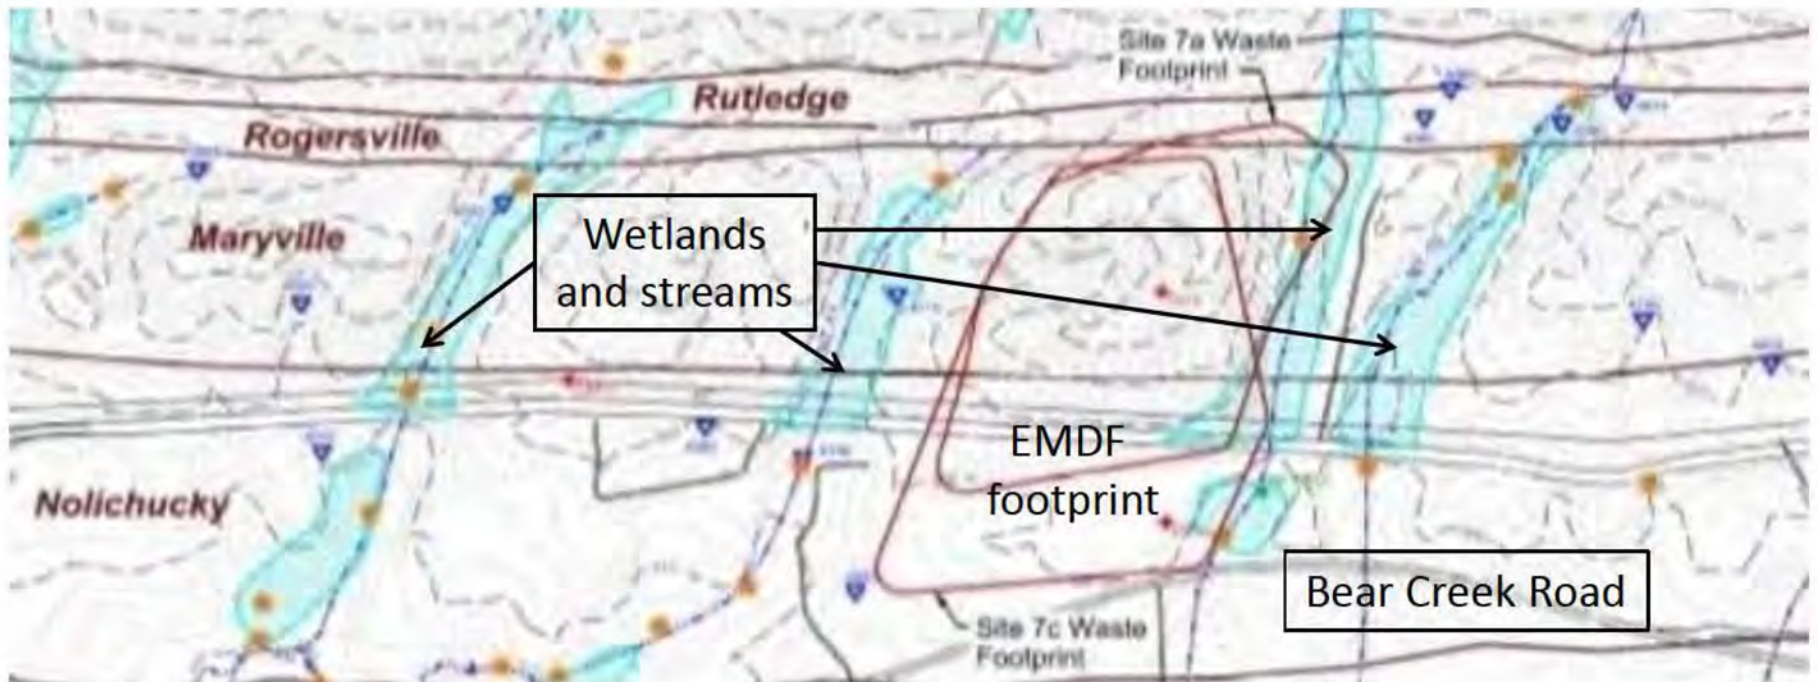

**Maybe.** People will find out sometime in the future.

**But any new radioactive and hazardous waste disposal facility on the Oak Ridge Reservation should not repeat the same mistakes!**

**DOE now plans to build another radioactive and hazardous waste landfill in Bear Creek Valley, the Environment Management Disposal Facility (EMDF), and is asking for regulatory approval:**

- **Without adequate site characterization to avoid areas where groundwater might intrude into the landfill buffer or liner**
- **Without waste acceptance limits based on a defensible risk assessment**
- **Without resolution of wastewater treatment issues**
- **Using cost savings that presume maximum economy of scale for on-site disposal as justification, despite uncertainties about the facility footprint and waste acceptance limits that may be driven by CERCLA requirements to protect human health and the environment and limit the landfill capacity**

## How might the same mistakes be avoided?

More prescriptive rules and guidance from programs that are meant to regulate disposal of radioactive and hazardous waste should be incorporated into the CERCLA decision process.

Credible limits on the amount and concentration of hazardous chemicals and radionuclides that can be disposed in a landfill in Oak Ridge must be established and used to determine the volume of waste that should be buried on-site.

Before an alternative is chosen for on-site disposal, the site to be used for the landfill and the waste to be disposed should be characterized well enough to ensure it can be designed to protect human health and the environment.

An aerial photograph of an industrial facility, likely a waste management or manufacturing plant. The site features several large, dark-roofed buildings, parking lots, and a large, open area of brown earth, possibly a landfill or construction site. The facility is surrounded by green trees and rolling hills. A road or path winds through the landscape.

**Otherwise, the problem of contamination has not been solved, just moved to another place and time.**

  - 5.) Letter from Laura O. Wilkerson to John A. Owsley, "Audit of Waste Lot 84.4: Findings and Required Actions," dated October 26, 2011.

The Tennessee Department of Environment and Conservation (TDEC) has received the Department of Energy (DOE) letter dated October 26, 2011. Based on as thorough review as possible given the available data, TDEC has made the following determinations:

1. TDEC does not contest the DOE assertion that the strategy used for characterization of Waste Lot 84.4 yields, on average, was a conservative assessment of the radionuclide inventories that contribute toward administrative waste acceptance limits at the Environmental Management Waste Management Facility (EMWMF). TDEC accepts DOE's position that a further recalculation of the sum-of-fractions is not necessary for Waste Lot 84.4.
2. In order to maintain an interpretation consistent with State of Tennessee (Rule 1200-02-11-.17-(6)), Nuclear Regulatory Commission (NRC) and DOE Order (DOE N 435.1) requirements,

radionuclide concentrations must be on a container basis for purposes of definition of wastes as TRU or GTCC. Containers should be sampled individually in cases such as Waste Lot 84.4, where much variability in TRU or GTCC radionuclide concentrations is indicated. In general, characterization should be adequate to assert with 95% confidence that no individual container will exceed TRU or GTCC limits. Since the audit of Waste Lot 84.4, the requirements of the administrative WAC for TRU and GTCC wastes have been interpreted on a container basis, and there has been increased diligence on the part of WAC attainment personnel to assure that no containers of potentially TRU or GTCC waste have been disposed. The incorporation of the following statement into EMWMF WAC Attainment Team Project Execution Plan will address this requirement. "Projects are admonished that the Tennessee waste classification is applied on a container-by-container basis. In instances where Class C waste is expected to be generated, profiles are required to discuss which portions of the waste lot are expected to be Class C waste, and the anomaly detection plan in Appendix A is required to discuss the specific methods that will be used to ensure no individual containers are greater than Class C wastes."

3. In the past, TDEC has expressed a desire to have the WAC attainment team contracted independently by DOE. In lieu of an independent WAC attainment team, TDEC will now require that the WAC Attainment Team participate in the DQO session(s) leading up to the creation of the Sampling and Analysis Plan (SAP) that becomes part of the WHP, as well as approve the DQOs that are developed for the SAP, and approve the subsequent SAP. These plans (in whole or in part) may be included in waste profiles as part of their CERCLA and other documentation. Regardless, waste profiles must provide sufficient information to independently evaluate any results generated or conclusions drawn regarding compliance with WAC attainment requirements. Although WHP sampling requirements should be viewed as necessary characterization requirements, these data may still be insufficient. Should data gaps be discovered either as a result of unexpected sample results or incomplete DQOs within the WHP (e.g., due to discovering new process knowledge), additional data will be required to meet the EMWMF DQOs.

The available evidence for evaluation to support these determinations includes:

- **1999 Soil Boring Data**

The 1999 data from twelve IT soil borings that were distributed over the entire Tank W1-A excavation area. These data were submitted by letter to TDEC in 2002. They do not provide complete isotopic analysis and show some inconsistencies, but do reliably indicate that soils in the southern and eastern parts of the excavation area were not contaminated at levels approaching TRU or GTCC limits. They also provide evidence that the upper few feet of soil were generally much cleaner than soils 8-12 feet below ground surface. Soils from these cleaner regions of the excavation were primarily shipped off-site for disposal (~700 cubic yards) and as waste lot 84.3 (about 200 cubic yards), but some of these data may give an indication of the contents of some of the containers shipped as waste lot 84.4. Samples were taken from three borings that were within the excavated area but near the southern and eastern boundaries of the remaining material and Tank W1-A. Analytical data indicate that TRU limits were not reached at any depth in these borings, although some samples south of the tank had TRU constituents that exceeded 50 nCi/g.

- **1998 Soil Boring Data**

Three samples from borings in 1998, including one composited from the top five feet of soil from two borings, another from five feet to refusal of these borings, and one from a discrete location about 12 feet below ground surface in the southernmost borehole. The discrete location was identified as having the highest surface radiological readings, but had lower analytical results for TRU constituents than the composite samples. The southernmost boring was also relatively close to the excavation boundary, and the data indicate the soil was neither TRU nor GTCC. These data were taken from the 1998 EECA for the Core Hole 8 Plume Source.

- **2006 Soil Boring Data**

In 2006, 33 borings in the soils that remained after the excavation were collected. Of 53 total samples that were analyzed adequately to allow the TRU or GTCC contents to be assessed, 18 samples were taken from soils that lay between the tank and the surface of the excavation. The other samples were north and west of the tank. Analytical data indicated that four to six of the 18 samples (TW1A-SB23-A-01, TW1A-SB25-A-01, TW1A-SB35-A-01, TW1A-SB36-A-01, TW1A-SB44-A-01, and TW1A-SB46-B-01) should be classified as TRU, depending on whether alpha or gamma was used to quantify Americium 241. Likewise, 10 to 13 of the total 53 samples would exceed TRU limits. These data were provided by the Waste Acceptance Criteria (WAC) attainment team on request and locations were determined using the Oak Ridge Environmental Information System (OREIS) database. They were used by DOE to establish WAC attainment at Nevada National Security Site (NNSS) for the remaining soils at Tank W1-A, now being removed. Similarly, a ratio of Americium to total TRU constituents was used provide evidence of conservatism in the Waste Lot 84.4 estimate of the TRU and GTCC contents of nine shielded boxes that were disposed in EMWMF. The correlation between either Cesium 137 or Americium 241 and the plutonium isotopes in this data set is too poor, however, to provide much confidence that no box contained TRU or GTCC material. In addition, many of these samples came from north and west of the tank, some distance from the presumed source of soils that were disposed in EMWMF. While this is by far the largest usable data set available from the Tank W1-A area, it is probably not an ideal set with which to evaluate soils in lot 84.4.

- **2002 Grab Sample Data**

In 2002, grab samples were obtained during excavation of "soils near the tank". While the precise location of these samples is not available in any documents TDCE has reviewed, the 2002 Removal Action Report states they came from Quadrant 1 of the excavation area, and the samples are likely to have been taken near the final boundary of the pit. Results from gamma spectroscopy on 31 samples and alpha spectroscopy on 9 samples were included in the waste profile for Waste Lot 84.4. Eight of the nine samples exceeded TRU limits. Containers of soil that yielded these samples were not sent to EMWMF, but other B12 boxes that exhibited less surface radiation were shipped in Waste Lot 84.4. Attempts were made to use scaling factors to estimate the radionuclide inventory of individual containers based on Cesium 137 results. Only Americium 241 and Cesium 137 results were available for soils representative of individual boxes that were shipped in the waste lot. Unfortunately, Cesium 137 correlated negatively with plutonium isotopes, the main contributors, with Americium 241, to TRU or GTCC in all samples. Using just these data and establishing a very weak linear correlation between plutonium isotopes and Americium 241, TDEC would infer that soils representative of Box BR-03S were TRU. Due to the spatial variability of Plutonium, and to a lesser degree, Americium, TDEC does not, however, propose that this set of soil samples is an adequate surrogate data set for soils actually shipped in Waste Lot 84.4. Nor does TDEC claim any validity for a statistical approach based on

Wilkerson Letter

April 3, 2012

these data that might be applied to predicting the contents of a given waste container in Waste Lot 84.4 such as BR-03S.

TDEC has attempted some statistical analyses of these data sets, individually and in combinations, and can only conclude that TRU concentrations in samples near the source area for Waste Lot 84.4 are highly variable. Looking at the approximately 30 samples (18 from 2006 soil borings, 1 from the older data set, and 12 from the 1999 borings) taken near the excavation boundary for which there are sufficient data to infer TRU content, it would appear that a composite of these samples would be neither TRU nor GTCC. There, are however, several analyses that indicate TRU and GTCC adjacent to excavated soils, and DOE has yet to present convincing evidence that the contents of every container in Waste Lot 84.4 was indeed low-level waste.

TDEC accepts that there may be other mitigating factors which reduce the chances that a TRU or GTCC container was disposed. In all probability, many of the B12 boxes that may have contained TRU soils were placed in storage and never shipped to EMWME. Few samples showed TRU content greater than 200 nCi/g. If the contents of one or more containers were TRU, then if the gross weight of the container (including shielding in some cases) is used this might reduce the overall concentration of a waste package below TRU or GTCC limits. In addition, blending of cleaner soils from the top of the soil column with more contaminated soils below was used for dose reduction during excavation, and reduced the chances of the average concentration in a container exceeding the TRU or GTCC limits. One caveat to add, however, is that the efficacy of these factors depends on the spatial correlation of concentrations of radionuclides that comprise the TRU or GTCC lists with radionuclides responsible for dose as measured in the field. As stated before, these appear to be positively but weakly correlated due to variability in the data.

| Radionuclide emissions                                             | <p>Emissions of radionuclides (other than radon) to the ambient air from DOE facilities shall not exceed those amounts that would cause any member of the public to receive in any year an effective dose equivalent of 10 mrem/year.</p> <p>Radionuclide emission measurements shall be made at all release points which have a potential to discharge radionuclides into the air in quantities which could cause an effective does equivalent in excess of 1 percent of the standard. All radionuclides which could contribute greater than 10 percent of the potential effective dose equivalent for a release point shall be measured.</p>                                                                                                                                                                                                                                                                                                                                                                                                    | Radionuclide emissions from point sources at a DOE facility— <b>applicable</b>                                                   | <p>40 <i>CFR</i> 61.92</p> <p>40 <i>CFR</i> 61.93(b)(4)(i)</p>                                                                                                                                                                                                          |
| Radionuclide releases to the environment                           | <p>Concentrations of radioactive material which may be released to the general environment in groundwater, surface water, air, soil, plants or animals must not result in an annual dose exceeding an equivalent of 25 mrem to the whole body, 75 mrem to the thyroid, and 25 mrem to any other organ of any member of the public.<sup>12</sup>.</p> <p><i>NOTE: This requirement addresses radionuclide releases through all pathways. For the surface water pathway, landfill wastewater discharges must also meet the federal Clean Water Act, Tennessee Water Quality Control Act and other requirements that have been identified as relevant and appropriate to radionuclides in the wastewater discharge pursuant to the Dispute Resolution Decision regarding radiological discharges for landfill wastewater releases to the environment by the EPA Administrator on December 31, 2020. These requirements are listed as action-specific ARARs in Table A.3 under “Operation of an Onsite Landfill Wastewater Treatment System”.</i></p> | Releases of radionuclides into the environment from an active licensed land disposal operation – <b>relevant and appropriate</b> | <p>10 <i>CFR</i> 61.41</p> <p>TDEC 0400-20-11-.16(2)</p>                                                                                                                                                                                                                |
| Radon releases to environment                                      | No source at a DOE facility shall emit more than 20 picocuries per square meter per second (pCi/[m <sup>2</sup> -sec]) (1.9 pCi/[ft <sup>2</sup> -sec]) of radon-222 as an average for the entire source, into the air. This requirement will be part of any Federal Facilities Agreement reached between Environmental Protection Agency and DOE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Radon releases to the environment at a DOE facility— <b>applicable</b>                                                           | 40 <i>CFR</i> 61.192                                                                                                                                                                                                                                                    |
| Instream water quality criteria for release of landfill wastewater | <p>Dissolved oxygen shall not be less than 5.0 mg/L. Substantial or frequent variations in dissolved oxygen levels, including diurnal fluctuations, are undesirable if caused by man-induced conditions. Diurnal fluctuations shall not be substantially different from the fluctuations noted in reference streams in the region. There shall always be sufficient dissolved oxygen present to prevent odors of decomposition and other offensive conditions.</p> <p>The pH value shall not fluctuate more than 1.0 unit over a period of 24 hours and shall not be outside the following ranges: 6.0–9.0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   | Release of wastewater or effluents into surface water— <b>applicable</b> as instream criteria beyond the mixing zone             | <p>TDEC 0400-40-03-.03(3)(a)</p> <p>TDEC 0400-40-03-.03(4)(a)</p> <p>TDEC 0400-40-03-.03(5)(a)</p> <p>TDEC 0400-40-03-.03(6)(a)</p> <p>TDEC 0400-40-03-.03(3)(b)</p> <p>TDEC 0400-40-03-.03(4)(b)</p> <p>TDEC 0400-40-03-.03(5)(b)</p> <p>TDEC 0400-40-03-.03(6)(b)</p> |

<sup>12</sup> NOTE: Under these regulations, concentrations of radioactive material that may be released to the general environment in groundwater, surface water, air, soil, plants or animals must not result in an annual dose exceeding an equivalent of 25 mrem to the whole body, 75 mrem to the thyroid, and 25 mrem to any other organ of any member of the public with flexibility on apportionment of that dose among exposure pathways.

| <p>Instream water quality criteria for release of landfill wastewater (cont.)</p> | <p>Water shall not contain iron at concentrations that cause toxicity or in such amounts that interfere with habitat due to precipitation or bacteria growth.</p> <p>The concentration and 30-day average concentrations of ammonia shall not exceed the acute criterion and chronic criteria, respectively, calculated using the equations given in TDEC 0400-40-03-.03(3)(j).</p> <p>Water shall not contain nutrients in concentrations that stimulate aquatic plant and/or algae growth to the extent that aquatic habitat is substantially reduced and/or biological integrity fails to meet regional goals or that the public’s recreational uses of the water body or downstream waters are affected. Additionally, for waters classified for fish and aquatic life, the quality of downstream waters shall not be detrimentally affected. Interpretation of this provision may be made using the document Development of Regionally-based Interpretations of Tennessee’s Narrative Nutrient Criterion and/or other scientifically defensible methods.</p> <p>In waters classified for recreation, the concentration of the <i>e. coli</i> group shall not exceed 126 cfu per 100 mL as a geometric mean based on a minimum of 5 samples collected as specified in the regulation. The concentration of <i>e. coli</i> group in any individual sample shall not exceed 941 cfu per 100 mL.</p> <p>Waters shall not be modified through the addition of pollutants or through physical alteration to the extent that diversity and/or productivity of aquatic biota within the receiving waters are substantially decreased or, in the case of wadeable streams, substantially different from conditions in reference streams in the same ecoregion. The parameters associated with this criterion are the aquatic biota measured. These are response variables.</p> <p>Quality of stream habitat shall provide for development of a diverse aquatic community that meets regionally based biological integrity goals. Types of habitat loss include channel and substrate alterations, rock and gravel removal, stream flow changes, silt accumulation, precipitation of metals, and removal of riparian vegetation. For wadeable streams, instream habitat within each sub-ecoregion shall be generally similar to that found at reference streams. However, streams shall not be assessed as impacted by habitat loss if it has been demonstrated that the biological integrity goal has been met.</p> <p>Stream flow shall support fish and aquatic life criteria and recreational use.</p> |              | <p>TDEC 0400-40-03-.03(3)(i)</p> <p>TDEC 0400-40-03-.03(3)(j)</p> <p>TDEC 0400-40-03-.03(3)(k)<br/>TDEC 0400-40-03-.03(4)(h)</p> <p>TDEC 0400-40-03-.03(3)(l)<br/>TDEC 0400-40-03-.03(4)(f)</p> <p>TDEC 0400-40-03-.03(3)(m)</p> <p>TDEC 0400-40-03-.03(3)(n)</p> <p>TDEC 0400-40-03-.03(3)(o)<br/>TDEC 0400-40-03-.03(4)(m)</p> |

| Antidegradation requirements         | <p>Effluent limitations may be required to insure [sic] compliance with the Antidegradation Statement in TDEC 0400-40-03-.06.</p> <p>New or increased discharges that would cause measurable degradation of the parameter that is unavailable shall not be authorized. Nor will discharges be authorized if they cause additional loadings of unavailable parameters that are bioaccumulative or that have criteria below current method detection levels.<sup>14</sup></p> | <p>Point source discharge(s) of pollutants into waters of the U.S.—<b>applicable</b></p> <p>Waters with “unavailable”[as defined in TDEC 0400-40-03-.06(2)] parameters—<b>applicable</b></p> | <p>TDEC 0400-40-05-.10(4)</p> <p>TDEC 0400-40-03-.06(2)(a)</p>    |
| Antidegradation requirements (cont.) | <p>No new or increased water withdrawals that will cause additional measurable degradation of the unavailable parameter shall be authorized.<sup>15</sup></p> <p>Where one or more of the parameters comprising the habitat criterion are unavailable, activities that cause additional degradation of the unavailable parameter or parameters above the level of de minimis shall not be authorized.</p>                                                                   |                                                                                                                                                                                              | <p>TDEC 0400-40-03-.06(2)(b)</p> <p>TDEC 0400-40-03-.06(2)(c)</p> |

ARAR = applicable or relevant and appropriate requirement  
 CFR = Code of Federal Regulations  
 CWA = Clean Water Act of 1972  
 DOE = U.S. Department of Energy

EMDF = Environmental Management Disposal Facility  
 PCB = polychlorinated biphenyl  
 TDEC = Tennessee Department of Environment and Conservation  
 U.S. = United States

<sup>14</sup> Tennessee determines whether a parameter is “unavailable” by referencing its CWA 303(d) list, available online. Based on the most recent (2020) report, Bear Creek is not meeting its designated recreational use for mercury and PCBs in fish, and nitrites/nitrates and cadmium in water. Mercury (in the form of methylmercury) and PCBs bioaccumulate in fish, and the rule allows “no additional loading.” For nitrites/nitrates and cadmium, the requirement is to allow no measurable degradation. This requirement will no longer be an ARAR if conditions improve, such that Bear Creek attains its designated use before EMDF begins discharging wastewater. If the currently “unavailable” parameters become “available” parameters under the rule, the new ARAR would be TDEC 0400-40-03-.06(3).

<sup>15</sup> The remedy does not involve water withdrawal.

**Table A.2. Location-specific applicable or relevant and appropriate requirements for selected alternative**

| Location Resource                                              | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Prerequisite                                                                                          | Citation                                                                                                                                                                                                                    |

| <i>Wetlands</i>                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                       |                                                                                                                                                                                                                             |
| <p>Presence of wetlands as defined in 10 <i>CFR</i> 1022.4</p> | <p>Incorporate wetland protection considerations into its planning, regulatory, and decision-making processes, and, to the extent practicable, minimize the destruction, loss, or degradation of wetlands; and preserve and enhance the natural and beneficial values of wetlands.</p> <p>Undertake a careful evaluation of the potential effects of any proposed wetland action.</p> <p>Avoid, to the extent possible, the long- and short-term adverse impacts associated with the destruction of and occupancy and modification of wetlands. Avoid direct and indirect development in a wetland wherever there is a practicable alternative.</p> <p>Identify, evaluate, and, as appropriate, implement alternative actions that may avoid or mitigate adverse wetland impacts.</p> <p><b>Project Description.</b> This section shall describe the proposed action and shall include a map showing its location with respect to the floodplain and/or wetland. For actions located in a floodplain, the nature and extent of the flood hazard shall be described, including the nature and extent of hazards associated with any high-hazard areas.</p> <p><b>Floodplain or Wetland Impacts.</b> This section shall discuss the positive and negative, direct and indirect, and long- and short-term effects of the proposed action on the floodplain and/or wetland. This section shall include impacts on the natural and beneficial floodplain and wetland values (§ 1022.4) appropriate to the location under evaluation. In addition, the effects of a proposed floodplain action on lives and property shall be evaluated. For an action proposed in a wetland, the effects on the survival, quality, and function of the wetland shall be evaluated.</p> <p><b>Alternatives.</b> Consider alternatives to the proposed action that avoid adverse impacts and incompatible development in a wetland area, including alternate sites, alternate actions, and no action. DOE shall evaluate measures that mitigate the adverse effects of actions in a wetland including, but not limited to, minimum grading requirements, runoff controls, design and construction constraints, and protection of ecologically sensitive areas.</p> <p>If no practicable alternative to locating or conducting the action in the wetland is available, then before taking action design or modify the action in order to minimize potential harm to or within the wetland, consistent with the policies set forth in Executive Order 11990.</p> | <p>DOE actions that involve potential impacts to, or take place within wetlands—<b>applicable</b></p> | <p>10 <i>CFR</i> 1022.3(a)(7) and (8)</p> <p>10 <i>CFR</i> 1022.3(b), (c), (d)</p> <p>10 <i>CFR</i> 1022.13(a)(1)</p> <p>10 <i>CFR</i> 1022.13(a)(2)</p> <p>10 <i>CFR</i> 1022.13(a)(3)</p> <p>10 <i>CFR</i> 1022.14(a)</p> |

**Table A.2. Location-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Location Resource                                                                                                             | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Prerequisite                                                                                                                               | Citation                                                                                                                                                                                         |

| Location Resource                                                       | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Prerequisite | Citation                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>General<br/>Compensatory<br/>Mitigation for<br/>Wetlands (cont.)</p> | <p>All compensatory mitigation projects must comply with the standards in this part [40 <i>CFR</i> Part 230], if they are to be used to provide compensatory mitigation for activities authorized by DA permits, regardless of whether they are sited on public or private lands and whether the sponsor is a governmental or private entity.</p> <p><i>NOTE:</i> Although permits are not required per CERCLA Section 121(e)(1), consultation with the USACE recommended to determine mitigation of any adverse impacts. Such mitigation would be performed as part of the remedial action.</p> <p>Required compensatory mitigation should be located within the same watershed as the impact site and should be located where it is most likely to successfully replace lost functions and services, taking into account such watershed scale features as aquatic habitat diversity, habitat connectivity, relationships to hydrologic sources (including the availability of water rights), trends in land use, ecological benefits, and compatibility with adjacent land uses.</p> <p>Project site must be ecologically suitable for providing the desired aquatic resource functions. In determining the ecological suitability of the compensatory mitigation project site, the district engineer must consider, to the extent practicable, the factors in subsections (i) thru (vi).</p> <p>Applicants should propose compensation sites adjacent to existing aquatic resources or where aquatic resources previously existed.</p> <p>In general, in-kind mitigation is preferable to out-of-kind mitigation because it is most likely to compensate for the functions and services lost at the impact site.</p> <p>Except as provided in paragraph (e)(2) of this section, the required compensatory mitigation shall be of a similar type to the affected aquatic resource.</p> <p>The amount of required compensatory mitigation must be, to the extent practicable, sufficient to replace lost aquatic resource functions. Where appropriate functional or condition assessment methods or other suitable metrics are available, these methods should be used where practicable to determine how much compensatory mitigation is required. If a functional or condition assessment or other suitable metric is not used, a minimum one-to-one acreage or linear foot compensation ratio must be used.</p> <p>Implementation of the compensatory mitigation project shall be, to the maximum extent practicable, in advance of or concurrent with the activity causing the authorized impacts. The district engineer shall require, to the extent appropriate and practicable, additional compensatory mitigation to offset temporal losses of aquatic functions that will result from the permitted activity.</p> |              | <p>40 <i>CFR</i> 230.93 (a)(3)</p><br><p>40 <i>CFR</i> 230.93 (b)<br/><i>Type and location of mitigation</i></p><br><p>40 <i>CFR</i> 230.93 (d)(1) and (3)<br/><i>Site selection</i></p><br><p>40 <i>CFR</i> 230.93 (e)(1)<br/><i>Mitigation type</i></p><br><p>40 <i>CFR</i> 230.93 (f)(1)<br/><i>Amount of compensatory mitigation</i></p><br><p>40 <i>CFR</i> 230.93 (m)<br/><i>Timing</i></p> |

| Compensatory Mitigation Planning              | <p>Prepare a mitigation plan addressing objectives, site selection, site protection, baseline information, determination of credits, mitigation work plan, maintenance plan, performance standards, monitoring requirements, long-term management, and adaptive management.</p> <p><i>NOTE:</i> Plan would be part of CERCLA document, such as a Remedial Action Work Plan. Plan to include items described in 40 <i>CFR</i> 230.94(c)(2) through (c)(14).<sup>17</sup></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Alteration of wetlands requiring compensatory mitigation to replace lost aquatic resource functions – <b>relevant and appropriate</b> | 40 <i>CFR</i> 230.94(c)<br><i>Mitigation Plan</i>                                                                                              |
| Compensatory Mitigation Performance Standards | <p>The approved mitigation plan must contain performance standards that will be used to assess whether the project is achieving its objectives. Performance standards should relate to the objectives of the compensatory mitigation project, so that the project can be objectively evaluated to determine if it is developing into the desired resource type, providing the expected functions, and attaining any other applicable metrics (e.g., acres).</p> <p>Performance standards must be based on attributes that are objective and verifiable. Ecological performance standards must be based on the best available science that can be measured or assessed in a practicable manner.</p> <p>Performance standards may be based on variables or measures of functional capacity described in functional assessment methodologies, measurements of hydrology or other aquatic resource characteristics, and/or comparisons to reference aquatic resources of similar type and landscape position. The use of reference aquatic resources to establish performance standards will help ensure that those performance standards are reasonably achievable, by reflecting the range of variability exhibited by the regional class of aquatic resources as a result of natural processes and anthropogenic disturbances. Performance standards based on measurements of hydrology should take into consideration the hydrologic variability exhibited by reference aquatic resources, especially wetlands.</p> | Alteration of wetlands requiring compensatory mitigation to replace lost aquatic resource functions – <b>relevant and appropriate</b> | 40 <i>CFR</i> 230.95 (a)<br><i>Ecological Performance Standards</i><br><br>40 <i>CFR</i> 230.95 (b)<br><i>Ecological Performance Standards</i> |
| Compensatory Mitigation Project Monitoring    | <p>Monitoring the compensatory mitigation project site is necessary to determine if the project is meeting its performance standards, and to determine if measures are necessary to ensure that the compensatory mitigation project is accomplishing its objectives.</p> <p>Compensatory mitigation project monitoring period shall be sufficient to demonstrate that project has met performance standards, but not less than 5 years.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Alteration of wetlands requiring compensatory mitigation to replace lost aquatic resource functions – <b>relevant and appropriate</b> | 40 <i>CFR</i> 230.96 (a) and (b)<br><i>Monitoring</i>                                                                                          |

<sup>17</sup> If mitigation obligations will be met by securing credits from approved mitigation banks or in-lieu fee programs, mitigation plan need include only items described in Sect. 230.94(c)(5) and (c)(6), and name of mitigation bank or in-lieu fee program. 40 *CFR* 230.94(c)(1).

| <p>Compensatory Mitigation Project Management</p> | <p>The aquatic habitats, riparian areas, buffers, and uplands that comprise the overall compensatory mitigation project must be provided long-term protection through real estate instruments or other available mechanisms, as appropriate.</p> <p>For government property, long-term protection may be provided through federal facility management plans or integrated natural resources management plans.</p> <p><i>NOTE:</i> Plan would be part of CERCLA document, such as a Remedial Action Work Plan and/or Operations and Maintenance Plan.</p> <p>Projects shall be designed, to the maximum extent practicable, to be self-sustaining once performance standards have been achieved.</p> <p>This includes minimization of active engineering features (e.g., pumps) and appropriate siting to ensure that natural hydrology and landscape context will support long-term sustainability. Where active long-term management and maintenance are necessary to ensure long-term sustainability (e.g., prescribed burning, invasive species control, maintenance of water control structures, easement enforcement), the responsible party must provide for such management and maintenance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>Alteration of wetlands on <i>government property</i> requiring compensatory mitigation to replace lost aquatic resource functions – <b>relevant and appropriate</b></p> | <p>40 <i>CFR</i> 230.97 (a)(1)<br/><i>Site Protection</i></p> <p>40 <i>CFR</i> 230.97 (b)<br/><i>Sustainability</i></p>                       |
| <p>Minor alterations to wetlands</p>              | <p>Minor alteration to wetlands must be conducted in accordance with the requirements of the ARAP Program (TDEC 0400-40-07). The substantive general permit requirements for minor alteration to wetlands include the following:</p> <ul style="list-style-type: none"> <li>• Excavation and fill activities associated with wetland alteration shall be kept to a minimum</li> <li>• Wetlands outside of the impact areas shall be clearly marked with signs, high visibility fencing, or similar structures so that all the work performed by the contractor is solely within the permitted impact area.</li> <li>• Wetland alterations shall not cause measureable degradation to resource values and classified uses of hydraulically connected wetlands or other waters of the state, including disruption of sustaining surface or groundwater hydrology.</li> <li>• Temporary impacts to wetlands shall be mitigated by the removal and stockpiling of the first 12 in. of topsoil, prior to construction. Temporary wetland crossings or haul roads shall utilize timber matting. Gravel, riprap or other rock is not approved for construction of temporary crossings or haul roads across wetlands. Upon completion of construction activities, all temporary wetland impact areas are to be restored to pre-construction contours, and the stockpiled topsoil spread to restore these areas to pre-construction elevation. Other side-cast material shall not be placed within the temporary impact locations. Permanent vegetative stabilization using native species of all disturbed areas in or near the wetland must be initiated within 14 days of project completion. Non-native, non-invasive annuals may be used as cover crops until native species can be established.</li> </ul> | <p>Minor alterations of up to 0.10 acre of moderate resource value wetlands or of up to 0.25 acre of degraded and of low resource value wetlands — <b>applicable</b></p>   | <p>TCA 69-3-108(1)<br/>TDEC 0400-40-07-.01<br/>TDEC ARAP General Permit for Minor Alterations to Wetlands (effective April 7, 2020) (TBC)</p> |

**Table A.2. Location-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Location Resource             | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Prerequisite | Citation |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|----------|
| Minor alterations to wetlands | <ul style="list-style-type: none"> <li>• Erosion prevention and sediment control measures such as fences shall be removed following completion of construction.</li> <li>• The amount of fill, stream channel and bank modifications, or other impacts associated with the activity shall be limited to the minimum necessary to accomplish the project purpose. Shall utilize the least impactful practicable method of construction.</li> <li>• Clearing, grubbing, or other disturbance to wetland vegetation shall be kept at the minimum. Unnecessary native vegetation removal, including tree removal, and soil disturbance is prohibited. Native wetland vegetation must be reestablished in all areas of disturbance outside of any permanent structure after work is completed.</li> <li>• Activity may not result in a disruption or barrier to the movement of fish or other aquatic life and wetland dependent species upon project completion.</li> <li>• Blasting within 50 ft of any jurisdictional stream or wetland is prohibited.</li> <li>• Where practicable, all activities shall be accomplished during drier times of the year or when recent conditions have been dry at the impact location. All surface water flowing towards or from the construction activity shall be diverted using cofferdams and/or berms constructed of sandbags, steel sheeting, or other non-erodible, non-toxic material. All such diversion materials shall be located outside the wetland and removed upon completion of the work. Activities may be conducted in the water if working in the dry will likely cause additional degradation. If work is conducted in the water it must be of a short duration and with minimal impact.</li> <li>• All activities must be carried out in such a manner as will prevent violations of water quality criteria or impairment of the designated uses of the waters of the state</li> <li>• Erosion and sedimentation control shall be in place and functional before earthmoving operations begin and shall be designed according to the department’s Erosion and Sediment Control Handbook. Permanent vegetation stabilization using native species of all disturbed areas in or near the stream channel must be initiated within 14 days of the project completion. Non-native, non-invasive annuals may be used as cover crops until native species can be established.</li> <li>• The use of monofilament-type erosion control netting or blanket is prohibited in the stream channel, stream banks, or any disturbed riparian areas within 30 ft of top of bank.</li> </ul> |              |          |

**Table A.2. Location-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Location Resource                                                              | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Prerequisite                                                                                              | Citation                                                                                                                                                                               |

| <i>Floodplains</i>                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                           |                                                                                                                                                                                        |
| <p>Presence of floodplain as defined in 10 <i>CFR</i> 1022.4</p>               | <p>Incorporate floodplain management goals into planning, regulatory, and decision-making processes, and, to the extent practicable, reduce the risk of flood loss; minimize the impact of floods on human safety, health, and welfare; restore and preserve natural and beneficial values served by floodplains; require the construction of DOE structures and facilities to be, at a minimum, in accordance with FEMA National Flood Insurance Program building standards; and promote public awareness of flood hazards by providing conspicuous delineations of past and probable flood heights on DOE property that is in an identified floodplain.</p> <p>Undertake a careful evaluation of the potential effects of any proposed floodplain action. Identify, evaluate, and, as appropriate, implement alternative actions that may avoid or mitigate adverse floodplain impacts.</p> <p>Avoid, to the extent possible, the long- and short-term adverse impacts associated with the occupancy and modification of floodplains. Avoid direct and indirect development in a floodplain wherever there is a practicable alternative.</p> <p>Consider alternatives to the proposed action that avoid adverse impacts and incompatible development in the floodplain, including alternate sites, alternate actions, and no action. DOE shall evaluate measures that mitigate the adverse effects of actions in a floodplain including, but not limited to, minimum grading requirements, runoff controls, design and construction constraints, and protection of ecologically sensitive areas.</p> <p>If no practicable alternative to locating or conducting the action in the floodplain is available, then before taking action design or modify the action in order to minimize potential harm to or within the floodplain, consistent with the policies set forth in Executive Order 11988.</p> | <p>DOE actions that involve potential impacts to, or take place within, floodplains—<b>applicable</b></p> | <p>10 <i>CFR</i> 1022.3(a)(1) through (6)</p> <p>10 <i>CFR</i> 1022.3(b) and (d)</p> <p>10 <i>CFR</i> 1022.3(c)</p> <p>10 <i>CFR</i> 1022.13(a)(3)</p> <p>10 <i>CFR</i> 1022.14(a)</p> |
| <i>Aquatic Resources</i>                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                           |                                                                                                                                                                                        |
| <p>Waters of the state as defined in TCA 69-3-103(45) – Bank stabilization</p> | <p>Bank stabilization activities along state waters must be conducted in accordance with the requirements of the ARAP Program (TDEC 0400-40-07). The substantive general permit requirements for stream bank stabilization include the following:</p> <ul style="list-style-type: none"> <li>• Any spraying, mowing, or other disturbance of the stabilization treatment that interferes with its ability to naturalize is prohibited.</li> <li>• Work performed by vehicles and other related heavy equipment may not be staged within the stream channel. Work performed by hand and related hand-operated equipment is allowed within the stream channel.</li> <li>• Materials used for bank stabilization shall consist of rock, wood, or products made specifically for use in earthen slope stabilization. Other salvaged materials not found in the natural environment cannot be used for bank stabilization.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Bank-stabilization activities affecting waters of the state—<b>applicable</b></p>                      | <p>TCA 69-3-108(1)<br/>TDEC 0400-40-07-.01<br/>TDEC ARAP General Permit for Bank Armoring and Vegetative Stabilization Activities (effective January 6, 2021) (TBC)</p>                |

**Table A.2. Location-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Location Resource                                                                      | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Prerequisite | Citation |
|----------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|----------|
| <p>Waters of the state as defined in TCA 69-3-103(45) – Bank stabilization (cont.)</p> | <ul style="list-style-type: none"> <li>• The amount of fill, stream channel and bank modifications, or other impacts associated with the activity shall be limited to the minimum necessary to accomplish the project purpose. Shall utilize the least impactful practicable method of construction.</li> <li>• Clearing, grubbing, or other disturbance to riparian vegetation shall be kept at the minimum necessary for slope construction and equipment operation. Unnecessary native riparian vegetation removal, including tree removal, is prohibited. Native riparian vegetation must be reestablished in all areas of disturbance outside of any permanent structure after work is completed.</li> <li>• Activity may not result in the permanent disruption to the movement of fish or other aquatic life upon project completion.</li> <li>• Blasting within 50 ft of any jurisdictional stream or wetland is prohibited.</li> <li>• Backfill activities must be accomplished in the least impactful manner possible that stabilizes the streambed and banks to prevent erosion. The completed activities may not disrupt or impound stream flow.</li> <li>• The use of monofilament-type erosion control netting or blanket is prohibited in the stream channel, stream banks, or any disturbed riparian areas within 30 ft of top of bank.</li> <li>• Where practicable, all activities shall be accomplished in the dry. All surface water flowing towards the work shall be diverted using cofferdams and/or berms constructed of sandbags, clean rock (no fines or soils), steel sheeting, or other non-erodible, non-toxic material. All such diversion materials shall be removed upon completion of the work. Any disturbance to the stream bed or banks must be restored to its original condition. Activities may be conducted in the water if working in the dry will likely cause additional degradation. If work is conducted in the water it must be of a short duration and with minimal impact and conform to the Division-approved methodology.</li> <li>• All activities must be carried out in such a manner as will prevent violations of water quality criteria or impairment of the designated uses of the waters of the state</li> <li>• Erosion and sedimentation control shall be in place and functional before earthmoving operations begin and shall be designed according to the department’s Erosion and Sediment Control Handbook. Permanent vegetation stabilization using native species of all disturbed areas in or near the stream channel must be initiated within 14 days of the project completion. Non-native, non-invasive annuals may be used as cover crops until native species can be established.</li> <li>• Temporary stream crossings shall be limited to one point in the construction area and erosion control measures shall be utilized where stream bank vegetation is disturbed. Stream beds shall not be used as linear transportation routes for mechanized equipment, rather, the stream channel may be crossed perpendicularly with equipment provided no additional fill or excavation is necessary.</li> </ul> |              |          |

**Table A.2. Location-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Location Resource                                                                   | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Prerequisite                                                               | Citation                                                                                                                      |

| Waters of the state as defined in TCA 69-3-103(45) – Bank stabilization (cont.)     | <ul style="list-style-type: none"> <li>• Hard armoring bank stabilization treatment shall not exceed 300 linear ft for the treatment of one bank, or 200 linear ft per bank if the treatment includes both banks.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                            |                                                                                                                               |
| Waters of the state as defined in TCA 69-3-103(45) – Culvert maintenance activities | <p>The maintenance of existing serviceable structures or fills along waters of the state must be conducted in accordance with the requirements of the ARAP Program (TDEC 0400-40-07). The substantive general permit requirements for maintenance activities include the following:</p> <ul style="list-style-type: none"> <li>• The length of the pipe or culvert structure may not be increased in a manner that encapsulates any additional length of open stream or wetland</li> <li>• The capacity or diameter of the culvert may be increased during replacement, providing it does not result in channel widening or other channel destabilization</li> <li>• Dewatering of impoundments to conduct dam maintenance must be performed in a controlled manner designed to prevent the release of accumulated sediments into downstream waters.</li> <li>• All riprap associated with maintenance activities shall be placed to mimic the existing contours of the stream channel. Riprap shall be countersunk and placed at grade with the existing stream substrate. Voids in the riprap shall be filled with suitable bedload substrate to prevent stream flow loss within riprap areas. Suitable substrate does not include soil.</li> <li>• Work performed by vehicles and other heavy equipment may not be staged within the stream channel. Work performed by hand and related hand-operated equipment is allowed within the stream channel.</li> <li>• The amount of fill, stream channel and bank modifications, or other impacts associated with the activity shall be limited to the minimum necessary to accomplish the project purpose. Shall utilize the least impactful practicable method of construction.</li> <li>• Clearing, grubbing, or other disturbance to riparian vegetation shall be kept at the minimum necessary for slope construction and equipment operations. Unnecessary native riparian vegetation removal, including tree removal is prohibited. Native riparian vegetation must be reestablished in all areas of disturbance outside of any permanent structure after work is completed.</li> <li>• Widening of the stream channel is prohibited</li> <li>• Activity may not result in a permanent disruption to the movement of fish or other aquatic life upon project completion.</li> <li>• Blasting within 50 ft of any jurisdictional stream or wetland is prohibited.</li> </ul> | Maintenance activities affecting waters of the state—<br><b>applicable</b> | TCA 69-3-108(1)<br>TDEC 0400-40-07-.01<br>TDEC ARAP General Permit for Maintenance Activities (effective April 7, 2020) (TBC) |

**Table A.2. Location-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Location Resource                                                                                  | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Prerequisite                                                           | Citation               |

| <p>Waters of the state as defined in TCA 69-3-103(45) – Culvert maintenance activities (cont.)</p> | <ul style="list-style-type: none"> <li>• Backfill activities must be accomplished in the least impactful manner possible that stabilizes the streambed and banks to prevent erosion. The completed activities may not disrupt or impound stream flow.</li> <li>• The use of monofilament-type erosion control netting or blanket is prohibited in the stream channel, stream banks, or any disturbed riparian areas within 30 ft of top of bank.</li> <li>• Where practicable, all activities shall be accomplished in the dry. All surface water flowing towards the work shall be diverted using cofferdams and/or berms constructed of sandbags, clean rock (no fines or soils), steel sheeting, or other non-erodible, non-toxic material. All such diversion materials shall be removed upon completion of the work. Any disturbance to the stream bed or banks must be restored to its original condition. Activities may be conducted in the flowing water if working in the dry will likely cause additional degradation. If work is conducted in the flowing water it must be of a short duration and with minimal impact and conform to the Division-approved methodology.</li> <li>• All activities must be carried out in such a manner as will prevent violations of water quality criteria or impairment of the designated uses of the waters of the state</li> <li>• Erosion and sedimentation control shall be in place and functional before earthmoving operations begin and shall be designed according to the department’s Erosion and Sediment Control Handbook. Permanent vegetation stabilization using native species of all disturbed areas in or near the stream channel must be initiated within 14 days of the project completion. Non-native, non-invasive annuals may be used as cover crops until native species can be established.</li> <li>• Temporary stream crossings shall be limited to one point in the construction area and erosion control measures shall be utilized where stream bank vegetation is disturbed. Stream beds shall not be used as linear transportation routes for mechanized equipment, rather, the stream channel may be crossed perpendicularly with equipment provided no additional fill or excavation is necessary.</li> </ul> |                                                                        |                        |
| <p>Alteration of a Wet Weather Conveyance</p>                                                      | <p>Wet-weather conveyances may be altered provided the following conditions are met:</p> <ul style="list-style-type: none"> <li>• The activity must not result in the discharge of waste or other substances that may be harmful to humans or wildlife;</li> <li>• Material must not be placed in a location or manner so as to impair surface water flow into or out of any wetland area; and</li> <li>• Sediment shall be prevented from entering other waters of the state:</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Activities that alter wet-weather conveyances—<b>applicable</b></p> | <p>TCA 69-3-108(q)</p> |

|                                                          | Covers must be designed to minimize to the extent practicable water infiltration, to direct percolating or surface water away from the disposed waste and to resist degradation by surface geologic processes and biotic activity.                                                                                                                                                                                                                                                                                                                                              | Design of a LLW disposal facility— <b>relevant and appropriate</b>                                                                           | TDEC 0400-20-11-.17(2)(d)                                  |
|                                                          | Surface features must direct surface water drainage away from disposal units at velocities and gradients which will not result in erosion that will require ongoing active maintenance in the future.                                                                                                                                                                                                                                                                                                                                                                           | Design of a LLW disposal facility— <b>relevant and appropriate</b>                                                                           | TDEC 0400-20-11-.17(2)(e)                                  |
|                                                          | Disposal site must be designed to minimize to the extent practicable the contact of water with waste during storage, the contact of standing water with waste during disposal and the contact of percolating or standing water with wastes after disposal.<br><br>A buffer zone of land must be maintained between any disposal unit and the disposal boundary and beneath the disposed waste. The buffer zone shall be of adequate dimensions to carry out environmental monitoring activities specified in paragraph (4) of this rule and take mitigative measures if needed. | Design of a LLW disposal facility— <b>relevant and appropriate</b><br><br>Design of a LLW disposal facility— <b>relevant and appropriate</b> | TDEC 0400-20-11-.17(2)(f)<br><br>TDEC 0400-20-11-.17(3)(h) |
| <b>Landfill Liner System and Geologic Buffer</b>         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                              |                                                            |
| Liner design requirements for a TSCA landfill            | Synthetic membrane liners shall be used when the hydrologic or geologic conditions at the landfill require such in order to achieve the permeability equivalent to the soils in paragraph (b)(1) of this section. Whenever a synthetic liner is used at a landfill site, special precautions shall be taken to insure [sic] that its integrity is maintained and that it is chemically compatible with PCBs. Adequate soil underlining and cover shall be provided to prevent excessive stress or rupture of the liner. The liner must have a minimum thickness of 30 mil.      | Design of a TSCA chemical waste landfill— <b>applicable</b>                                                                                  | 40 <i>CFR</i> 761.75(b)(2)                                 |
| Liner and leachate collection design for a RCRA landfill | The owner or operator of a landfill unit on which construction commences after January 29, 1992, must install two or more liners and a leachate collection and removal system above and between such liners.                                                                                                                                                                                                                                                                                                                                                                    | Design of a RCRA landfill— <b>applicable</b>                                                                                                 | 40 <i>CFR</i> 264.301(c)<br>TDEC 0400-12-01-.06(14)(b)(3)  |

**Table A.3. Action-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Action                                 | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Prerequisite                                 | Citation                                                           |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|--------------------------------------------------------------------|
| Liner system for RCRA landfill         | <p>(i) The liner system must include:</p> <p>A. A top liner, designed and constructed of materials (e.g., geomembrane) to prevent the migration of hazardous constituents into the liner during active life and the post-closure period; and</p> <p>B. A composite bottom liner, consisting of at least two components. The upper component must be designed and constructed of materials (e.g., a geomembrane) to prevent the migration of hazardous constituents into this component during the active life and post-closure care period. The lower component must be designed and constructed of materials to minimize the migration of hazardous constituents if a breach in the upper component were to occur. The lower component must be constructed of at least 3 ft (91 cm) of compacted soil material with a hydraulic conductivity of no more than <math>1 \times 10^{-7}</math> cm/sec.</p> <p>(ii) Liners must comply with paragraphs (1)(i)(I), (II), and (III) of this section.</p>                                                                           | Design of a RCRA landfill— <b>applicable</b> | 40 <i>CFR</i> 264.301(c)(1)<br>TDEC 0400-12-01-.06(14)(b)(3)(i)(I) |
| Liner for a RCRA landfill              | <p>A liner that is designed, constructed, and installed to prevent any migration of wastes out of the landfill to the adjacent subsurface soil or groundwater or surface water at any time during the active life (including the closure period) of the landfill. The liner must be constructed of materials that prevent wastes from passing into the liner during the active life of the facility. The liner must be:</p> <p>(i) Constructed of materials that have appropriate chemical properties and sufficient strength and thickness to prevent failure due to pressure gradients, physical contact with the waste or leachate to which they are exposed, climatic conditions, or stress from installation or daily operation;</p> <p>(ii) Placed on a foundation or base capable of supporting the liner and resistance to the pressure gradients above and below the liner to prevent failure of the liner due to settlement, compression, or uplift; and</p> <p>(iii) Installed to cover all surrounding earth likely to be in contact with waste or leachate.</p> | Design of a RCRA landfill— <b>applicable</b> | 40 <i>CFR</i> 264.301(a)(1)<br>TDEC 0400-12-01-.06(14)(b)(1)(i)    |
| Leachate collection and removal system | Must be designed, constructed, operated, and maintained to collect and remove leachate from the landfill during the active life and post-closure period and ensure that the leachate depth over the liner does not exceed 30 cm. The leachate collection and removal system must comply with TDEC 0400-12-01-.06(14)(b)(1)(ii)(I) and (II).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Design of a RCRA landfill— <b>applicable</b> | 40 <i>CFR</i> 264.301(c)(2)<br>TDEC 0400-12-01-.06(14)(b)(1)(ii)   |
| Leak detection system                  | The leachate collection and removal system between the liners, and immediately above the bottom composite liner in the case of multiple leachate collection and removal systems, is also a leak detection system. This leak detection system must be capable of detecting, collecting, and removing leaks of hazardous constituents at the earliest practicable time through all areas of the top liner likely to be exposed to waste or leachate during the active life and post-closure care period. The requirements for a leak detection system in this paragraph are satisfied by installation of a system that is, at a minimum:                                                                                                                                                                                                                                                                                                                                                                                                                                       | Design of a RCRA landfill— <b>applicable</b> | 40 <i>CFR</i> 264.301(c)(3)<br>TDEC 0400-12-01-.06(14)(b)(3)(iii)  |

**Table A.3. Action-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Action                                    | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Prerequisite                                                      | Citation                                                                                                                   |

| Leak detection system (cont.)             | <ul style="list-style-type: none"> <li>(i) Constructed with a bottom slope of 1 percent or more;</li> <li>(ii) Constructed of granular drainage materials with a hydraulic conductivity of <math>1 \times 10^{-2}</math> cm/sec or more and a thickness of 12 in. (30.5 cm) or more; or constructed of synthetic or geonet drainage materials with a transmissivity of <math>3 \times 10^{-5}</math> m<sup>2</sup>/sec or more;</li> <li>(iii) Constructed of materials that are chemically resistant to the waste managed in the landfill and the leachate expected to be generated, and of sufficient strength and thickness to prevent collapse under the pressures exerted by overlying wastes, waste cover materials, and equipment used at the landfill;</li> <li>(iv) Designed and operated to minimize clogging during the active life and post-closure care period; and</li> <li>(v) Constructed with sumps and liquid removal methods (e.g., pumps) of sufficient size to collect and remove liquids from the sump and prevent liquids from backing up into the drainage layer. Each unit must have its own sump(s). The design of each sump and removal system must provide a method for measuring and recording the volume of liquids present in sump and of liquids removed.</li> </ul> |                                                                   |                                                                                                                            |
| Leak detection system action leakage rate | <p>(1) The action leakage rate is the maximum design flow rate that the LDS can remove without the fluid head on the bottom liner exceeding 1 ft. The action leakage rate must include an adequate safety margin to allow for uncertainties in the design (e.g., slope, hydraulic conductivity, thickness of drainage material), construction, operation, and location of the LDS, waste and leachate characteristics, likelihood and amounts of other sources of liquids in the LDS, and proposed response actions.</p> <p>(2) To determine if the action leakage rate has been exceeded, the owner or operator must convert the weekly or monthly flow rate from the monitoring data obtained under TDEC 0400-12-01-.06(14)(d)(3) to an average daily flow rate (gallons per acre per day) for each sump.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Design of a RCRA landfill— <b>applicable</b>                      | 40 <i>CFR</i> 264.302<br>TDEC 0400-12-01-.06(14)(c)                                                                        |
| Geologic buffer                           | <p>Underlying the liners shall be a geologic buffer which shall have:</p> <ul style="list-style-type: none"> <li>(i) A maximum hydraulic conductivity of <math>1.0 \times 10^{-5}</math> cm/s and measures at least 10 ft from the bottom of the liner to the seasonal high water table of the uppermost unconfined aquifer or the top of the formation of a confined aquifer or</li> <li>(ii) Have a maximum hydraulic conductivity of <math>1.0 \times 10^{-6}</math> cm/s and measures not less than 5 ft from the bottom of the liner to the seasonal high water table of the uppermost unconfined aquifer or the top of the formation of a confined aquifer or</li> <li>(iii) Other equivalent or superior protection as defined in subpart (ii) of this part.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Design of a solid waste landfill— <b>relevant and appropriate</b> | TDEC 0400-11-01-.04(4)(a)(2)                                                                                               |

| <p>Construction quality assurance</p>                                    | <p>During construction or installation, liners and cover systems must be inspected for uniformity, damage and imperfections (e.g., holes, cracks, thin spots, etc.). Immediately after construction or installation:</p> <ol style="list-style-type: none"> <li>(1) Synthetic liners and covers must be inspected to ensure tight seams and joints and the absence of tears, punctures, or blisters; and</li> <li>(2) Soil-based and admixed liners and covers must be inspected for imperfections including lenses, cracks, channels, root holes, or other structural non-uniformities that may cause an increase in the permeability of the liner or cover.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Construction of a RCRA landfill—<b>applicable</b></p>                                      | <p>40 <i>CFR</i> 264.303(a)<br/>TDEC 0400-12-01-.06(14)(d)(1)</p>                                                                                               |
| <p>Construction of new outfall structure for discharge of wastewater</p> | <p>Construction of intake and outfall structures activities along state waters must be conducted in accordance with the requirements of the ARAP Program (TDEC 0400-40-07). The substantive general permit requirements for stream bank stabilization include the following:</p> <p>Construction, maintenance, repair, rehabilitation or replacement of intake or outfall structures shall be carried out in such a way that work:</p> <ul style="list-style-type: none"> <li>• Shall be located and oriented so as to avoid permanent alteration or damage to the integrity of the stream channel including the opposite stream bank. Alignment of the structure (except for diffusers) should be as parallel to the stream flow as is practicable, with the discharge pointed downstream. Underwater diffusers may be placed perpendicular to stream flow for more complex mixing.</li> <li>• Intake and outfall structures shall be designed to minimize harm and prevent impoundment of normal or base flows.</li> <li>• Velocity dissipation devices shall be placed as needed at discharge locations to provide a non-erosive velocity from the structure</li> <li>• Headwalls, bank stabilization materials, and any other hard armoring associated with the installation of each structure shall be limited to a total of 25 ft along the receiving stream bank.</li> <li>• The amount of fill, stream channel and bank modifications, or other impacts associated with the activity shall be limited to the minimum necessary to accomplish the project purpose. Shall utilize the least impactful practicable method of construction.</li> <li>• Clearing, grubbing, or other disturbance to riparian vegetation shall be kept at the minimum necessary for slope construction and equipment operations. Unnecessary native vegetation removal, including tree removal is prohibited. Native riparian vegetation must be reestablished in all areas of disturbance outside of any permanent structure after work is completed.</li> <li>• Widening of the stream channel is prohibited.</li> <li>• Activity may not result in a permanent disruption to the movement of fish or other aquatic life upon project completion.</li> </ul> | <p>Construction of intake and outfall structures in waters of the state—<b>applicable</b></p> | <p><i>TCA</i> 69-3-108(1)<br/>TDEC 0400-40-07-.01<br/>TDEC General Permit for Construction of Intake and Outfall Structures (effective April 7, 2020) (TBC)</p> |

**Table A.3. Action-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Action                                                                     | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Prerequisite                                                                                                                    | Citation                                                                                                                    |

| Construction of new outfall structure for discharge of wastewater (cont.)  | <ul style="list-style-type: none"> <li>• Blasting within 50 ft of any jurisdictional stream or wetland is prohibited.</li> <li>• Backfill activities must be accomplished in the least impactful manner possible that stabilizes the streambed and banks to prevent erosion. The completed activities may not disrupt or impound stream flow.</li> <li>• The use of monofilament-type erosion control netting or blanket is prohibited in the stream channel, stream banks, or any disturbed riparian areas within 30 ft of top of bank.</li> <li>• Where practicable, all activities shall be accomplished in the dry. All surface water flowing towards the work shall be diverted using cofferdams and/or berms constructed of sandbags, clean rock (containing no fines or soils), steel sheeting, or other non-erodible, non-toxic material. All such diversion materials shall be removed upon completion of the work. Any disturbance to the stream bed or banks must be restored to its original condition. Activities may be conducted in the flowing water if working in the dry will likely cause additional degradation. If work is conducted in the flowing water it must be of a short duration and with minimal impact and conform to the Division-approved methodology.</li> <li>• All activities must be carried out in such a manner as will prevent violations of water quality criteria or impairment of the designated uses of the waters of the state</li> <li>• Erosion and sedimentation control shall be in place and functional before earthmoving operations begin and shall be designed according to the department’s Erosion and Sediment Control Handbook. Permanent vegetation stabilization using native species of all disturbed areas in or near the stream channel must be initiated within 14 days of the project completion. Non-native, non-invasive annuals may be used as cover crops until native species can be established.</li> <li>• Temporary stream crossings shall be limited to one point in the construction area and erosion control measures shall be utilized where stream bank vegetation is disturbed. Stream beds shall not be used as linear transportation routes for mechanized equipment, rather, the stream channel may be crossed perpendicularly with equipment provided no additional fill or excavation is necessary.</li> </ul> |                                                                                                                                 |                                                                                                                             |
| Activities causing stormwater runoff (e.g., clearing, grading, excavation) | <p>Implement good construction management techniques (including sediment and erosion, vegetative controls, and structural controls) in accordance with the substantive requirements of <i>General Permit No. TNR10-0000</i> and <i>TNR05-0000</i>, to ensure stormwater discharge is properly managed and:</p> <ul style="list-style-type: none"> <li>• Does not violate water quality criteria as stated in TDEC 0400-40-03-.03, including, but not limited to, prevention of discharge that cause a condition in which visible solids, bottom deposits, or turbidity impairs the usefulness of waters of the state for any designated uses for that water body by TDEC 0400-40-04;</li> <li>• Does not contain distinctly visible floating scum, oil, or other matter;</li> <li>• Does not cause an objectionable color contrast in the receiving stream; and</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Stormwater discharges associated with construction activities that disturb $\geq 1$ acre total— <b>relevant and appropriate</b> | <i>TCA 69-3-108(1)</i><br>Tennessee General Permit No. TNR10-0000, Sects. 5.3.2 and 5.4.1 (effective October 1, 2016) (TBC) |

| Disposal of TSCA PCB wastes (e.g., from drained electrical equipment)   | Bulk liquids not exceeding 500 ppm PCBs may be disposed of provided such waste is pretreated and/or stabilized (e.g., chemically fixed, evaporated, mixed with dry inert absorbent) to reduce its liquid content or increase its solid content so that a non-flowing consistency is achieved to eliminate the presence of free liquids prior to final disposal. PCB container of liquid PCBs with a concentration between 50 and 500 ppm PCB may be disposed of if each container is surrounded by an amount of inert sorbent material capable of absorbing all of the liquid contents of the container.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Disposal of PCB container with liquid PCB between 50 ppm and 500 ppm into a TSCA chemical waste landfill— <b>applicable</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 40 <i>CFR</i> 761.75(b)(8)(ii)                                                                                                                                                                                                                                         |
| Placement of untreated waste in a land disposal facility                | This part identifies hazardous wastes that are restricted from land disposal and defines those limited circumstances under which an otherwise prohibited waste may continue to be land disposed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Treatment of characteristic hazardous waste— <b>applicable</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 40 <i>CFR</i> 268.1(a)<br>TDEC 0400-12-01-.10(1)(a)(1)                                                                                                                                                                                                                 |
| Disposal of RCRA hazardous waste in a land-based unit                   | <p>May be land disposed only if it meets the requirements in the table “Treatment Standards for Hazardous Waste” at TDEC 0400-12-01-.10(3)(a) before land disposal. The table lists either “total waste” standards, “waste-extract” standards, or “technology-specific” standards [as detailed further in TDEC 0400-12-01-.10(3)(c)].</p> <p>For characteristic wastes (D001–D043) that are subject to the treatment standards, all underlying hazardous constituents must meet the UTSs specified in TDEC 0400-12-01-.10(3)(i).</p> <p>Are not prohibited if the wastes no longer exhibit a characteristic at the point of land disposal, unless the wastes are subject to a specified method of treatment other than DEACT in TDEC 0400-12-01-.10(3)(a), or are D003 reactive cyanide.</p> <p>Prior to land disposal, soil contaminated with hazardous waste must be treated to meet the applicable alternative treatment standards of TDEC 0400-12-01-.10(3)(j)(3) or according to the applicable UTSs in TDEC 0400-12-01-.10(3)(i) applicable to the listed hazardous waste and/or applicable characteristic of hazardous waste if the soil is characteristic.</p> | <p>Land disposal, as defined in TDEC 0400-12-01-.10(1)(b), of RCRA-restricted waste—<b>applicable</b></p> <p>Land disposal of restricted RCRA characteristic wastes (D001–D043) that are not managed in a wastewater treatment unit that is regulated under the CWA, that is CWA equivalent, or that is injected into a Class I non-hazardous injection well—<b>applicable</b></p> <p>Land disposal of RCRA-restricted characteristic wastes—<b>applicable</b></p> <p>Land disposal, as defined in TDEC 0400-12-01-.10(1)(b), of RCRA-restricted hazardous soils—<b>applicable</b></p> | <p>40 <i>CFR</i> 268.40(a)<br/>TDEC 0400-12-01-.10(3)(a)</p> <p>40 <i>CFR</i> 268.40(e)<br/>TDEC 0400-12-01-.10(3)(a)(5)</p> <p>40 <i>CFR</i> 268.1(c)(4)(iv)<br/>TDEC 0400-12-01-.10(1)(a)(3)(iv)</p> <p>40 <i>CFR</i> 268.49(b)<br/>TDEC 0400-12-01-.10(3)(j)(2)</p> |
| Variance from a treatment standard for RCRA restricted hazardous wastes | <p>A variance from a treatment standard may be approved if it is:</p> <ul style="list-style-type: none"> <li>• Not physically possible to treat the waste to the level specified in the treatment standard, or by the method specified as the standard; or</li> <li>• Inappropriate to require the waste to be treated to the level specified in the treatment standard or by the method specified as the treatment standard even though such treatment is technically possible.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Generation of a RCRA hazardous waste requiring treatment prior to land disposal— <b>applicable</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 40 <i>CFR</i> 268.44<br>TDEC 0400-12-01-.10(3)(e)                                                                                                                                                                                                                      |

| Disposal of bulk or containerized liquids in a RCRA landfill               | <p>May not dispose of bulk or non-containerized liquid hazardous waste or hazardous waste containing free liquids (whether or not sorbents have been added) in any landfill.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Placement of bulk or non-containerized RCRA hazardous waste—<b>applicable</b></p>                                                              | <p>40 <i>CFR</i> 264.314(a)<br/>TDEC 0400-12-01-.06(14)(o)(1)</p>                                                                                                                               |
| Disposal of containers in RCRA landfill                                    | <p>May not place containers holding free liquid in a landfill unless the liquid is mixed with an absorbent, solidified, removed, or otherwise eliminated.</p> <p>Sorbents used to treat free liquids to be disposed of in landfills must be non-biodegradable as described in TDEC 0400-12-01-.06(14)(o)(4)(i).</p> <p>Unless they are very small, containers must be either at least 90 percent full when placed in the landfill, or crushed, shredded, or similarly reduced in volume to the maximum practical extent before burial in the landfill.</p>                                                                                                                                                  | <p>Placement of containers containing RCRA hazardous waste in a landfill—<b>applicable</b></p>                                                    | <p>40 <i>CFR</i> 264.314(c)<br/>TDEC 0400-12-01-.06(14)(o)(3)</p> <p>40 <i>CFR</i> 264.314(d)<br/>TDEC 0400-12-01-.06(14)(o)(4)</p> <p>40 <i>CFR</i> 264.315<br/>TDEC 0400-12-01-.06(14)(p)</p> |
| Characterization of LLW (e.g., wastewater, contaminated PPE)               | <p>Shall be characterized using direct or indirect methods and the characterization documented in sufficient detail to ensure safe management and compliance with the WAC of the receiving facility.</p> <p>Characterization data shall, at a minimum, include the following information relevant to the management of the waste:</p> <ul style="list-style-type: none"> <li>• physical and chemical characteristics</li> <li>• volume, including the waste and any stabilization or absorbent media</li> <li>• weight of the container and contents</li> <li>• identities, activities, and concentrations of major radionuclides</li> <li>• characterization date</li> <li>• generating source.</li> </ul> | <p>Generation of LLW for storage and disposal at a DOE facility—<b>TBC</b></p>                                                                    | <p>DOE M 435.1-1(IV)(I)</p> <p>DOE M 435.1-1(IV)(I)(2)</p>                                                                                                                                      |

**Table A.3. Action-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Action                        | Requirements                                                                                                                                                                                                                                                                                                                                                 | Prerequisite                                                                                                                | Citation                     |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Packaging of LLW for disposal | Must not be packaged for disposal in cardboard or fiberboard boxes.                                                                                                                                                                                                                                                                                          | Generation of LLW for disposal at a LLW disposal facility— <b>relevant and appropriate</b>                                  | TDEC 0400-20-11-.17(7)(a)(1) |
|                               | Must be solidified or packaged in sufficient absorbent material to absorb twice the volume of liquid.                                                                                                                                                                                                                                                        | Generation of liquid LLW for disposal at a LLW disposal facility— <b>relevant and appropriate</b>                           | TDEC 0400-20-11-.17(7)(a)(2) |
|                               | Shall contain as little free standing and noncorrosive liquid as is reasonably achievable, but in no case shall the liquid exceed 1 percent of the volume.                                                                                                                                                                                                   | Generation of solid LLW containing liquid for disposal at a LLW disposal facility— <b>relevant and appropriate</b>          | TDEC 0400-20-11-.17(7)(a)(3) |
|                               | Must not be capable of detonation or of explosive decomposition or reaction at normal pressures and temperatures or of explosive reaction with water.                                                                                                                                                                                                        | Generation of LLW for disposal at a LLW disposal facility— <b>relevant and appropriate</b>                                  | TDEC 0400-20-11-.17(7)(a)(4) |
|                               | Must not contain, or be capable of, generating quantities of toxic gases, vapor, or fumes.                                                                                                                                                                                                                                                                   | Generation of LLW for disposal at a LLW disposal facility— <b>relevant and appropriate</b>                                  | TDEC 0400-20-11-.17(7)(a)(5) |
|                               | Must not be pyrophoric.                                                                                                                                                                                                                                                                                                                                      | Generation of LLW for disposal at a LLW disposal facility— <b>relevant and appropriate</b>                                  | TDEC 0400-20-11-.17(7)(a)(6) |
|                               | Must have structural stability either by processing the waste or placing the waste in a container or structure that provides stability after disposal.                                                                                                                                                                                                       | Generation of LLW for disposal at a LLW disposal facility— <b>relevant and appropriate</b>                                  | TDEC 0400-20-11-.17(7)(b)(1) |
|                               | Must be converted into a form that contains as little free standing and noncorrosive liquid as is reasonably achievable, but in no case shall the liquid exceed 1 percent of the volume of the waste when the waste is in a disposal container designed to ensure stability, or 0.5 percent of the volume of the waste for waste processed to a stable form. | Generation of liquid LLW or LLW containing liquids for disposal at a LLW disposal facility— <b>relevant and appropriate</b> | TDEC 0400-20-11-.17(7)(b)(2) |
|                               | Void spaces within the waste and between the waste and its package must be reduced to the extent practicable.                                                                                                                                                                                                                                                | Generation of LLW for disposal at a LLW disposal facility— <b>relevant and appropriate</b>                                  | TDEC 0400-20-11-.17(7)(b)(3) |

**Table A.3. Action-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Action                         | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Prerequisite                                                                                                                                                                                                                                                | Citation                                                                                                                            |

| Corrective measures based on monitoring    | <p>Must have plans for taking corrective measures if migration of radionuclides would indicate that the performance objectives may not be met.</p> <p><i>[NOTE: Performance Objectives are those given at TDEC 0400-20-11-.16(1), (2), (4), and (5).]</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Land disposal of LLW— <b>relevant and appropriate</b>                               | TDEC 0400-20-11-.17(4)(b)                                        |
| Construction and operations monitoring     | During site construction and operation, shall maintain a monitoring program, including a monitoring system. The monitoring system must be capable of providing early warning of releases of radionuclides from the disposal unit before they leave the site boundary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Land disposal of LLW— <b>relevant and appropriate</b>                               | TDEC 0400-20-11-.17(4)(c)                                        |
| Post-operations monitoring                 | After the disposal site is closed, post-operational surveillance of the disposal site shall be maintained by a monitoring system based on the operating history and the closure and stabilization of the disposal site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Land disposal of LLW— <b>relevant and appropriate</b>                               | TDEC 0400-20-11-.17(4)(d)                                        |
| Groundwater and surface water monitoring   | The groundwater and surface water from the disposal site area must be sampled prior to commencing operation for use as baseline data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Construction of TSCA chemical waste landfill— <b>applicable</b>                     | 40 <i>CFR</i> 761.75(b)(6)(i)(A)                                 |
| Surface water monitoring                   | Designated surface water course shall be sampled at least monthly when the landfill is being used for disposal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Operation of a TSCA chemical waste landfill— <b>applicable</b>                      | 40 <i>CFR</i> 761.75(b)(6)(i)(B)                                 |
| Leachate collection system                 | Leachate collection systems shall be monitored monthly for quantity and physicochemical characteristics of leachate produced. The leachate should be either treated to acceptable limits for discharge in accordance with a state or federal permit or disposed of by another state or federally approved method. Water analysis shall be conducted as provided in paragraph (b)(6)(iii) of this section.                                                                                                                                                                                                                                                                                                                                                                                                                          | Operation of a TSCA chemical waste landfill— <b>applicable</b>                      | 40 <i>CFR</i> 761.75(b)(7)                                       |
| Monitoring well construction and operation | All monitoring wells shall be cased and the annular space between the monitor zone (zone of saturation) and the surface shall be completely backfilled with Portland cement or an equivalent material and plugged with Portland cement to effectively prevent percolation of surface water into the well bore. The well opening at the surface shall have a removable cap to provide access and to prevent entrance of rainfall or stormwater runoff. The groundwater monitoring well shall be pumped to remove the volume of liquid initially contained in the well before obtaining a sample for analysis. The discharge shall be treated to meet applicable state or federal standards or recycled to the chemical waste landfill.                                                                                              | Construction and operation of a TSCA groundwater monitoring well— <b>applicable</b> | 40 <i>CFR</i> 761.75(b)(6)(ii)(B)                                |
| Operation of leachate collection system    | After the cover is installed, must record the amount of liquids removed from the leak detection system at least monthly. If the liquid level in the sump stays below the pump operating level for two consecutive months, the amount of liquids in the sumps must be recorded at least quarterly. If the liquid level in the sump stays below the pump operating level for two consecutive quarters, the amount of liquids in the sumps must be recorded at least semi-annually. If at any time during the post-closure care period the pump operating level is exceeded at units on quarterly or semi-annual recording schedules, the owner or operator must return to monthly recording of amounts of liquids removed from each sump until the liquid level again stays below the pump operating level for 2 consecutive months. | Closure of a RCRA landfill— <b>applicable</b>                                       | 40 <i>CFR</i> 264.303(c)(2)<br>TDEC 0400-12-01-.06(14)(d)(3)(ii) |

**Table A.3. Action-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Action                                                                 | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Prerequisite                                                                                                                          | Citation                                                                                                                                                                                                                                                                                                                                                                                        |

| General post-closure care                                              | Must maintain and monitor a groundwater monitoring system and comply with all other applicable provisions of TDEC 0400-12-01-.06(6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Closure of a RCRA landfill— <b>applicable</b>                                                                                         | 40 <i>CFR</i> 264.310(b)(4)<br>TDEC 0400-12-01-.06(14)(k)(2)(iv)                                                                                                                                                                                                                                                                                                                                |
| Determining RCRA concentration limits                                  | Concentration limits shall be determined taking into account those constituents that are reasonably expected to be contained in or derived from waste present in the landfill. These limits must not exceed those listed in TDEC 0400-12-01-.06(6)(e), Table 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | RCRA hazardous constituents detected in groundwater in the uppermost aquifer underlying a hazardous waste landfill— <b>applicable</b> | 40 <i>CFR</i> 264.94(a)<br>TDEC 0400-12-01-.06(6)(e)(1)                                                                                                                                                                                                                                                                                                                                         |
| Groundwater monitoring well construction                               | All monitoring wells must be cased in a manner that maintains the integrity of the monitoring well bore hole. This casing must be screened or perforated and packed with gravel or sand, where necessary, to enable collection of groundwater samples. The annular space (i.e., the space between the bore hole and well casing) above the sampling depth must be sealed to prevent contamination of samples and the groundwater.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Construction of RCRA groundwater monitoring well— <b>applicable</b>                                                                   | 40 <i>CFR</i> 264.97(c)<br>TDEC 0400-12-01-.06(6)(h)(3)                                                                                                                                                                                                                                                                                                                                         |
| Groundwater monitoring requirements for RCRA hazardous waste landfills | <p>The groundwater monitoring system must consist of a sufficient number of wells, installed at appropriate locations and depths to yield samples from the uppermost aquifer that:</p> <ul style="list-style-type: none"> <li>• Represent the quality of background groundwater;</li> <li>• Represent the quality of groundwater passing the point of compliance; and</li> <li>• Allow for the detection of contamination when the hazardous waste or constituents have migrated from the waste management area to the uppermost aquifer.</li> </ul> <p>Groundwater monitoring program must include consistent sampling and analysis procedures that are designed to ensure monitoring results that provide a reliable indication of groundwater quality below the waste management area.</p> <p>Groundwater monitoring program must include sampling and analytical methods that are appropriate and accurately measure hazardous constituents in groundwater samples.</p> <p>Groundwater monitoring program must include a determination of the groundwater surface elevation each time groundwater is sampled.</p> <p>The number and size of samples collected to establish background and measure groundwater quality at the point of compliance shall be appropriate for the form of statistical test employed following generally accepted statistical principles.</p> <p>The owner or operator will specify one of the following statistical methods to be used in evaluating groundwater monitoring data for each hazardous constituent. The statistical test chosen shall be conducted separately for each hazardous constituent in each well. Where PQLs are used in any of the following statistical procedures to comply with TDEC 0400-12-01-.06(6)(h)(9)(v), the PQL must be proposed by the owner or operator and approved by Tennessee and EPA through the CERCLA process. Use of any of the following statistical methods must be protective of human health and the environment and must comply with the performance standards outlined in TDEC 0400-12-01-.06(6)(h)(9).</p> | Operation of a detection monitoring program under TDEC 0400-12-01-.06(6)(i)— <b>applicable</b>                                        | <p>40 <i>CFR</i> 264.97(a)<br/>TDEC 0400-12-01-.06(6)(h)(1)</p> <p>40 <i>CFR</i> 264.97(d)<br/>TDEC 0400-12-01-.06(6)(h)(4)</p> <p>40 <i>CFR</i> 264.97(e)<br/>TDEC 0400-12-01-.06(6)(h)(5)</p> <p>40 <i>CFR</i> 264.97(f)<br/>TDEC 0400-12-01-.06(6)(h)(6)</p> <p>40 <i>CFR</i> 264.97(g)<br/>TDEC 0400-12-01-.06(6)(h)(7)</p> <p>40 <i>CFR</i> 264.97(h)<br/>TDEC 0400-12-01-.06(6)(h)(8)</p> |

| Prevention of pollution through application of treatment           | <p>In order to permit the reasonable and necessary uses of the Waters of the State, existing pollution should be corrected as rapidly as practicable, and future pollution prevented through the level of treatment technology applicable to a specific source or that greater level of technology necessary to meet water quality standards; i.e., modeling and stream survey assessments, treatment plants or other control measures.<sup>18</sup></p> <p>Technology-based treatment requirements cannot be satisfied through the use of “non-treatment” techniques such as flow augmentation and in-stream mechanical aerators.</p> | <p>Point source discharge of pollutants as defined in 40 <i>CFR</i> 122.2 into surface water—<b>applicable</b></p> <p>Point source discharge of radionuclides into surface water—<b>relevant and appropriate</b></p>  | <p>TDEC 0400-40-03-.02(4)<br/><i>General considerations</i></p> <p>40 <i>CFR</i> 125.3(f)</p>                                                                     |
| Application of most stringent criteria                             | <p>Since all Waters of the State are classified for more than one use, the most stringent criteria will be applicable.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                       | <p>TDEC 0400-40-03-.02(5)<br/><i>General considerations</i></p>                                                                                                   |
| Compliance with narrative water quality criteria                   | <p>Interpretation and application of narrative criteria shall be based on available scientific literature and EPA guidance and regulations.</p> <p><i>[NOTE: For radionuclides, exposure assumptions will be based on site-specific exposures and DOE's reasonable anticipated future land uses.]</i></p>                                                                                                                                                                                                                                                                                                                              | <p>Point source discharge of pollutants as defined in 40 <i>CFR</i> 122.2 into surface water —<b>applicable</b></p> <p>Point source discharge of radionuclides into surface water—<b>relevant and appropriate</b></p> | <p>TDEC 0400-40-03-.02(10)<br/><i>General considerations</i></p>                                                                                                  |

<sup>18</sup> Treatment may be necessary to meet Tennessee water quality standards. Consistent with the Administrator’s Decision dated December 31,2020, TBEL requirements are not considered relevant and appropriate to discharges of radionuclides at this Site.

**Table A.3. Action-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Action                                                       | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Prerequisite                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Citation                                                                                                                                |
|--------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <p>Application of stream flow for water quality criteria</p> | <p>Fish and aquatic life water quality criteria shall generally be applied on the basis of stream flows equal to or exceeding the 7-day minimum, 10-year recurrence interval. All other criteria shall be applied on the basis of stream flows equal to or exceeding the 30-day minimum 5-year recurrence interval.</p> <p>The frequency, magnitude and duration of deviations from normal water conditions shall be considered in interpreting the water quality criteria. When interpreting pathogen data, samples collected during or immediately after significant rain events may be treated as outliers unless caused by point source dischargers.</p>                                                                                                                                                                                                                                                                                | <p>Discharge of pollutants as defined in 40 <i>CFR</i> 122.2 into surface water Classified as <i>Fish and Aquatic Life</i>—<b>applicable</b></p> <p>Discharge of radionuclides into surface water Classified as <i>Fish and Aquatic Life</i>—<b>relevant and appropriate</b></p> <p>Point source discharge of pollutants as defined in 40 <i>CFR</i> 122.2 into surface water—<b>applicable</b></p> <p>Point source discharge of radionuclides into surface water—<b>relevant and appropriate</b></p> | <p>TDEC 0400-40-03-.05(4)<br/><i>Interpretation of criteria</i></p> <p>TDEC 0400-40-03-.05(5)<br/><i>Interpretation of criteria</i></p> |
| <p>Application of water quality criteria</p>                 | <p>The criteria and standards provide that all discharges of sewage, industrial waste, and other waste shall receive the degree of treatment or effluent reduction necessary to comply with water quality standards, or state or federal laws and regulations pursuant thereto, and where appropriate will comply with the "Standards of Performance" as required by the Tennessee Water Quality Control Act, (T.C.A., §§ 69-3-101, et seq.). (See FN 1.)</p> <p>Where naturally formed conditions or background water quality conditions are substantial impediments to attainment of the water quality standards, these conditions shall be taken into consideration in establishing any effluent limitations or restriction on discharge to such waters. For purposes of water quality assessment, exceedances of water quality standards caused by natural conditions will not be considered the condition of pollution impairment.</p> | <p>Point source discharge of pollutants as defined in 40 <i>CFR</i> 122.2 into surface water—<b>applicable</b></p> <p>Point source discharge of radionuclides into surface water—<b>relevant and appropriate</b></p> <p>Point source discharge of pollutants as defined in 40 <i>CFR</i> 122.2 into surface water—<b>applicable</b></p> <p>Point source discharge of radionuclides into surface water—<b>relevant and appropriate</b></p>                                                             | <p>TDEC 0400-40-03-.05(6)<br/><i>Interpretation of criteria</i></p> <p>TDEC 0400-40-03-.05(7)<br/><i>Interpretation of criteria</i></p> |

**Table A.3. Action-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Action                               | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Prerequisite                                                                                                                                                                                                                                      | Citation                                |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|
| Use of Reporting Limits              | <p>All chemical data reported under this rule shall be generated using “sufficiently sensitive” analytical methods approved under 40 <i>CFR</i> 136 (2018) or required under 40 <i>CFR</i> Chapter I, subchapter N or O (2018).</p> <p>An approved method is “sufficiently sensitive” when:</p> <ul style="list-style-type: none"> <li>(a) The method ML is at or below the level of the applicable water quality criterion or the effluent limit established for the measured pollutant or pollutant parameter; or</li> <li>(b) The method ML is above the applicable water quality criterion or the effluent limit established, but the amount of the pollutant or pollutant parameter actually measured is high enough that the method detects and quantifies the level of the pollutant or pollutant parameter; or</li> <li>(c) Demonstration is made showing that the method used has the lowest ML of the approved methods for the measured pollutant or pollutant parameter in the sample/matrix being analyzed. (Documentation supporting this demonstration is to be submitted with reported data and shall include narrative justification for why the method chosen is believed to have the lowest ML of all approved methods identified in 40 <i>CFR</i> 136 (2018). The Director shall determine whether the submitted information demonstrates sufficient method sensitivity.)</li> </ul> <p>When there is no analytical method that has been approved under 40 <i>CFR</i> 136 (2018) or required under 40 <i>CFR</i> Chapter I, subchapter N or O (2018), and a specific method is not otherwise required by the Director, the applicant may use any suitable method but shall provide a description of the method. When selecting a suitable method, factors such as a method’s precision, accuracy, or resolution must be considered when assessing the performance of the method.</p> | <p>Point source discharge of pollutants as defined in 40 <i>CFR</i> 122.2 into surface water—<b>applicable</b></p> <p>Point source discharge of radionuclides into surface water—<b>relevant and appropriate</b></p>                              | TDEC 0400-40-03-.05(8)                  |
| Target Risk Level for Recreation WQC | The 10 <sup>-5</sup> risk level is used for all carcinogenic pollutants.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Derivation of WQC for pollutants in surface water classified for Recreation use—<b>applicable</b></p> <p>Derivation of WQC Equivalentents for radionuclides in surface water classified for Recreation use—<b>relevant and appropriate</b></p> | TDEC 0400-40-03-.03(4)(j)<br>Footnote c |

**Table A.3. Action-specific applicable or relevant and appropriate requirements for selected alternative (cont.)**

| Action                                                                          | Requirements                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Prerequisite                                                                                                                                                                                                                                                                                         | Citation                                                   |

<sup>19</sup> Radionuclides are not on the list of *regulated parameters*.

<sup>20</sup> “*Landfill wastewater* means all wastewater associated with, or produced by, landfilling activities except for sanitary wastewater, non-contaminated storm water, contaminated ground water, and wastewater from recovery pumping wells. Landfill wastewater includes, but is not limited to, leachate, gas collection condensate, drained free liquids, laboratory derived wastewater, contaminated storm water and contact wash water from washing truck, equipment, and railcar exteriors and surface areas which have come in direct contact with solid waste at the landfill facility.” 40 *CFR* 445.2(f). “*Contaminated storm water* means storm water which comes in direct contact with landfill wastes, the waste handling and treatment areas, or landfill wastewater as defined in paragraph (f) of this section. Some specific areas of a landfill that may produce contaminated storm water include (but are not limited to): the open face of an active landfill with exposed waste (no cover added); the areas around wastewater treatment operations; trucks, equipment or machinery that has been in direct contact with the waste; and waste dumping areas.” 40 *CFR* 445.2(b).

| Establishing effluent limits for whole effluent toxicity (cont.) | <p>Except as provided in this subparagraph, when the permitting authority determines, using the procedures in paragraph (d)(1)(ii) of this section, toxicity testing data, or other information, that a discharge causes, has the reasonable potential to cause, or contributes to an in-stream excursion above a narrative criterion within an applicable State water quality standard, the permit must contain effluent limits for whole effluent toxicity. Limits on whole effluent toxicity are not necessary where the permitting authority demonstrates in the fact sheet or statement of basis of the NPDES permit, using the procedures in paragraph (d)(1)(ii) of this section, that chemical-specific limits for the effluent are sufficient to attain and maintain applicable numeric and narrative State water quality standards.</p> <p><i>[NOTE: DOE is not required to obtain a permit for any part of a remedial action conducted entirely onsite, per CERCLA §121(e). Use of the term “permit” reflects regulatory language; in this remedial action, “permit” can generally be taken to mean the Record of Decision.]</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                | 40 <i>CFR</i> 122.44(d)(1)(v) |
| Discharge into surface waters                                    | For industrial discharges without applicable federal effluent guidelines, best professional judgment should be employed to determine appropriate effluent limitations and standards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Point source discharge of pollutants into surface water<br>— <b>applicable</b> | TDEC 0400-40-05-.09(1)(b)     |
| Discharge to a surface water not meeting water quality standards | <p>No permit may be issued: (i) To a new source or a new discharger, if the discharge from its construction or operation will cause or contribute to the violation of water quality standards. The owner or operator of a new source or new discharger proposing to discharge into a water segment which does not meet applicable water quality standards or is not expected to meet those standards even after the application of the effluent limitations required by Sects. 301(b)(1)(A) and 301(b)(1)(B) of CWA, and for which the State or interstate agency has performed a pollutants load allocation for the pollutant to be discharged, must demonstrate that:</p> <ol style="list-style-type: none"> <li>(1) There are sufficient remaining pollutant load allocations to allow for the discharge; and</li> <li>(2) The existing dischargers into that segment are subject to compliance schedules designed to bring the segment into compliance with applicable water quality standards. The Director may waive the submission of information by the new source or new discharger required by paragraph (i) of this section if the Director determines that the Director already has adequate information to evaluate the request.</li> </ol> <p><i>[NOTE: DOE is not required to obtain a permit for any part of a remedial action conducted entirely onsite, per CERCLA §121(e). Use of the term “permit” reflects regulatory language; in this remedial action, “permit” can generally be taken to mean the Record of Decision. “Pollutant” in this requirement shall include all radionuclides for which an effluent limitation is established under this remedial action.]</i></p> | Point source discharge of pollutants into surface water<br>— <b>applicable</b> | 40 <i>CFR</i> 122.4(i)        |

## Department of Energy

Oak Ridge Office of Environmental Management  
P.O. Box 2001  
Oak Ridge, Tennessee 37831

July 21, 2022

Ms. Samantha Urquhart-Foster  
Superfund and Emergency Response Division  
U.S. Environmental Protection Agency  
Region 4  
Atlanta Federal Center  
61 Forsyth Street  
Atlanta, Georgia 30303-8960

Mr. Randy C. Young  
State of Tennessee  
Department of Environment and Conservation  
Division of Remediation – DOE Oversight Office  
761 Emory Valley Road  
Oak Ridge, Tennessee 37830-7072

Dear Ms. Urquhart-Foster and Mr. Young:

***SUBMITTAL OF THE RECORD OF DECISION FOR COMPREHENSIVE ENVIRONMENTAL RESPONSE, COMPENSATION, AND LIABILITY ACT OAK RIDGE RESERVATION WASTE DISPOSAL AT THE ENVIRONMENTAL MANAGEMENT DISPOSAL FACILITY, OAK RIDGE, TENNESSEE (DOE/OR/01-2794&D2)***

In accordance with the *Oak Ridge Reservation Federal Facility Agreement* (FFA), the U.S. Department of Energy submits the subject Record of Decision for your approval and signature. This submittal (Enclosure 1) fulfills the FFA Appendix E milestone for transmittal of this document by July 22, 2022. This document has been revised to address the U.S. Environmental Protection Agency and Tennessee Department of Environment and Conservation comments on the D1 version. The responses to comments from the U.S. Environmental Protection Agency and Tennessee Department of Environment and Conservation are also enclosed (Enclosures 2 and 3).

In accordance with the Review Cycle Protocol in the FFA for the subject Record of Decision, approval is requested within 30 calendar days of the date of this transmittal, or by August 22, 2022. Signatures are required 30 calendar days following approval, or by September 21, 2022. If the D2 primary document cannot be approved within the approval period protocol for this document, the U.S. Department of Energy declares this document to be in informal dispute, consistent with FFA protocol under Section XXX, *Extensions*.

**SUBMITTAL OF THE RECORD OF DECISION FOR COMPREHENSIVE ENVIRONMENTAL RESPONSE, COMPENSATION, AND LIABILITY ACT OAK RIDGE RESERVATION WASTE DISPOSAL AT THE ENVIRONMENTAL MANAGEMENT DISPOSAL FACILITY, OAK RIDGE, TENNESSEE (DOE/OR/01-2794&D2)**

If you have any questions or if we can be of further assistance, please contact Roger Petrie at (865) 241-6344 or Brian Henry at (865) 241-8340.

Sincerely,

**Brian Henry**

| <b>GENERAL COMMENTS</b> |             |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| D<br>Inventory          | 1           |               | The D1 ROD lacks limits for radionuclides in surface water, and does not provide sufficient information on the volume and activity of radionuclides and mercury that will be disposed in the EMDF. While EPA is aware that DOE is developing this information, not having them for review in the D1 ROD delays EPA's ability to evaluate whether the ROD is protective and complies with ARARs.                                                                                                        | <p>Agree. An FFA party working team was established in early 2021 following receipt of the EPA Administrator's dispute resolution decision. The specific remediation goals for landfill wastewater are specified in the D2 ROD (Sect. 2.12.2.4). The approach was agreed upon among the FFA parties. The discharge limits will be developed in the future, based on the remediation goals, when the specifics of the EMDF landfill wastewater treatment systems are known, including the discharge location. The remediation goals and future discharge limits are within the CERCLA risk range and protective of Human Health and the Environment.</p> <p>The D2 ROD provides the estimated radionuclide inventory used for the EMDF PA. Inventories of mercury will be limited by the agreement among the FFA parties to exclude mercury toxicity characteristics waste from the EMDF. Mercury releases to the environment will be reduced by treatment of all landfill wastewater collected during disposal operations.</p> |
| A                       | 2           |               | The D1 ROD does not clearly state that the Clean Water Act (CWA) is an ARAR for radiological discharges, per the wastewater dispute decision (Wheeler, 12/31/20). Please address this oversight and state that the CWA is an ARAR for radiological discharge as appropriate throughout the document.                                                                                                                                                                                                   | Agree. The ROD was revised to include the CWA as an ARAR for the radiological discharges per the wastewater dispute decision.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| E                       | 3           |               | This Record of Decision (ROD) is specifically selecting Central Bear Creek Valley (CBCV) <b>Site 7c</b> as the location for the EMDF. Many references throughout the ROD cite CBCV but nothing is mentioned specific to Site 7c. The 2017 RI/FS also identifies Site 7a (in a dual site plan) overlapping Site 7c and this is shown in the ROD as Figure 2.2. Which landfill configuration is being selected? Please specify Site 7c in association with reference to CBCV and identify it on a map so | Agree. Text revised throughout the ROD to clarify the specific CBCV site, Site 7c, for the EMDF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|          |             |               | the reader can understand its specific location and configuration in Bear Creek Valley (Note: Site 7c is shown in Figures 2.4. and 2.5. on pages 56 and 58 of the D1 ROD but not identified as such. Site 7c should be clearly identified as the location of the EMDF throughout this ROD).                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                            |
| E        | 4           |               | Sections 1.1 and 2.1, and repeated throughout document. The name of the NPL site is Oak Ridge Reservation (USDOE), per the original rule, published in 48184 - 48189 Federal Register / Vol. 54, No. 223 / Tuesday, November 21, 1989. The D1 ROD consistently identifies the site as Oak Ridge NPL site, rather than using the correct term Oak Ridge Reservation (USDOE) NPL site. Abbreviating the site name is acceptable, but the correct text should be used in Sections 1.1 and 2.1, and the abbreviation defined (see <a href="https://semspub.epa.gov/work/HQ/189634.pdf">https://semspub.epa.gov/work/HQ/189634.pdf</a> ). | Agree. The NPL site title [Oak Ridge Reservation (USDOE) NPL site] is abbreviated to Oak Ridge NPL Site. This abbreviation has been corrected throughout the document and introduced/defined in Sect. 1.2. |

| O<br>Climate change | 5           |               | <p>The ROD includes an evaluation of greenhouse gas emissions for the offsite disposal alternative. EPA expects the ROD to include a discussion of the potential impacts of climate change on the proposed remedy, including potential changes in rainfall, storm events and hydrologic conditions, and climate resiliency measures to be addressed in the design and construction of the remedy. Please include and address this information in the appropriate sections of the revised ROD.</p> | <p>Agree. The following text was added to describe the climate resiliency afforded by this remedy.</p> <p>Section 1.4 - Text added at the end of the third bullet: “The final design will also satisfy considerations of the impacts of climate change.”</p> <p>Text was added to Sect. 2.12.2, third bullet: “The design, construction, and operation of EMDF at the CBCV site to satisfy design-based and performance-based requirements of ARARs and to include climate resiliency measures.”</p> <p>Text was added to the end of Sect. 2.12.2.1 as follows:</p> <p>“The landfill siting and design reduce concerns from climate change and provide resiliency to potential increase in rainfall and flood events through the following measures:</p> <ul style="list-style-type: none"> <li>• Located outside the 100-year floodplain and on Pine Ridge, away from and at a greater elevation than Bear Creek. Waste elevation is approximately 60 ft higher than Bear Creek elevation in this area.</li> <li>• Landfill does not cross one of the northern tributaries. Tributary immediately west of the landfill will be armored and widened to improve run-off. Tributary immediately east of the landfill will be diverted into an adjacent tributary. Culverts beneath the existing Haul Road will be oversized to improve drainage from the area and eliminate ponding.</li> <li>• Upgradient diversion ditch is considerably oversized – greater than 100-year storm event.</li> </ul> <p>Additional considerations will be part of the post-ROD Remedial Design Report for the final design that will be submitted for FFA party review and approval.</p> |

| Category  | Comment No. | Sect/<br>Page | Comment                                                                                                                                                                                                                                                                                                                                                                                                          | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|-------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| W         | 6           |               | The draft ROD refers to LLW and higher-level waste. Add definitions of these terms to the ROD, including maximum radioactivity levels and volumes.                                                                                                                                                                                                                                                               | Agree. Low-level waste is officially defined by what it is not. TDEC 0400-20-11-.03(21) defines LLW and this is added as a footnote (No. 4) at the first occurrence of 'LLW' (it has also been added to the administrative WAC Table 2.4). Higher-level waste is explained to be waste that exceeds Waste Acceptance Criteria for the EMDF (see Sect. 2.5.6).<br><br>Maximum radioactivity levels for types of radioactive waste do not exist.                                                                                                                                                                                           |
| D         | 7           |               | The 2021 FFS should be revised, per EPA and TDEC comments on the D3, and approved prior to issuance of the D2 EMDF ROD. The water quality criteria for radionuclides discharged to Bear Creek will be developed in the FFS and must be incorporated in the revised EMDF ROD.                                                                                                                                     | Clarification provided. As noted in the response to General Comment 1, an FFA party working team was established in early 2021 following receipt of the EPA Administrator's dispute resolution decision. This working team has come to consensus on the exposure scenarios to protect human health and the environment in Bear Creek. The agreement was incorporated into the revised FFS and D2 ROD.                                                                                                                                                                                                                                    |
| L         | 8           |               | The draft ROD makes changes land use designations and creates new land use designations. CERCLA RODs or remedies can make land use assumptions based on land use designations that are typically set at the local level. In this case, land use designation would be set in a DOE Facility Land Use Plan. The draft ROD should be clear on that issue and provide a basis for changing the land use assumptions. | Clarification provided. The <i>Final Report of the Oak Ridge Land Use Planning Focus Group (2002)</i> defines Bear Creek Valley (BCV), as part of a greater portion of the Oak Ridge Reservation, as a DOE future mission area that is unavailable for consideration for other uses. The designation of zones, as discussed in the ROD, is applicable only in setting cleanup goals for the particular area/zone under CERCLA. The text in the ROD has been modified to reference the more recent <i>Oak Ridge Reservation Planning: Integrating Multiple Land Use Needs (DOE 2021)</i> and <i>DOE's End State Vision (DOE 2004)</i> , . |
| Inventory | 9           |               | Disposal of Rn-222 may result in radon emissions relevant to worker protection. Has this been evaluated for EMDF?                                                                                                                                                                                                                                                                                                | The radon release analysis developed for the EMDF PA (Attachment H) demonstrated that the estimated inventory of Rn-222 precursors (including U-238, U-234, Th-230, and Ra-226) will not generate a Rn-222 flux at the waste surface that exceeds the regulatory standard (20 pCi/m <sup>2</sup> /s) given at 40 CFR 192 Subpart A (the EMDF ROD ARAR – Sect. 192.02 <i>Standards for the Control of Residual Radioactive Materials from Inactive Uranium Processing</i>                                                                                                                                                                 |

| Category | Comment No. | Sect/<br>Page | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|          |             |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <i>Sites</i> and at 40 CFR 61 Subpart W (National Emission Standards for Hazardous Air Pollutants, Sect. 61.252 <i>National Emission Standards for Radon Emissions From Operating Mill Tailings</i> ). This analysis demonstrates that workers during the operational period and members of the public during the post-closure period will be protected from unacceptable exposure to Rn-222. In addition, there is a robust radiological worker safety program that will be implemented for the EMDF similar to what is implemented at the EMWMF that will ensure radon exposure is within worker protection limits.                        |
| P        | 10          |               | EPA and TDEC have determined, and DOE has agreed, that the EMDF ROD merits additional public involvement activities before finalization. Public involvement should include new information developed since the September 2018 Proposed Plan specifically the WAC, limits for radionuclides and mercury in surface water, and groundwater elevation at the proposed site location. Resulting public comments and responsiveness should be included in the final ROD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Agree. With submittal of the D1 ROD, the FFA parties have recommended additional public engagement. That effort allows for additional public comment, and responses to additional comments are addressed within the D2 ROD.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| P        | 11          |               | The regulatory agencies must have the opportunity to review and approve the proposed WAC, limits for radionuclides and mercury in surface water, and the Site 7c location information before this information is presented to the public for comment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | The fact sheets presented to the public as part of the additional public engagement period were developed by and approved by the three FFA parties. These fact sheets provide updated materials/information given in the D1 ROD, where appropriate.                                                                                                                                                                                                                                                                                                                                                                                          |
| D        | 12          |               | Cleanup Levels Not Provided/Incorrect Compliance Measurement – Pursuant to the National Contingency Plan (NCP) at 40 CFR § 300.430(f)(5)(iii), “The ROD also shall indicate, as appropriate, the remediation goals discussed in paragraph (e)(2)(i) of this section, that the remedy is expected to achieve. Performance shall be measured at appropriate locations in the groundwater, surface water, soils, air, and other affected media.” In the case of the EMDF landfill generated wastewater that will be discharged into Bear Creek (or its tributaries) the remediation goals (i.e., cleanup levels) shall include effluent limits based on instream ambient water quality criteria (AWQC) equivalent for radionuclides that have been properly derived in accordance with identified ‘applicable or relevant and appropriate requirements’ (ARARs). Consistent with the NCP and as required by the Clean Water Act (CWA) regulations identified as ARARs (Ref. Assistant Administrator Peter Wright ARARs table from Jan 19, 2021 letter issued pursuant to Administrator Wheeler decision on Dec. 31, 2020 on the Wastewater FFS dispute), the effluent limits must be met at the point of discharge into the surface | Clarification provided. As noted in the response to General Comment 1, an FFA party working team was established in early 2021 following receipt of the EPA Administrator’s dispute resolution decision. This working team has come to consensus on the exposure scenarios to protect human health and the environment in Bear Creek. This agreement was added to the ROD, along with a summary description of the process.<br><br>As noted in the response to General Comment 7, the FFS was revised when consensus was reached. As discussed with the FFA party working team, this document contains the more in-depth discussion of PRGs. |

|----------|-------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|          |             |               | <p>water (i.e., end of the pipe<sup>1</sup>) and AWQC equivalents (as well as other AWQC and narrative criteria under TDEC Water Quality Criteria regulations) must be met throughout stream<sup>2</sup> (not some point downstream of the discharge where DOE believes exposure from fishing might occur).</p> <p>Neither these effluent limits nor instream criteria (i.e., remediation goals or cleanup levels) were included in the draft ROD, and thus the ROD is not consistent with the aforementioned NCP requirements at 40 CFR 300.430(f)(5)(iii). Further, the Oak Ridge Reservation (ORR) Federal Facility Agreement (FFA) Section III. PURPOSE. 2. also requires that DOE develop, implement, and monitor appropriate response actions at the Site in accordance with CERCLA, the NCP, RCRA, NEPA, appropriate guidance and policy, and in accordance with Tennessee State law. Accordingly, DOE must include instream AWQC equivalent concentrations for radionuclides in a draft ROD before EPA can fully determine its sufficiency and consistency with the NCP. These PRGs should be consistent with 40 CFR § 300.430(e)(2)(i) and based on ARARs where available and discussed in the appropriate section of the draft ROD consistent with EPA guidance (e.g., <i>A Guide To Preparing Superfund Proposed Plans, Records of Decision, and Other Remedy Selection Decision Documents</i>, EPA 540-R-98-031, OSWER 9200.1-23P, July 1999).</p> <p>In addition, consistent with CERCLA (e.g., section 113 and 117) and the NCP, the PRGs need to be developed and explained in the Revised <i>Focused Feasibility Study for Water Management for Disposal of CERCLA Waste on the Oak Ridge Reservation</i> [hereinafter “Revised Wastewater FFS” or “Revised FFS”] that is approved by EPA pursuant to the ORR FFA requirements for review and approval of Primary Documents in order to have an adequate Administrative Record supporting the final decision in the ROD. EPA is aware that the DOE is revising the FFS, per EPA and TDEC comments on the D3 FFS, and expects the next version of the ROD to include instream water quality levels (“AWQC equivalents”) discussed in this comment.</p> <p><sup>1</sup> Ref. TDEC 0400-40-05-.07(2)(h), TDEC 0400-40-05-.08(1)(k) “All permit effluent limitations, standards, and prohibitions shall be established for each outfall or discharge point...” and 40 CFR § 122.44(i) <i>Monitoring requirements</i>. See also NCP Preamble at 53 Fed Reg 51440 (Dec. 21, 1988) “...discharges of toxic pollutants to receiving waters is measured for compliance at the discharge point (i.e., “end of the pipe”).” For purposes of these comments the terms ‘discharge point’, ‘end of pipe’, ‘outfall’, ‘point of discharge’ all have the same meaning for purposes of measurement (i.e., monitoring) of hazardous substances in wastewater effluent that is discharged into surface water.</p> |          |

| A        | 13          |               | <p>Compliance with ARARs – CERCLA Section 121(d)(2)(A) establishes compliance with ARARs as a threshold criterion for remedy selection. As mentioned above and described more fully below in the Specific Comments, DOE did not include all of the ARARs required to be met by the landfill remedial action, including those in the December 31, 2020 Administrator Wheeler Decision (Wheeler Decision) (<u>See</u>: Ref. Table submitted by EPA Assistant Administrator Peter C. Wright in letter dated January 19, 2021) that should have been in the Revised Wastewater FFS and ultimately included in the ROD for the preferred alternative of construction, operation, closure and post-closure of the onsite EMDF which includes wastewater management. For example, DOE has not included certain CWA and RCRA requirements related to effluent limits from a RCRA landfill (40 CFR part 445) and RCRA tank system requirements in 40 CFR 264.192 et. seq. that EPA maintains are ARARs for this remedial action which could include management of wastewater and/or leachate that is considered RCRA hazardous waste. Pursuant to ORR FFA Section XXI.F. <u>Identification and Determination of Potential ARARs</u> - “D1 ARARs determinations shall be prepared by the DOE in accordance with Section 121(d)(2) of CERCLA, 42 U.S.C. § 9621(d)(2), the NCP, and pertinent guidance issued by EPA.”</p> <p>Additionally, DOE has proposed in the June 2021 Revised FFS point(s) of measuring compliance with water quality-based effluent limits and instream AWQC equivalent that are inconsistent with CWA NPDES regulations that were identified as ARARs (including those in EPA’s Jan. 19, 2021 submittal pursuant to the Wheeler Decision) and carried that flawed approach into the ROD as part of the selected remedy. The DOE effluent limits for radionuclides in the Revised FFS are based on a dilution factor of 64x and use approximately 4 kilometers of Bear Creek to mix and dilute the concentrations of radionuclides in the landfill wastewater which is not allowed under EPA and TDEC CWA regulations for bioaccumulative carcinogens. As described more fully below in Specific Comments, DOE has apparently mis-interpreted certain CWA regulations and TDEC water quality criteria regulations identified as ARARs which effectively resulted in creating a new/modified Recreation Use Classification for Bear Creek specifically for radionuclides which is not allowed except by TDEC pursuant to its rulemaking process and approved by EPA. Instead, it appears that DOE is using a point of exposure for measuring radiation dose identified in the TDEC regulations</p> | <p>Clarification provided. The D2 ROD contains ARARs as agreed to by the FFA parties. Signature of the ROD signifies all three parties are in agreement on all information, including ARARs, as contained in that document.</p> <p>DOE has worked with EPA and TDEC since the D1 EMDF ROD to identify the parameters to be used in developing landfill wastewater effluent limitations in compliance with ARARs per the wastewater dispute decision. The ROD has been revised to include the CWA as ARAR for the radiological discharges and other ARARs identified by the ARARs table submitted by EPA Assistant Administrator Wright on January 19, 2021, including the 40 CFR 445 RCRA effluent limitations.</p> |

|----------|-------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|          |             |               | <p>for near surface radioactive waste land disposal that are based upon Nuclear Regulatory Commission (NRC) regulations at 10 CFR part 61.41.</p> <p>[See language in ROD Section 2.13.2 <u>Compliance with ARARs</u> - “The following NRC-based TDEC regulations are relevant and appropriate: TDEC 0400-20-11-.16(2) [equivalent to 10 CFR 61.41] and TDEC 0400-20-11-.16(4) [equivalent to 10 CFR 61.43]. These ARARs are used along with site-specific parameters to develop limits on radiological discharges during operations that ensure protection of human health and the environment;” <i>see also</i> language in ROD Section 2.12.2.4 “These ARARs developed by the NRC provide dose limits for protecting the public. Compliance with the ARARs is required at the nearest point of public exposure which is downstream of the facility.” “Discharge limits will be implemented where waters are discharged from the landfill operation, prior to mixing with proximate surface water.”]</p> <p>The NRC annual dose-based limits apply to protection of the public from landfill releases of radionuclides from all pathways including surface water<sup>3</sup>; however, there is no prescribed methodology or guidance on establishing protective effluent limits for radionuclides under this rule that considers the legally applicable TDEC <i>Use Classifications for Surface Water</i>. In addition, the NRC approach for measuring dose from a land disposal unit allows use of a ‘buffer zone’ which is defined as “a portion of the disposal site that is controlled by the licensee and that lies under the disposal units and between the disposal units and the boundary of the site<sup>4</sup>.” This approach is inconsistent with CWA and TDEC water quality standard regulations (identified as ARARs including those submitted by EPA pursuant to the Wheeler Decision) that require effluent limits to be met at the discharge point into surface water to achieve instream AWQC as well as narrative criteria throughout the surface water in order to fully protect the designated uses (See Footnote 2 above).</p> <p>As a result, the TDEC radioactive waste landfill regulation 0400-20-11-.16(2) is a <u>less stringent</u> ARAR than the CWA and TDEC water quality standards regulations that are also identified as ARARs for establishing and measuring compliance with effluent limits for radionuclides. Pursuant to the NCP at 55 Fed Reg 8741 (March 8, 1990), compliance with the more stringent ARAR is required for remedial actions in order to ensure all ARARs are met. These ARARs issues must be addressed by DOE in the Revised D3 Wastewater FFS and in the ROD in order to be compliant with CERCLA and consistent with the NCP and EPA guidance for a selected remedy as required by the ORR FFA. EPA is aware the FFS is currently being revised, and once approved, the resulting information should be in the</p> |          |

|          |             |               | <p>revised ROD.</p> <p><sup>3</sup> 10 CFR 61.41 (“Concentrations of radioactive material which may be released to the general environment in <u>groundwater, surface water, air, soil, plants, or animals</u> must not result in an annual dose exceeding an equivalent of 25 millirems to the whole body, 75 millirems to the thyroid, and 25 millirems to any other organ of any member of the public.” (Underline added))</p> <p><sup>4</sup> 10 CFR 61.2 <u>Definitions</u>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| D        | 14          |               | <p>Protection of Human Health the Environment – Statements by DOE asserting that the Draft ROD meets CERLCA and the NCP’s threshold requirements, namely overall protection of human health and the environment and compliance with ARARs, are premature and cannot be evaluated by EPA because the draft ROD does not specify remediation goals (including limits for radionuclides in surface water) and does not accurately apply ARARs (as described above) related to compliance with certain CWA and TDEC water quality standards identified as ARARs. Overall protection of human health and the environment and compliance with ARARs (unless a specific ARAR is waived) are threshold requirements that each alternative must meet in order to be eligible for selection [40 CFR § 300.430(f) <i>Selection of remedy</i>]. Similar to the ARARs issues described above, the identification of protective PRGs/cleanup levels must be addressed by DOE in the Revised D3 Wastewater FFS and in the ROD in order to be compliant with CERCLA and consistent with the NCP and EPA guidance for a selected remedy as required by the ORR FFA. EPA expects information developed in the revised and approved FFS will be incorporated into the revised ROD.</p> | See responses to General Comments 1 and 9.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| S        | 15          |               | <p>Please revise the ROD to discuss any long-term impacts of altered surface water hydrology and wetlands filling on potential for flooding and include wetlands ARARs. Please revise Table 2.1 comparing alternatives to consider potential long-term impacts on hydrology and flood retention.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Disagree. EMDF construction will alter surface water hydrology in a limited area between drainages. The design includes surface water controls with water storage basins which mitigate the potential for flooding as well as run-on/run-off controls and erosion/water controls. Wetland mitigation will be addressed in follow-on documents in accordance with the wetlands ARARs included in the ROD as agreed upon between the FFA parties. No revision to Table 2.1 is necessary. |
| D        | 16          |               | <p>EPA is aware the instream water quality values for radionuclides are being developed and expects these values to be included in the revised FFS (appendix K). Once the FFS is approved, EPA expects the instream water quality values to be included in the EMDF ROD prior to finalization of the ROD. As outlined in the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | See responses to General Comments 1 and 9.                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|          |             |               | <p>EPA’s July 22, 2021 comments on the D3 version <i>Focused Feasibility Study for Water Management for the Disposal of CERCLA Waste on the Oak Ridge Reservation</i>, and as noted in other comments of this letter, the EPA expects:</p> <ul style="list-style-type: none"> <li>a. the instream water quality values for radionuclides in Bear Creek to be set at 1x10E-5 risk level for the designated recreational use;</li> <li>b. EPA-approved instream water quality values for radionuclides in Bear Creek will be the basis of effluent discharge limits. [EPA understands that specific effluent discharge limits are to be developed once design parameters such as the assimilative capacity of the receiving surface water body at the point of discharge are available.] These water quality-based effluent discharge limits will be developed and monitored consistent with regulations and guidance established under CWA NPDES program and TN NPDES regulations, and included in a post ROD FFA primary document subject to EPA and TDEC approval;</li> <li>c. consistent with CERCLA, the NCP, and the Wheeler Decision, instream water quality values for radionuclides are risk-based cleanup goals and are not based on AEA/DOE Order-driven parameters, nor based on rationale that is tied to Institutional Controls ( e.g., fences and guards) or DOE land use designations;</li> <li>d. to the extent that development of instream water quality values for radionuclides in Bear Creek from landfill wastewater discharges deviate from the relevant EPA Office of Water guidance, CWA guidance default or TDEC guidance defaults, such as the use of site-specific consumption rates, any deviation must be supported by a well-reasoned and documented rationale for using specific parameters in place of CWA guidance or defaults;</li> <li>e. the remedy in the ROD will include a monitoring component that includes compliance monitoring of the instream water quality values for radionuclides and surface water conditions (such as assimilative capacity) to ensure that effluent discharge limits remain protective under CERCLA over time.</li> </ul> | <p>a – d Agree. The specific remediation goals for landfill wastewater are specified in the D2 ROD (Sect. 2.12.2.4). The approach was agreed upon among the FFA parties. The discharge limits will be developed in the future, based on the remediation goals, when the specifics of the EMDF landfill wastewater treatment systems are known, including the discharge location. The remediation goals and future discharge limits are within the CERCLA risk range and protective of Human Health and the Environment.</p> <p>e. Clarification provided. ARARs are provided in the ROD that ensure monitoring is conducted as required. Monitoring details will be described in the post-ROD Sampling and Analysis Plan that will be approved as part of the primary document Remedial Action Work Plan.</p> |

| L        | 3           | Sect. 1.2<br>page 1-3<br>4 <sup>th</sup> paragraph<br><br>and<br><br>Sect. 2.12<br>page 2-33. | <p>Declaration / Decision Summary</p> <p>DOE has established a new term, “restricted recreational” due to the fish advisory established by TDEC for the entirety of Bear Creek (from its headwaters to its mouth) as a result of mercury contaminated fish resulting from ORR releases. Reclassification of the state recreational use designation cannot be accomplished through a CERCLA ROD. While DOE may develop nomenclature as it wishes for its internal land use designation purposes, please note that the fish advisory does not change the use of Bear Creek as designated by the state’s stream classifications in TDEC 0400-40-04-.09 <i>Use Classifications for Surface Water</i>. Notably, recreational use is intended to support “recreation in and on the waters including the safe consumption of fish and shellfish” (TDEC 0400-40-03-.02(2)), even where there is a fish advisory to protect the public while the surface waters are restored from damage due to legacy contamination. No discharges to surface water that are part of a CERCLA remedial action are allowed if the ROD does not provide for compliance with the applicable requirements of CWA or regulations promulgated under CWA (40 CFR 122.4(a)) or if the action will cause or contribute to a violation of a water quality standard (40 CFR 122.4(i)). Please revise the language to clarify that Tennessee’s designated use classifications for Bear Creek includes Recreation. Attainment of AWQC, narrative criteria and AWQC equivalents for radionuclides is required throughout the stream pursuant to CWA and TDEC water quality standards regulations identified as ARARs. DOE’s access restrictions (suppression of recreational use) should not be factored into derivation of AWQC equivalents for radionuclides.<sup>5</sup></p> <p><sup>5</sup> Guidance for Conducting Fish Consumption Surveys, December 2016. Suppression is defined to include the reduction in consumption due to environmental or other factors (e.g., fears of chemical contamination in fish, fish populations of inadequate size to support consumption, loss of access to fisheries...), at p. vi.</p> | <p>Clarification provided. The “restricted recreational” terminology DOE has applied has been used for ETPP CERCLA cleanup as a land use control that allows some limited recreational activity on property, and it is not new. It is <b>land</b> designation only in this case as well, and does not in any way refer to waters of the state. Rather it is an acknowledgement that although DOE intends to use the land for its future missions (see response to General Comment 8), hunting of certain game is at times controlled and allowed in the area under DOE oversight (hence the use of the word restricted). No other activities (e.g., fishing or any other recreational activity) are allowed in Bear Creek Valley per DOE property <i>No Trespassing</i> ordinances. Nonetheless, DOE acknowledges the State’s classification for uses in Bear Creek and its tributaries (e.g., recreational) for setting goals for the remedy. The text was reviewed and modified to clarify the position.</p> |
| L        | 4           | Sect. 1.2<br>page 1-3<br>3rd and 4th<br>paragraph                                             | <p>STATEMENT OF BASIS AND PURPOSE</p> <p>Land use controls (i.e., the land use Zones) are not considered part of the basis for selecting a remedy, rather land use controls may be a component of a remedy to maintain the long-term protectiveness of a selected remedy. Further, DOE land use zone and institutional controls do not change the state's designated use of the creek (recreational).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Agree. Text changes have been made throughout document regarding land use to clarify the terminology.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| L        | 5           | Sect. 1.2<br>page 1-3<br>4 <sup>th</sup> paragraph | <p>STATEMENT OF BASIS AND PURPOSE</p> <p>The text states:</p> <p>Additionally, BCV from Highway 95 east to the Y-12 National Security Complex (areas including Zones 1, 2, and 3) is within DOE-posted No Trespassing property limits; therefore, although portions of this property are open for recreational hunting (turkey and deer) at limited times, fishing is never allowed, and is prohibited within the whole Bear Creek Watershed.</p> <p>The entire watershed is not restricted, and this needs to be clarified in the revised ROD. Further, remediation goals must protect Bear Creek for its designated use (recreational) per state regulations.</p>                                                                                                                                                                                               | Agree. Text has been modified and the phrase “whole BC watershed” was removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| L        | 6           | Sect. 1.2<br>p. 1-4                                | <p>STATEMENT OF BASIS AND PURPOSE</p> <p>The language in the ROD states, “To further discourage the possibility of fishing in Bear Creek, beavers and their habitat, which cause pooling that could enhance fishing, are removed (as necessary) as a best management practice.” Please confirm the statement that the beavers and their habitat are removed to discourage fishing (as opposed to removing possible sites of mercury methylation). In addition, if this is, in fact, the purpose, please indicate whether such habitat alteration is a “best management” practice under TDEC water quality standards regulations and/or the Clean Water Act. Alterations to surface water that would discourage and inhibit the development of healthy fish populations seems counter to the purposes of the Clean Water Act and TDEC water quality standards.</p> | Clarification provided. The referenced sentence was removed from both Sects. 1.2 and 2.12 because it is not part of the remedy. Also note, almost all beaver dams in Bear Creek Valley east of State Route 95 were removed naturally by the high surface water flows resulting from very wet winters in recent years.                                                                                                                                                                                                                 |
| E        | 7           | Sect. 1.2<br>p. 1-4<br>4 <sup>th</sup> paragraph   | Please add language to reflect that EPA has not approved the RI/FS for the EMDF landfill due to multiple issues that were not resolved by the December 7, 2017, dispute resolution agreement (DRA) signed by the FFA Senior Executive Committee. The only part of the RI/FS that EPA agreed to was Appendix G, ARARs, which was attached to the DRA. Appendix G provided the legal framework for the siting, design, construction, operation, and closure of the landfill, as well as a discussion of those legal requirements that the landfill would not meet. It also provided the information (including design elements of the proposed EMDF) that DOE was proposing to support a waiver of those legal requirements.                                                                                                                                        | <p>Agree. Text was added:</p> <p>Although the RI/FS (D5 version) was not formally approved by EPA or TDEC, the three agencies agreed to move forward with the Proposed Plan. On December 7, 2017, a formal dispute agreement was entered into by the three parties, which addressed the issues of siting, applicable or relevant and appropriate requirements, and waste acceptance criteria, and concurred on submitting a Proposed Plan that would identify the CBCV as the preferred location for an onsite disposal facility.</p> |

| P        | 8           | Sect. 1.2<br>p. 1-4<br>6 <sup>th</sup> paragraph | <p>Declaration. This paragraph discusses the public comment period. It should be noted that at least two elements of the Administrative Record were not complete at the time that the public comment period was held. In addition to the RI/FS (discussed in comment above), Tech Memo 2,<sup>6</sup> which provided additional “wet weather” groundwater elevation information, was not complete until after the Proposed Plan was published for public comment and therefore represented a gap in the Administrative Record at the time that the Proposed Plan was published. An additional and significant gap in the Administrative Record is the lack of an approved Wastewater FFS, which should have included preliminary remedial goals (PRGs) for the discharge of wastewater. This gap in the Administrative Record should be addressed consistent with the <i>community relations to support the selection of remedy</i> requirements at 40 CFR § 300.430(f)(3).<sup>7</sup> Because the only public comment period was before the finalization of Tech Memo 2 and the Revised FFS, it can be argued that the public has not had a “reasonable opportunity” to submit comments on the proposed plan, “including the RI/FS.”<sup>8</sup> So, while remedy decision making should “factor[] in any new information or points of view expressed by the state (or support agency) and community during the public comment period,”<sup>9</sup> the public has not had an opportunity to comment on a landfill based on a higher-than-projected water table or PRGs for the discharge of landfill wastewater into surface water, including but not limited to Bear Creek. EPA expects DOE to accept public comment on the aforementioned information, and incorporate comments and responses in the final ROD.</p> <p><sup>6</sup> Tech Memo 1 provided “dry weather” information about groundwater elevations in the location of the proposed site (Site 7c).</p> <p><sup>7</sup> (“Provide a reasonable opportunity, no less than 30 calendar days, for submission of written and oral comments on the proposed plan and the supporting analysis and information located in the information repository, including the RI/FS.”) Under either 40 CFR 300.430(f)(3)(i)(C) or 40 CFR 300.430(f)(3)(ii)(B).</p> <p><sup>8</sup> In this case, DOE proposed to remove the wastewater component of the action from the RI/FS and to place it into an FFS, so there is an FFS as well as an RI/FS that the public should be able to review in commenting on the proposed remedial action.</p> <p><sup>9</sup> 40 CFR § 300.430(f)(4)(1).</p> | <p>Clarification provided. With submittal of the D1 ROD, the FFA parties have recommended additional public engagement. That effort allows for additional public comment, and responses to additional comments are addressed either within the D2 ROD.</p> |

| D        | 10          | Sect. 1.2<br>p. 1-4<br>7 <sup>th</sup> paragraph | <p>Declaration.</p> <p>This paragraph states that the selected alternative meets the threshold criteria that the action “(1) be protective of human health and the environment, (2) attain those applicable or relevant and appropriate requirements (ARARs)...” The ROD makes this assertion without a factual record to support it, that is, because the ROD does not identify cleanup levels such as ambient water quality criteria equivalents for radionuclides or the discharge limits that will be protective of those criteria, it is not clear that this action does, in fact, meet those threshold requirements.<sup>10</sup> Without having those criteria or limits, especially given DOE’s calculations provided in the D3 (not final) FFS, a determination cannot be made that the remedy is protective or meets the state relevant and appropriate requirement that <i>Recreation Use</i> AWQCs for carcinogenic pollutants protective for fish consumption are to be developed at a 10E-5 level of risk (TDEC 0400-40-03-.03(4)(j) FN(c)). EPA is aware that AWQC-equivalents for radionuclides are being developed and the FFS is being revised. Once approved in the FFS, water quality values for radionuclides must be incorporated in the final ROD.</p> <p><sup>10</sup> ROD p. 2-45 merely states, “All discharge water from EMDF will be treated as necessary to meet the most stringent applicable instream water quality criteria, including recreational, with consideration of the stream mixing zone at the point of discharge.”</p> | See response to General Comments 1 and 9.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| D        | 11          | Sect. 1.2<br>p. 1-4<br>7 <sup>th</sup> paragraph | <p>Declaration</p> <p>This paragraph states that the statutory preference for treatment will be addressed in the waste generation RODs. There is no exception for the application of this CERCLA preference to a selected remedy. While much of the preference may not be relevant to the operation of the landfill, certainly the wastewater, as a waste stream generated in this remedial action, should satisfy this preference. Please explain whether at least this component of the remedy satisfies the CERCLA statutory preference for treatment “which permanently and significantly reduces the volume, toxicity or mobility of the hazardous substances, pollutants, and contaminants,” since these actions are to be preferred over remedial actions not involving such treatment. Revise the ROD language accordingly to specify how this statutory preference is satisfied by this remedy (not other CERCLA response actions).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Agree. The following was added to the end of the 7<sup>th</sup> paragraph: “CERCLA’s preference for treatment is also addressed by active treatment of landfill wastewater generated at the site to minimize contaminant transport to downstream receptors.”</p> <p>Note: as agreed, the reduction in contaminant mobility achieved by waste compaction and placement in a landfill with multi-layer liner and final cover systems is not credited.</p> |

| D        | 12          | Sect. 1.3<br>p. 1-5<br>1 <sup>st</sup> paragraph   | <p>Declaration</p> <p>The first sentence states that the remedial action “protects the public health and the environment from actual or threatened releases of hazardous substances...” Without having approved radionuclide AWQCs from the Revised Wastewater FFS to incorporated into the ROD and no ROD cleanup levels (i.e., effluent limits) for the discharge of radiological hazardous substances into Bear Creek (or another location, which has apparently not been located), it is premature to assert that the remedy is protective of human health and the environment. Based on effluent limits in the as-yet-unapproved D3 FFS, however, the calculated limits are based on exposures other than recreational use of Bear Creek (including fish consumption) as understood under the Clean Water Act and TDEC water quality standards and were outside EPA’s generally accepted risk-range for carcinogens. EPA is aware that AWQC-equivalents for radionuclides are being developed and the FFS is being revised. Once approved in the FFS, water quality values for radionuclides must be incorporated in the final ROD.</p> | See response to General Comment 1.                                                                                                                                                       |
| E        | 13          | Sect. 1.3<br>p. 1-5                                | <p>ASSESSMENT OF THE SITE</p> <p>The text should state that the selected remedy will meet the remedial action objectives (RAOs) both during the operational period of the landfill and after the landfill is closed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Agree. Text was modified to:</p> <p>The selected remedy will meet the remedial action objectives (RAOs) during operation, as well as following closure, as described below:</p>       |
| E        | 14          | Sect. 1.3<br>p. 1-5<br>and<br>Sect. 2.8<br>p. 2-17 | <p>ASSESSMENT OF THE SITE/Remedial Action Objectives</p> <p>The RAO definition states: “Maintain a 15-ft separation between the bottom of emplaced waste and the seasonal high-water table of the uppermost unconfined aquifer, which includes 5 ft of liner system and 10 ft of geologic buffer consistent with TDEC 0400-11-01-.04(4)(a)(2)”. Please add to the start of the sentence, “To protect groundwater, DOE shall...”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Disagree. This RAO was developed by the three parties, in consultation. The RAO not only protects GW, but thereby protects the receptor as well. There is no need to change the wording. |

|----------|-------------|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| W        | 15          | Sect. 1.3<br>p. 1-5<br>1 <sup>st</sup> paragraph<br>RAO bullets | There is an insufficient factual record to support the assertions in the first three bullets, which claim that people, the water resources, and ecological receptors would be protected by meeting identified ARARs, especially considering that DOE has not included all of the ARARs identified by EPA and that DOE appears to be following the NRC dose-based approach for protection of the public from surface water pathway and therefore is not complying with the most stringent ARAR for developing and measuring effluent limits for discharges of radionuclides. Please address these deficiencies in the revised ROA. | Disagree. The ROD has been modified to include the ARARs the comment is speaking of. The specific remediation goals for landfill wastewater are specified in the D2 ROD (Sect. 2.12.2.4). The approach was agreed upon among the FFA parties. The discharge limits will be developed in the future, based on the remediation goals, when the specifics of the EMDF landfill wastewater treatment systems are known, including the discharge location. The remediation goals and future discharge limits are within the CERCLA risk range and protective of Human Health and the Environment. No changes to the RAOs are necessary. |
| L        | 16          | Sect. 1.4<br>p. 1-5                                             | DESCRIPTION OF THE SELECTED REMEDY<br><br>These sections discuss land use changes. DOE's land use changes do not affect Tennessee's recreation use classification, and the entire water body must still meet CERCLA excess lifetime risk of cancer of 10E-5 based on fish consumption in a recreational use scenario. This needs to be clarified in the text.                                                                                                                                                                                                                                                                     | Agree. The following text was added to the last bullet in Sect. 1.4: "The land use changes do not affect the surface water use classification."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Category            | Comment No. | Sect/<br>Page       | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Response                                                                                                                                                                                                     |

| E        | 19          | Sect. 1.5<br>p. 1-7 | STATUTORY DETERMINATIONS Add text that states the selected remedy was determined in the ROD to provide the best balance of tradeoffs among the alternatives with respect to the balancing criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Agree. Text revised to read: “The selected remedy is protective of human health and the environment, is cost effective, and uses permanent solutions and alternative treatment technologies to the maximum extent practicable. The selected remedy provides the best balance of tradeoffs among the alternatives with respect to the balancing criteria considered.”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| T        | 20          | Sect. 1.5<br>p. 1-7 | <p>Declaration</p> <p>The second sentence states that there is no principal threat waste to be addressed as part of this action. DOE's calculation of effluent limits and screening level effluent limits in the D3 Revised FFS would result in concentrations of radionuclides in the effluent that are at a level of risk exceeding (10-3) that EPA would generally find to reflect principal threat waste for direct exposure. Once DOE has revised the Wastewater FFS and ROD to include AWQC equivalent and effluent limits that meet all the ARARs (including the most stringent CWA and TDEC water quality standard regulations), this should be an accurate statement.</p> | <p>Clarification provided. The determination of whether source materials present at a unit would be classified as Principal Threat Waste (PTW) is based principally on EPA 1991. In this guidance, EPA defines principal threat wastes as those materials that have a high toxicity or mobility and cannot be reliably contained or present significant risk to human health or the environment. They include liquids and other highly mobile materials (e.g., materials that are released from surface soil due to volatilization, leaching, or surface runoff) or materials having high concentrations of toxic compounds.</p> <p>Principal threat waste was identified in the Phase 1 Upper East Fork Poplar Creek Interim ROD as some soils/sediments contaminated with mercury. From that Phase 1 ROD (<i>DOE/OR/01-1951&amp;D3</i>):</p> <ul style="list-style-type: none"> <li>• “The remedy addresses mercury-contaminated soils, sediments, and groundwater, which contribute to contamination of surface water within UEFPC CA.” p.1-1</li> <li>• “The principal threat wastes identified under this remedial decision include (1) the WEMA (soils in the immediate vicinity; storm sewers; and shallow groundwater captured by currently operating sumps), (2) sediment in exposed portions of the UEFPC stream channel, and (3) sediment within Lake Reality.” p.2-78</li> </ul> <p>However, per the mercury negotiations and agreements</p> |

|          |             |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                          | reached by the FFA parties, no D009 mercury hazardous waste will be disposed of in the EMDF and no liquids are accepted for disposal (e.g., elemental liquid mercury). Therefore, there is no PTW destined for disposal in the EMDF.<br><br>EPA 1991. <i>A Guide to Principal Threat and Low Level Threat Wastes</i> . OSWER Superfund Publication 9380.3-06FS. November 1991.                                               |
| T        | 21          | Sect. 1.5<br>p. 1-7   | Declaration<br><br>The third sentence states that the action meets all ARARs. This statement is not currently supported by a factual record (in the FFS currently under revision or in this ROD). Once the FFS and ROD have been revised and approved per these comments, that should be an accurate statement.                                                                                                                          | Noted.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| E        | 22          | Sect. 1.6<br>p. 1-8   | Declaration<br><br>The last sentence states that the Administrative Record contains information approved by the three FFA parties. Note that EPA has not approved the RI/FS or a Revised Wastewater FFS for the EMDF landfill. This statement should be revised to accurately reflect the facts related to EPA approval (or not) of Primary Documents that are part of the EMDF Administrative Record file and support remedy selection. | Clarification provided. The statement is not saying that all information in the administrative record has been approved by EPA; rather it is stating that the administrative record itself has been approved by EPA. The text has been clarified as follows:<br><br>Additional information regarding EMDF can be found in the Administrative Record, which was generated and approved by the three FFA parties for this ROD. |
| E        | 23          | Fig. 2<br>p. 2-5      | Land use (from Phase I Bear Creek Valley ROD) and disposal sites evaluated in Bear Creek Valley<br><br>The outlines for Site 7A and Site 7C overlap. Please make changes to the outlines that will allow the reader to clearly differentiate between the two proposed locations for the EMDF.                                                                                                                                            | Agree. Figure 2.3 has been revised to more clearly differentiate between Sites 7a and 7c.                                                                                                                                                                                                                                                                                                                                    |
| S        | 24          | Sect. 2.2.1<br>p. 2-7 | Previous Investigations and Data Sources<br><br>“Results of the Phase 1 site characterization confirmed the acceptability of the CBCV site for a new, low level (radioactive) waste (LLW) landfill and support final site selection.” When was this completed and where are the results of this study? Are they in the Administrative Record? Provide document names and approval dates in the ROD.                                      | Agree. Text was added as follows:<br><br>“Results of the Phase 1 characterization are provided in the following secondary documents that are in the Administrative Record:<br><br><ul style="list-style-type: none"> <li>• Technical Memorandum #1, Environmental Management Disposal Facility Phase 1 Field Sampling Results Oak Ridge, Tennessee (DOE 2018c)</li> </ul>                                                    |

|          |             |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <ul style="list-style-type: none"> <li>Technical Memorandum #2, Environmental Management Disposal Facility Phase 1 Monitoring, Oak Ridge, Tennessee (DOE 2019)”</li> </ul> Secondary documents do not require approval.                                                                                                                                                                                                                                                          |
| E        | 25          | Sect. 2.2.1<br>p. 2-8 | <p>Previous Investigations and Data Sources</p> <p>Based on the topography shown on Figure 2.3 (Phase I characterization and site characteristics of the EMDF site), it is unclear if the outside perimeter of the Environmental Management Disposal Facility (EMDF) landfill is sufficiently set back to allow for the engineered perimeter structures, such as mechanically stabilized earth walls or similar structures, needed to grade the site to the top of the geologic buffer. This is of particular note given the locations of streams NT-10 and NT-11, as shown on Figure 2.5 (EMDF conceptual site layout). Revise the ROD text to clarify if the outside perimeter of the EMDF landfill is sufficiently set back to allow for the engineered perimeter structures needed to grade the site to the top of the geologic buffer.</p>                                                                                                                                                                                             | <p>Clarification provided. The EMDF boundary presented in Fig. 2.4 represents a conceptual design/layout and not the precise location of the landfill features. The final design will accommodate both the geologic buffer and engineered perimeter structures. The final design, including the more precise location and detailed design information, will be presented in the Remedial Design Report for approval by the FFA parties. No change to this text is necessary.</p> |
| S        | 26          | Sect. 2.2.1<br>p. 2-9 | <p>Previous Investigations and Data Sources</p> <p>"Per the first formal Dispute Resolution Agreement between DOE, EPA, and TDEC in December 2017, the results and analysis of the field investigation, including the first 2 months of monitoring, were placed in the Administrative Record and were available during the Proposed Plan public comment period (DOE 2018c). The entire year long monitoring results are documented in a second Technical Memorandum (DOE 2019), also included in the Administrative Record." Was any new information found through the 2019 effort that had an impact on the remedy selected or its implementability? Include in the ROD, a summary of the findings in Technical Memorandum 1 and 2. These documents provide information that enhances the characterization for Site 7c. Add information about the anticipated post-ROD groundwater field study. EPA expects this information to be shared with the public in the upcoming public engagement activities, and included in the final ROD.</p> | <p>Disagree. The information collected to date has not had a major impact on the implementability of the remedy. A minor change of the eastern boundary is documented in Sect. 2.14. A summary of the investigation results was already in this section. References to the TMs were added to the ROD. Information on the anticipated post-ROD groundwater field study is already provided in Sect. 2.14.3.</p>                                                                   |

|----------|-------------|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E        | 27          | Sect. 2.3<br>p. 2-9                               | <p>Decision Summary</p> <p>In the first paragraph, DOE states that it has surpassed CERLCA requirements for public engagement. This does not appear to be accurate, since it is not clear that the NCP requirements at 40 CFR § 300.430(f)(3), have been met. See comment on Decision Summary Section 2.10.9 below. EPA is aware that additional public engagement is being planned, and once completed, it may be accurate to state that CERCLA requirements for public engagement have been met. EPA advises against the term “surpassed” in favor of the term “met”.</p> | Agree. Text was changed to say “met”.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| P        | 28          | Sect. 2.3<br>p. 2-10<br>2 <sup>nd</sup> paragraph | <p>Highlights of Community Participation</p> <p>Please modify the text to explain why DOE did not conduct specific outreach efforts with residents of the Country Club Estates, a community close to the Proposed Site. Also, please include the venue(s) where the Scarboro meetings were held on the dates referenced.</p>                                                                                                                                                                                                                                                | <p>Agree. The following text was added:</p> <p>“No specific meetings or discussions were held with residents of the Country Club Estates (community that is closest to the proposed location) as they did not request one nor express a concern.”</p> <p>The venues included meetings at various locations in the Scarboro community, New Hope Center, and at local businesses. As part of these discussions, tours to EMWMF and the proposed site were given. The information has been added to the document.</p> |
| P        | 29          | Sect. 2.3<br>p. 2-10<br>3 <sup>rd</sup> paragraph | <p>Highlights of Community Participation</p> <p>The approved DOE 2016 Public Involvement Plan (PIP) states that DOE will utilize all media outlets, e.g., radio and television, to communicate the availability of CERCLA decision documents, public comment periods and public meetings. Was this done for the EMDF and will it be followed for future public information for the EMFD? Please clarify text to address these issues.</p>                                                                                                                                   | <p>Clarification provided. Text was added to note that DOE placed notices in all the local papers, highlighted dates and times on social media accounts, and sent mailers to all 15,000 households in Oak Ridge. DOE also discussed the EMDF project and comment period at the SSAB’s monthly board meeting – which airs on the public access channel (Channel 12- Community Television of Knoxville).</p> <p>Additional public information was announced based on an agreed-upon approach by the FFA parties.</p> |

| E        | 34          | Sect. 2.4<br>p. 2-11<br>5 <sup>th</sup> paragraph | <p><b>SCOPE AND ROLE OF THE ACTION</b></p> <p>“The scope of the action is to provide for disposal of CERCLA waste generated from the cleanup...If at some future time. DOE CERCLA waste...” What criteria will be used regarding CERCLA waste generated within the state that can be disposed at the on-site waste treatment unit? Need to consider how CERCLA offsite rule may impede the ability to retrieve ORR waste from offsite locations. More details are needed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Clarification provided. The text has been revised to indicate the ROD only permits wastes generated by CERCLA activities on the Oak Ridge Reservation (USDOE) NPL site to be disposed of in EMDF. However, the FFA parties, using the CERCLA process, could agree and approve to take any waste generated by past DOE activities off-ORR, but within the state of Tennessee.</p> |
| E        | 35          | Sect. 2.4<br>p. 2-11                              | <p><b>Decision Summary</b></p> <p>The fifth paragraph states, “If at some future time DOE CERCLA waste from original Oak Ridge NPL Site activities is generated within the state that requires disposal, and it is determined by the FFA parties that EMDF is the appropriate place for disposal, then the FFA parties will agree that those waste streams may be disposed of within EMDF consistent with the project-specific Waste Handling Plan.” Please revise this statement to reflect that disposal decisions for CERCLA waste located off the ORR will be made in a remedy selection document reviewed and approved by the FFA parties consistent with the FFA requirements and may include issuance of a Proposed Plan as part of the remedy selection consistent with NCP requirements. Please create a table listing <b>all</b> known areas offsite from the DOE-ORR that might be subject to a CERCLA removal action in the future consistent with the text above.</p>                                                                                                       | <p>See response to Specific Comment 34.</p> <p>Clarification provided. There are no known such sites at this time.</p>                                                                                                                                                                                                                                                              |
| L        | 36          | Sect. 2.4<br>p. 2-11                              | <p><b>SCOPE AND ROLE OF THE ACTION</b> The text states: “The selection of the remedial action involving onsite disposal at EMDF in BCV is consistent with the recommendations made by EUWG; however, the EUWG recommendation favored those areas already contaminated...” This statement does not reflect the EUWG recommendation, which specifically identifies CBCV within Zone 2. Suggested text: “Notwithstanding the EUWG recommendation favoring placement of long-term waste disposal facilities in areas already contaminated or near areas of contamination.” The text also states that “for a variety of technical reasons discussed under Sect. 2.12.1, the FFA parties believe that CBCV is the preferred location for the landfill.” However, review of Section 2.12.1 does not find technical reasons that explain the preference for CBCV over other sites considered. In general, the ROD doesn’t explain the reasons that CBCV site is preferred over other options for onsite disposal. Please add text to justify why here is a preference for the CBCV location.</p> | <p>Agree. The text changes as indicated have been made.</p> <p>The term “technical” was removed; please note, however, six bullets in Sect. 2.12.1 state reasons why the CBCV site is preferred. Additional reasons were added as well.</p>                                                                                                                                         |

| Category | Comment No. | Sect/<br>Page                           | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| T        | 37          | Sect. 2.4<br>p. 2-11                    | <p>Decision Summary</p> <p>The last paragraph states that DOE has completed the required public review and comment. EPA is aware that additional public review and comment is being planned, and that the D3 Wastewater FFS is being revised for approval. Upon completion of those activities, this statement may be accurate. The next draft of the ROD will be reviewed accordingly.</p>                                                                                                                                                                                                                                                                                                                                       | No response required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| E        | 38          | Sect. 2.5.3 and<br>Fig. 2.3<br>pg. 2-13 | Though the text refers to drainage feature D-11 East, the figure does not include drainage feature D-11 East. (None of the figures include D-11 East.) Please update the appropriate figures to include D-11 East.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Clarification provided. D-11 East label has been added to the figure (now Fig. 2.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| S        | 39          | Sect. 2.5.2<br>p. 2-13                  | <p>Groundwater</p> <p>The text refers to the absence of strike-parallel groundwater contamination in the Nolichucky Shale and Maryville Limestone around the Bear Creek Burial Grounds (BCBG). As noted in prior Remediation Effectiveness Reports and commented upon by EPA, there is an absence of groundwater monitoring in critical areas of the outcrop belts of these formations to the west of the BCBG. Thus, it is inappropriate to cite the groundwater conditions around the BCBG as supporting some conclusion or inference that groundwater contamination would not likely migrate along strike in these formations to the west of the EMDF area. Update the text to reflect this probably groundwater flowpath.</p> | <p>Agree. The text has been revised as follows: “The configuration of the groundwater VOC plume emanating from the Bear Creek Burial Grounds (BCBG) is notable because parts of its footprint occur along the geologic strike of parts of the EMDF site footprint in CBCV (within the outcrop belts of the Maryville Formation and Nolichucky Shale). <del>however, the VOC plume emanating from BCBG indicates downgradient, southerly contaminant migration toward Bear Creek and not along strike in the less permeable Maryville and Nolichucky Formations.</del> The VOC plume then commingles with plumes emanating from source areas further upstream, which follow strike-dominant flow in the Maynardville Limestone and surface water flow along Bear Creek toward the southwest. <del>The current BCBG groundwater contamination plume configuration confirms that groundwater flows from the ridge towards Bear Creek and does not flow laterally across the tributaries.</del></p> |

|----------|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| S        | 40          | Sect. 2.5.3<br>p. 2-13 | <p>Surface Water</p> <p>The second paragraph of Section 2.5.3 should add an explanation for the losing character of the streams. A losing stream implies a karst condition which is inconsistent with the characterization of the EMDF setting presented in Section 2.5.1.</p> | <p>Agree. Streams are either losing or gaining regardless of the formation crossed and are dependent on groundwater elevations related to surface topography in the area of the stream (streams with groundwater elevations higher than stream channels are typically gaining streams, streams with groundwater elevations lower than stream channels are typically losing streams).</p> <p>However, the text contained general language about tributaries across the ORR and was not specific to the EMDF site. The text was revised as follows to be specific to the EMDF:</p> <p>“Stream flow is primarily a result of precipitation events and from subsequent shallow seeps with limited flow or dry stream conditions during the summer months. Shallow soil can act as a stormflow layer when flow is present, with surface water transport through macropores that emerge as visible flow further downstream (DOE 2019). Meandering stream channels filled with sediments are present upstream of the Haul Road culverts, and are not typical of other higher gradient streams found across the ORR.”</p> |
| E        | 41          | Sect. 2.5.4<br>p. 2-14 | <p>Ecological Resources</p> <p>Please describe the area of the wetland delineation study and indicate it in a figure. It is variously referred to as “a broader area” and “expanded study area” but details regarding the area is not presented in a figure.</p>               | <p>Clarification provided. The area included in the wetland delineation study is approximately between NT-9 and N-11, and from the northern edge of the EMDF project to Bear Creek. The text has been revised as follows:</p> <p>“A detailed wetland delineation study was performed (ORNL 2018) that confirmed the presence of wetland areas previously identified, delineated their boundaries, and expanded the study area to allow evaluation of impacts over a broader area than reported on in the RI/FS. The expanded study area included NT-9, NT-11, and Bear Creek (ORNL 2018).”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Category | Comment No. | Sect/<br>Page                                       | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Response                                                                                                                                                                                                                                                                                                      |
|----------|-------------|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E        | 42          | Sect. 2.5.4<br>p. 2-14                              | <p>Ecological Resources</p> <p>There is no discussion of the anticipated or potential impacts to the Bear Creek riparian system. Will tree clearing for the landfill impact the creek (loss of shade, erosion, siltation, etc)? How will additional stormwater due to land clearing impact Bear Creek? How will construction activities, rerouting the roads, etc., impact Bear Creek?</p>                                                                                                                                                                                                                                                                               | <p>Clarification provided. No impacts to Bear Creek are foreseen. The landfill will not border the creek. Stormwater will be controlled to be consistent with current stormflow rates released to Bear Creek. Construction activities will be performed per the ARARs to ensure protection of Bear Creek.</p> |
| E        | 43          | Sect. 2.5.4<br>p. 2-14<br>2 <sup>nd</sup> paragraph | <p>Ecological Resources</p> <p>Irrespective of observing no Tennessee dace in the tributary streams at the CBCV, the impact on the Tennessee dace population from the EMDF construction through operation should be addressed in this section.</p>                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Clarification provided. The Tennessee dace population is not impacted by EMDF construction through operations. Stormwater flow rates will be managed and controlled and sediment loading will be managed per ARARs Therefore, no explanation is required.</p>                                              |
| E        | 44          | Sect. 2.5.4<br>p. 2-14                              | <p>Decision Summary</p> <p>The third paragraph states that there are three federally listed endangered bat species living in or near the CBCV site. Please confirm that the consultation with U.S. Fish &amp; Wildlife Service required under Section 7 of the Endangered Species Act has been completed. The consultation requirement is cited as part of a Location-specific ARAR, so it is presumed that it has or will be completed, but it should be completed in a time frame that allows for the Secretary of FWS to render an opinion, which may suggest an action other than the one proposed by the federal agency (DOE). Clarify this in the revised ROD.</p> | <p>Clarification provided. Potential impacts and mitigation will be identified and performed as part of the follow-on primary documents.</p>                                                                                                                                                                  |
| E        | 45          | Sect. 2.5.5<br>p. 2-15                              | <p>Cultural Resources</p> <p>Section 2.5.5 indicates that DOE intends to avoid the Douglas Chapel Cemetery and preserve it in-situ as well as maintain access to the cemetery for visitors; however, this is not conveyed on Figure 2.5 (EMDF conceptual site layout). Specifically, no rerouted roads to the cemetery are shown. Revise the ROD to clarify how access to the Douglas Chapel Cemetery will be maintained for visitors given the proximity of the cemetery to the EMDF, borrow area, and support facility, shown on Figure 2.5.</p>                                                                                                                       | <p>Clarification provided. A road to the Douglas Chapel Cemetery is planned and will be included in the final design that will be provided to EPA and TDEC for review and approval.</p>                                                                                                                       |

|----------|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E        | 46          | Sect. 2.5.5<br>p. 2-15 | Cultural Resources<br><br>“Because of their limited research potential, no further work was recommended at these five sites. The sites were recommended not eligible for inclusion in the National Register of Historic Places.” Although the archeological/historic artifacts were deemed not eligible for inclusion of the National Register of Historic Places, please clarify how the archeological/historic artifacts will be handled during construction activity in the event that additional artifacts are discovered. Who will be involved as part of process? Is there a contingency plan in the event that additional artifacts are encountered during construction phase? Revise text to answer these questions. | Clarification provided. EMDF construction will be conducted in accordance with UCOR PPD-EC-3193, <i>National Historic Preservation Act Program Description for UCOR LLC, an Amentum-Led Partnership With Jacobs</i> , or its equivalent. This document describes the steps to be taken if an unexpected object is encountered, including halting work at that location until the object is evaluated. These requirements are flowed down through the work control process, without regard to whether the site is part of a historic property. |
| L        | 47          | Sect. 2.6<br>p. 2-16   | CURRENT AND ANTICIPATED LAND USES<br><br>“While the EUWG Stakeholder Report on Stewardship (DOE 1998b) included recommendations on the end use of BCV and for siting an onsite CERCLA water disposal facility, there are no formal land use plans for ORR.” How are the designations established without a formal land use plan? Please explain.                                                                                                                                                                                                                                                                                                                                                                             | Clarification provided. See response to General Comment 8.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| L        | 48          | Sect. 2.6<br>p. 2-16   | CURRENT AND ANTICIPATED LAND USES<br><br>Per the LUC Checklist #2, in Section 2.6 please include current and anticipated land uses for Zone 1, 2, and 3. Revise the text to define the different zones and identify any prohibited uses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Clarification provided. See response to General Comment 8.<br><br>Text was also added to address Zone 2 revisions made based on locating the EMDF in Zone 2, and a table was added addressing the remediation goals associated with the zones.                                                                                                                                                                                                                                                                                                |
| L        | 49          | Sect. 2.6.1<br>p. 2-16 | Current Land Use<br><br>Description of land use. This section says that DOE is modifying the land use but does not clearly specify the new land use. Please clarify in the ROD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Clarification provided. | D        | 51          | Sect. 2.7<br>p. 2-16 | <p>SUMMARY OF SITE RISKS</p> <p>TDEC has classified Bear Creek as having a fishable/swimmable goal. Bear Creek is CWA 303(d) listed for not currently achieving its designated uses on account of PCBs, cadmium and mercury. The creek lacks additional capacity to take on increased discharges of pollutants. The ROD should discuss how CWA and TDEC 0400.40.03 were considered in the selection of the remedy.</p> | <p>Clarification provided. As described in Sect. 2.12.2.5, the EMDF design includes a wastewater treatment facility and monitoring of discharges for this purpose.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| E        | 52          | Sect. 2.7<br>p. 2-16 | <p>SUMMARY OF SITE RISKS</p> <p>Please discuss the risks to human health and ecological risk from potential landfill discharges to surface water, groundwater, and air.</p>                                                                                                                                                                                                                                            | <p>Agree. The following text was added:</p> <p>“Consolidation of the waste at the EMDF from multiple cleanup projects across the ORR will result in mobility of hazardous substances, pollutants, and contaminants by placement in a landfill with multi-layer liner and final cover systems. This consolidation will also result in minor risks to human health and the environment during the operational period through release of treated wastewater to surface water; however, the risk is controlled to within acceptable limits since the wastewater will be treated to remove the majority of contaminants per CWA ARARs. Releases to air are minor; no measurable risk has been recorded to date at the existing facility (EMWMF), as documented in the annual Phased Construction Completion Reports (PCCRs) for that facility (all reports may be found at the DOE Information Center: <a href="https://doeic.science.energy.gov/">https://doeic.science.energy.gov/</a>). Long-term risk from releases to groundwater and surface water as the facility ages are controlled to within the CERCLA risk range via defense in depth: facility design and features, WAC, monitoring, and institutional controls (see Sect. 2.12.2). Carcinogenic risk posed by estimated contaminants to be left in place at closure are shown to be protective to the CERCLA risk range for the exposures described above, thus meeting the RAOs.”</p> |

| D        | 53          | Sect. 2.8<br>p. 2-17 | <p>Decision Summary</p> <p>This text repeats text in the Declaration, Section 1.3, page 1-5, first paragraph, bullets. There is an insufficient factual record to support the assertions in the first three bullets, which claim that the remedial action objectives, that is, protection of people, the water resources, and ecological receptors, would be met by meeting ARARs. There is an insufficient record to support an assertion that all ARARs will be met. For instance, the requirement at TDEC 0400-40-04(4)(j) FN(c) requires that AWQCs be developed at a 10E-5 level of risk. Neither the ROD nor the FFS contain calculated AWQCs for radionuclides that may be contained in the landfill wastewater and discharged from the landfill. The “effluent limits” or “screening level effluent limits” in the old D3 Wastewater FFS clearly do not meet that level of risk for the designated use of recreation because DOE’s calculations are based on exposure inputs which results in an ingestion rate (e.g., one day a year for fishing) that does not appear to have a scientific basis and is not consistent with exposure assumptions used by TDEC for establishing AWQCs for pollutants that are protective for fish consumption. While the ROD does not contain limits based on those inputs, the record established in the old D3 FFS does not support DOE’s statements that the remedy will “meet ARARs.” In addition, later parts of the ROD (see Sections 2.12.2.4 and 2.13.2.3) suggest that the federal and state NRC rules are “the” ARARs that the radiological discharge component of the remedial action must meet. This is inconsistent with the December 31, 2020, Administrator Wheeler Decision and the January 19, 2021 supplemental ARARs, which identified additional Clean Water Act (CWA) regulations as ARARs for the discharge of wastewater and also directed that the existing CWA ARARs already identified as “applicable” to pollutant be designated as “relevant and appropriate” to radionuclides. Also inconsistent with the Decision’s direction, DOE did not identify certain state water quality standards as “relevant and appropriate” to radionuclides (e.g., TDEC 0400-40-04-.03(4)). This must be corrected in the ROD. EPA is aware that AWCQ-equivalents for radionuclides are being developed and the D3 FFS is being revised. Information from the approved FFS should be included in the final EMDF ROD.</p> | <p>See response to General Comments 1 and 9.</p> <p>Clarification provided. In addition, ARARs were revised in consultation with the FFA parties as described in responses to comments on specific ARARs.</p> |

|----------|-------------|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E        | 54          | Sect. 2.8<br>p. 2-17                           | <p>REMEDIAL ACTION OBJECTIVES</p> <p>Remediation Goal (2.8) – Under CERCLA we need to set remediation goals for all parts of the response. Will there be an unacceptable risk to a person standing on the landfill due to gamma radiation? What level of radioactivity will be allowed to be disposed in this unit? A Low-Level Waste designation does not provide information as to the level of radiation. Please address these issues in the revised ROD.</p>                                                                                                                                                                                                                                                                                                                                        | <p>Agree. The following text was added to the section:</p> <p>“Based on the projected radiological inventory (Sect. 2.12.2.3) for EMDF and the engineered features of the facility (including the 11-ft final cover over the waste), detailed performance analyses (United Cleanup Oak Ridge LLC [UCOR] 2020) indicate no unacceptable risk from radiological waste contaminants (direct or inhalation exposure) is expected. The pathways of concern are limited to those presented by way of water resources or through contact with waste, assuming some inadvertent intrusion into the waste. Therefore, the following RAOs were used in the development of this waste disposal remedy:”</p> |
| E        | 55          | Sect. 2.8<br>p. 2-17<br>1 <sup>st</sup> bullet | <p>REMEDIAL ACTION OBJECTIVES</p> <p>“Prevent exposure of people to waste in EMDF (or contaminants released from the EMDF into the environment) through meeting chemical-, location-, and action-specific ARARs, and by preventing exposure that exceeds a human health risk of 10-4 to 10-6 ELCR or HI of 1.” Please explain “prevent exposure”; does this involve direct contact, inhalation, fish consumption, etc.? Also, please modify this RAO as follows:</p> <p>Prevent exposure of people to CERCLA waste ( or contaminants released from the waste into the environment including soil, air, surface water and groundwater) through meeting chemical-, location-, and action-specific ARARs, and by preventing exposure that exceeds a human health risk of 10-4 to 10-6 ELCR or HI of 1.</p> | <p>Disagree. The RAO was agreed on by the FFA parties in the Proposed Plan. No change is necessary. The suggested change does not substantively change the RAO.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Category | Comment No. | Sect/<br>Page                                  | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Response                                                                                                                                                                                                             |

| E        | 56          | Sect. 2.8<br>p. 2-17<br>2 <sup>nd</sup> bullet | <p>REMEDIAL ACTION OBJECTIVES</p> <p>Please correct the acronym in the following text:</p> <p>Prevent adverse impacts to water resources (surface water and groundwater) from CERCLA waste or contaminants released from the waste through meeting chemical-, location-, and action-specific ARARs, and by preventing exposure that exceeds a human health risk of 10-4 to 10-6 <b><u>ECLR</u></b> or HI of 1. (Bold and underline added)</p> <p>The acronym should be ELCR - excess lifetime cancer risk.</p> <p>Also, please modify this RAO as follows:</p> <p>Prevent adverse impacts to water resources (surface water and groundwater) from CERCLA waste or contaminants released from the waste through meeting chemical-, location-, and action-specific ARARs, and by preventing <del>exposure releases to groundwater or surface water that</del> exceed a human health risk of 10-4 to 10-6 ECLR or HI of 1 <u>for recreation use of surface water and use of groundwater for drinking water.</u></p> | <p>Agree. The acronym was corrected to ELCR.</p> <p>Disagree. The RAO was agreed on by the FFA parties in the Proposed Plan. No change is necessary. The suggested change does not substantively change the RAO.</p> |
| E        | 57          | Sect. 2.9<br>p. 2-17                           | <p>The first paragraph states that the alternatives are presented in the ROD as they were presented in the RI/FS and that any later changes are discussed in a separate part of the ROD. While it is not clear from this text, if the alternatives are not as they were presented in the Proposed Plan, please correct this section to reflect the alternatives as presented in the Proposed Plan.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Agree. Text was modified to indicate no changes since the Proposed Plan rather than the RI/FS.</p>                                                                                                                |
| E        | 58          | Sect. 2.9.2<br>p. 2-18                         | <p>Alternative 2 – Onsite Disposal Alternative</p> <p>The description of the four sites evaluated for potential location of EMDF use different terminology than figure 2.2 (p. 2-5). Help the reader match the four locations described in the text to the figure. For example (shown in bold and underlined text):</p> <ul style="list-style-type: none"> <li>• East Bear Creek Valley (EBCV) site, just east of the existing EMWMF <b><u>(labeled Site 5 on figure 2.2)</u></b></li> <li>• West Bear Creek Valley (WBCV) site, located approximately 2.5 miles west of the existing EMWMF <b><u>(Site 14)</u></b></li> <li>• Dual site, which includes a site beside and to the west of the existing EMWMF, and a second site in CBCV, located 1.5 miles west of the existing EMWMF <b><u>(Sites 6b and 7a)</u></b></li> <li>• CBCV, expansion of one of the dual sites <b><u>(Site 7c)</u></b>.</li> </ul>                                                                                                    | <p>Agree. Text has been revised as suggested to provide clarification between the text and the figure.</p>                                                                                                           |

| Category | Comment No. | Sect/<br>Page                     | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Response                                                                                                                                                                                                                                                                         |
|----------|-------------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A        | 59          | Sect. 2.9.2<br>p. 2-18            | <p>Decision Summary</p> <p>The fourth full paragraph, last sentence, states that an ARAR-compliant wastewater treatment system was part of the onsite disposal alternative. That statement is not supported by the record in this case (i.e., no approved FFS for wastewater management, but the D3 FFS provided by DOE does not currently appear to comply with the most stringent ARARs for discharge of landfill wastewater and does not clearly acknowledge Clean Water Act requirements – both federal and state – as RAR for the discharge of radionuclides). EPA expects the revised FFS to include state and federal CWA requirements, and ARARs from the revised and approved FFS to be incorporated into the revised EMDF ROD.</p>                                                                                     | <p>Comment noted. The FFS and the EMDF ROD contain state and federal CWA requirements. ARARs in the ROD have been agreed on by the FFA parties.</p>                                                                                                                              |
| E        | 60          | Sect. 2.10.1<br>p. 2-20           | <p>Decision Summary</p> <p>The second paragraph, first sentence, states, “The No Action Alternative is the least protective as it is anticipated that the lack of a coordinated disposal program results in an increased reliance on management of waste in place at CERCLA remediation sites and a potential slowing of the pace of cleanup.” Use of off-site disposal options (although likely more costly) would not necessarily result in containment remedies for the other CERCLA response actions under the FFA. It is premature to make this declaration in the ROD. Accordingly, the language in the ROD should be consistent with the Appendix G of the RI/FS or clarified considering this remedy selection process for an on-site landfill is not directly addressing existing releases of hazardous substances.</p> | <p>Disagree. An onsite disposal facility supports the current accelerated cleanup schedule for the Oak Ridge Reservation. Relying solely on offsite shipping will slow the pace of cleanup, requiring more reliance on in-place management of waste until cleanup can occur.</p> |
| E        | 61          | Sect. 2.10<br>p.2-21<br>Table 2.1 | <p>Overall Protection of Human Health and the Environment</p> <p>“Offsite Alternative: More protective than the Onsite or Hybrid Disposal Alternatives in preventing releases on the ORR because waste would be permanently removed and disposed in unpopulated regions with greater depths to groundwater.” It is either protective or not, so please delete the term “more protective. “Please explain the long-term effectiveness and permanence versus short term risks of the offsite alternative.</p>                                                                                                                                                                                                                                                                                                                      | <p>Clarification provided. The term “more” was deleted, and comparison to other alternatives was deleted. The bullet regarding short-term risk was deleted since it is addressed under short-term effectiveness.</p>                                                             |
| E        | 62          | Table 2.1<br>p. 2-22              | <p>Summary of CERCLA evaluation criteria for disposal alternatives (cont.)</p> <p>Short-term effectiveness: The table includes the collection of leachate in a leachate collection system, but does discuss treatment of leachate, and does not discuss collection and treatment of contaminated stormwater (also known as “contact water”). Please add a brief description of how that wastewater will be managed.</p>                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Agree, the bullet was revised as follows:</p> <ul style="list-style-type: none"> <li>• “Onsite facility requires management of landfill wastewater through collection in the leachate collection system and in-cell catchments.”</li> </ul>                                   |

|----------|-------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| T        | 63          | Sect. 2.10.2<br>p. 2-24 | <p>Decision Summary</p> <p>The third paragraph states that all onsite alternatives meet ARARs. As noted in other paragraphs, there is an insufficient record to support this statement. Notably, this paragraph does not discuss the wastewater discharge ARARs. While it would be more complete to include in this section a discussion of those ARARs, it would be inappropriate to assert, at this time, that those ARARs will be met since the ROD has no AWQC equivalents for radionuclides or effluent limits that will be protective of those instream AWQCs and meet TDEC Water Quality Standards regulations. EPA is aware that AWCQ-equivalents for radionuclides are being developed and the FFS is being revised, and must be approved prior to finalization of the ROD. EPA expects this information to be in the revised ROD.</p> | <p>Agree. The specific remediation goals for landfill wastewater are specified in the D2 ROD (Sect. 2.12.2.4). The approach was agreed upon among the FFA parties. The discharge limits will be developed in the future, based on the remediation goals, when the specifics of the EMDF landfill wastewater treatment systems are known, including the discharge location. The remediation goals and future discharge limits are within the CERCLA risk range and protective of Human Health and the Environment.</p> |
| E        | 64          | Sect. 2.10.3<br>p. 2-25 | <p>Long-term Effectiveness and Permanence</p> <p>“The No Action Alternative may or may not have been effective, as it would depend on multiple future individual waste disposal decisions. Because the decisions would be under CERCLA, they would be required to be protective.” Effective and protective are different criteria. Each criteria (protectiveness, effectiveness, and permanence) should be discussed individually and clarified in the revised ROD.</p>                                                                                                                                                                                                                                                                                                                                                                         | <p>Agree. The text was revised as follows:</p> <p>“The effectiveness and permanence of the No Action Alternative depends on decisions made by multiple future individual CERCLA waste disposal projects. Because the decisions would be under CERCLA, they would be required to demonstrate long-term effectiveness and permanence of the proposed controls to be protective.”</p>                                                                                                                                    |
| E        | 65          | Sect. 2.10.3<br>p. 2-25 | <p>Decision Summary</p> <p>The third paragraph, last sentence, states that landfill wastewater generation would cease upon landfill closure. Please confirm the accuracy of this statement and revise the text accordingly. Typically, leachate can be generated after final closure as the waste continues to dewater.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Agree. Text was modified to:</p> <p>“Upon closure, when the landfill cover would be placed, landfill wastewater generation would gradually cease as the landfill waste is dewatered over an extended period of time.”</p>                                                                                                                                                                                                                                                                                          |
| E        | 66          | Sect. 2.10.4<br>p. 2-26 | <p>Decision Summary</p> <p>The third paragraph, first sentence states that “Onsite Disposal Alternatives would provide landfill wastewater treatment needed to meet ARARs, including portions of the Clean Water Act of 1972 (CWA) that address hazardous chemicals and ARARs addressing radiological discharges.” This appears to be incorrect or at least confusing, as it suggests that the CWA requirements are different from the ARARs addressing “radiological discharges.” Please revise this sentence to read, “Onsite Disposal Alternatives would provide landfill wastewater treatment needed to meet ARARs, including portions of the Clean Water Act of 1972 (CWA) regulations that address hazardous chemicals and radiological discharges as well as Nuclear Regulatory Commission requirements that addresses radiological</p>  | <p>Agree. Text modified as suggested.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|          |             |                                                      | discharges alone.”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| E        | 67          | Sect. 2.10.4<br>p. 2-26<br>4 <sup>th</sup> paragraph | <p>Reduction of Toxicity, Mobility, or Volume Through Treatment</p> <p>Although the text states that treatment is not part of the remedy, the statement is misleading. Please revise the text to clarify that aspects of treatment could include waste volume reduction. Additionally, a general description of administrative and physical WAC should be presented. Consider explaining the waste disposal hierarchy to conserve EMDF capacity (similar to the hierarchy decision tree used for the EMWMF). This will present to the community the commitment to ensure disposal of waste material will be implemented responsibly.</p>                                         | Agree. Text was added to address additional information in comment.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| E        | 68          | Sect 2.10.5<br>p. 2-27                               | <p>Short-term Effectiveness</p> <p>There is a discussion regarding short-term environmental effects of onsite disposal, such as land disturbance and loss of habitat, however, it does not address impacts of increased stormwater or discharges of landfill wastewater to Bear Creek or tributaries to Bear Creek. Please add that information to this discussion.</p>                                                                                                                                                                                                                                                                                                          | Clarification. Stormwater flow rate is not expected to increase due to the presence of the landfill, it will require management and redirection, but will not result in overall increase in flow rate entering Bear Creek or its tributaries. Short-term effectiveness is held to a discussion of construction of the landfill. A discussion of the discharge of landfill wastewater is given in the long-term effectiveness, see Sect.2.10.3, fourth paragraph, where this is discussed.                     |
| E        | 69          | Sect. 2.10.5<br>p. 2-27                              | <p>Short-term Effectiveness</p> <p>The proposed EMDF will impact forested lands. The text states:</p> <p>“Disturbance to terrestrial resources would be expected, with land use resulting in losses/changes of habitat and displacement of wildlife from the construction areas. The greatest impact would be installation of EMDF in CBCV or WBCV, where up to 94 acres of forested land would be expected to be impacted. The other onsite alternatives had less, but still notable, impact on environmental habitat.”</p> <p>Some of the public comments ask why DOE is building the EMDF in a greenspace. Please address in this section and the responsiveness summary.</p> | <p>Clarification provided. The siting discussion is found in Sect. 2.5. Please note that this site is located on the ORR near the Bear Creek Burial Grounds and adjacent to the Haul Road and ORR maintenance facilities.</p> <p>The following statement was added in Sect. 2.10.5 and in appropriate locations in the Responsiveness Summary:</p> <p>“DOE considered all brown field sites first, but ultimately the CBCV site provided the most beneficial attributes in total over those other sites.”</p> |
| C        | 70          | Sect. 2.10.7<br>p. 2-28                              | <p>Cost</p> <p>Costs are in FY 2016 dollars (page 2-28) and in FY 2012 dollars (page 2-49). Costs should be consistent and should be updated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Agree. Costs are updated to FY2021 dollars.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| P        | 76          | Sect. 2.10.9<br>p. 2-29 to 2-30                      | <p>Decision Summary</p> <p>DOE's statement that it "obtained public input on the proposed action for onsite disposal of Oak Ridge NPL Site CERCLA waste at EMDF" should be qualified since information collected after the proposed plan was not made available to the public for consideration. The original Proposed Plan for on-site CERCLA waste disposal was issued to the public (September 10, 2018) and comments were sought through early 2019. New information has been obtained (i.e., DOE obtained groundwater elevation data which it documented in <i>Technical Memorandum 2</i>, which indicated groundwater elevations higher than projected in the RI/FS) and is being developed (i.e., water quality values for radionuclides) since the original Proposed Plan was published. Under the NCP, new information should be made available for public review and comment consistent with 40 CFR § 300.430(f)(3) before it can issue a ROD with a selected remedy which includes discharges of wastewater from the EMDF landfill along with effluent limits identified as cleanup levels. Thus, the ROD will need to be revised, at a minimum, to include additional responses to any received public comments in the Responsiveness Summary and the remedy may need to be revised in response to public comments as part of the NCP's Modifying Criteria for community acceptance. EPA is aware that AWCQ-equivalents for radionuclides are being developed and the D3 FFS is being revised. Please revise the ROD to reflect this information.</p> | <p>Clarification provided. With submittal of the D1 ROD, the FFA parties recommended additional public engagement. That effort allowed for additional public comment, and responses to these additional comments are addressed within the D2 ROD.</p> |

This section does not include discussion of habitat loss, especially with regards to threatened or endangered species, and does not discuss the potential impact to water quality or habitat associated with Site 7c in Bear Creek Valley.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Clarification provided. The CERCLA decision making process incorporates the NEPA values as part of the follow-on primary documents detailing the action to be taken. These documents are provided for EPA and TDEC review and approval.</p>        |
| E        | 79          | Sect. 2.10.10<br>p. 2-32                             | <p>NEPA Values, Environmental Justice</p> <p>There is one paragraph in the D1 ROD addressing Environmental Justice (located in the "NEPA Values" section). As written, the D1 ROD insufficiently addresses environmental justice. Environmental Justice is about the disproportionate environmental burdens on a community from cumulative environmental impacts, not limited to the particular decision at hand (EMDF). An evaluation is needed to identify communities with potential environmental justice concerns. If</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Agree. The text has been revised (Sect. 2.10.11) to add a discussion on Environmental Justice.</p>                                                                                                                                                 |

|          |             |                          | <p>communities with environmental justice concerns are present, further evaluation of the concerns and appropriate responses may be needed. EPA has provided some resources on this matter, and is available for further consultation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                               |
| E        | 80          | Sect. 2.10.10<br>p. 2-32 | <p>NEPA Values, Environmental Justice</p> <p>A new section should be added that conveys the results of an EJ analysis. The 2015 EPA “Guidance on Considering Environmental Justice During the Development of Regulatory Actions” provides more information on how to consider EJ. The guidance states “current EPA guidance does not prescribe or recommend a specific approach or methodology for conducting screening-level analysis. A screening-level analysis should provide information related to whether there may be potential EJ concerns associated with regulatory actions, and may include elements such as the following:</p> <ol style="list-style-type: none"> <li>1. A description of the potential impacts on, and existing risks to, minority populations, low-income populations, and/or indigenous peoples. This may involve a description of:           <ul style="list-style-type: none"> <li>• The proximity of sources being regulated to these populations</li> <li>• The number of sources that may be impacting these populations</li> <li>• The nature and amount of pollutants that may be impacting these populations</li> <li>• Whether there are any unique exposure pathways involved</li> <li>• Combinations of the various EJ factors occurring in conjunction with one another</li> <li>• Expressed stakeholder concerns about the action, if any.</li> </ul> </li> <li>2. A description of potential impediments to meaningful involvement. This may involve understanding whether the action presents opportunities to improve public involvement requirements or limits opportunities in some way.” After initial screening, qualitative factors addressing site-specific factors should be identified and considered.</li> </ol> <p>Revise this section of the ROD and address the guidance on EJ and these specific issues.</p> | <p>Agree. The text has been revised (Sect 2.10.11) to add a discussion on Environmental Justice. This new section conveys the results of the environmental justice analysis as described in this comment.</p> |

| E        | 81          | Sect. 2.10.10<br>p. 2-32<br>2 <sup>nd</sup> paragraph | NEPA Values<br><br>Please reference Executive Order 12898-Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations and add more information regarding the DOE's environmental justice assessment regarding air deposition from EMDF landfill operations and the impact to nearby communities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Agree. Reference was added and air deposition is addressed in the new Sect. 2.10.11.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| D        | 82          | Sect. 2.11<br>p. 2-32                                 | Decision Summary<br><br>This section discusses principal threat waste and concludes that there is no principal threat waste concern in this ROD. To the degree that the discharge of landfill radiological wastewater is as DOE represented in the D3 FFS, which is at or greater than a 10-3 level of risk when using Clean Water Act recreational use exposures, this would likely constitute the discharge of principal threat waste into Bear Creek, in that this effluent at these concentrations (e.g., for Tc-99 a concentration of 1,818,240 pCi/L at the end of pipe) meets all three elements of PTW: it is liquid, mobile and highly toxic. As noted above, however, once DOE has revised the Wastewater FFS and ROD to include AWQC equivalent and effluent limits that meet all the ARARs (including the most stringent CWA and TDEC water quality standard regulations), this should be an accurate statement. | See responses to General Comments 1 and 9. No revision necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| E        | 83          | Sect. 2.12<br>p. 2-33                                 | SUMMARY OF PREFERRED REMEDY<br><br>The following text should be added to this section:<br><br>Because land use restrictions are part of the remedy, a land use control (LUC) plan should be part of a remedial design or remedial action work plan for EPA and TDEC review and approval, and should contain implementation and maintenance actions, including periodic inspections.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Agree. Text was added to note that the LUCIP contained in the BCV RAR CMP will be updated, as will the CERCLA waste disposal LUCIP (originally written for EMWMF and attached to the EMWMF RDR).                                                                                                                                                                                                                                                                                                                                                                                         |
| L        | 84          | Sect. 2.12<br>p. 2-33<br>3 <sup>rd</sup> paragraph    | SUMMARY OF THE PREFERRED REMEDY<br><br>Specify that a land use change to restricted recreational use is selected for Zone 1 for short and long term, and state the rationale for that change. Land use is not being changed from unrestricted to restricted recreational because there are no trespassing signs; rather, the land use change is being made to provide a buffer between the landfill and potential human access (or other reason that should be stated). The text states that fish consumption advisories and prohibitions on fishing are in place, but please include the reasons for the advisories and prohibitions, and whether these advisories and access (no trespassing) prohibitions will be needed in                                                                                                                                                                                               | Agree. Text modified as requested.<br><br>A restricted recreational use is selected for setting cleanup goals in Zone 1 because it serves as a buffer area to Zone 2, the location of the EMDF, and since occasionally turkey and deer hunting is allowed in some surrounding DOE areas and portions of BCV. Typically, however, the public is restricted from entering the BCV area at Highway 95 and to the east, as it serves as a buffer area to Y-12 ( <i>No Trespassing</i> is posted at Bear Creek Road and the road is patrolled on a regular, daily basis). Limited hunt access |

|          |             |                         | the long term.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | location maps/dates may be obtained from the local hunting authorities and are adjusted as necessary to reflect current conditions across the ORR. Fishing in Bear Creek, not included in open hunt accesses, is deterred as part of DOE's <i>No Trespassing</i> postings. Further, current State of Tennessee fish advisories exist for Bear Creek, due to elevated mercury and PCB concentrations in fish, and will continue to be posted as long as fish continue to present a consumptive health hazard per TDEC decisions. |
| T        | 85          | Sect. 2.12.1<br>p. 2-35 | <p>Decision Summary</p> <p>The second paragraph states that the remedy described in the ROD is protective and attains ARARs. As noted in earlier comments, because the ROD fails to establish AWQCs for radionuclides and corresponding discharge limits that are protective of those AWQCs, there is no basis for concluding that the remedy is protective or attains ARARs. The only indication of the kind of discharge limits that DOE is proposing is in the D3 FFS, which EPA has not approved because it fails to establish discharge limit PRGs that are protective and meet ARARs. EPA expects this issue to be resolved in a revised and approved D3 FFS and in the final ROD.</p> | See response to Specific Comment 63.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| E        | 86          | Sect. 2.12.2<br>p. 2-35 | <p>Decision Summary</p> <p>The second paragraph incorrectly dismisses the CERCLA statutory preference for treatment as "not germane to a disposal decision." Please note that this preference is not excluded for any remedial action. Please include an analysis of whether the remedy meets that statutory preference, paying attention to the waste, including the wastewater generation component of this remedy.</p>                                                                                                                                                                                                                                                                    | Agree. Text was modified to address the comment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| E        | 87          | Sect. 2.12.1<br>p. 2-35 | <p>Summary of the Rationale for the Selected Remedy</p> <p>The text states:</p> <ul style="list-style-type: none"> <li>The site is <b>adjacent</b> to an existing area designated as a CERCLA waste management area (i.e., EMWMF) <i>along with several other CERCLA disposal areas in BCV.</i></li> </ul> <p>This sentence is not clear and should be revised. The Site 7c EMDF location will be approximately 1.5 miles (2.4 kilometers) west of the existing EMWMF. While land use designation Zone 2 (the area containing the EMDF) is adjacent to Zone 3 (the area containing the EMWMF) the location of the EMDF is not “adjacent” to the existing EMWMF. Additionally, the italicized text is not accurate and should be changed to reflect TDEC-permitted Resource Conservation and Recovery Act managed landfills and not multiple CERCLA-managed landfills. The is only one CERCLA-managed landfill, the EMWMF.</p> | <p>Agree. The bullet was modified to more accurately indicate the advantages of the location.</p> <p>“The site is located along the Haul Road, allowing incoming waste from Y-12 and ORNL to remain fully on DOE property and out of commerce, and the existing CERCLA waste management area (i.e., EMWMF) is nearby (approximately 1.5 miles to the east, following the Haul Road).”</p>                                                                                                                                                                                                                       |
| E        | 88          | Fig. 2.5<br>p. 2-36     | <p>EMDF conceptual site layout</p> <p>Please label D-11 East. Stream D-11 East is discussed in the text, but not shown on the figure. Will there be a settling basin for uncontaminated stormwater (non-contact water)? Please identify this feature (if present) in this figure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Disagree. This figure shows post construction conditions when D-11 East is no longer present.</p> <p>Clarification provided. Settling basins will be provided in the final design for uncontaminated stormwater. A note has been added to the figure, and the location and configuration of these stormwater ponds will be provided in the RDR, which will be provided for EPA and TDEC review and approval.</p>                                                                                                                                                                                             |
| W        | 89          | Sect. 2.12.2<br>p. 2-37 | <p>Description of the Selected Remedy</p> <p>Waste Acceptance Criteria (WAC) – The draft does not include numerical waste acceptance criteria and therefore this package is deficient. Furthermore, the public has not been given the opportunity to review the Waste Acceptance Criteria. DOE should address this in the planned public form and include information on the WAC in the final ROD.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Clarification provided. Numerical WAC were provided in the D1 (Tables 2.5 and 2.6). These tables have been combined and expanded in the D2 ROD (Table 2.7) to indicate that Landfill Inventory Limits for more radionuclides may be included in the WAC Compliance Plan. DOE has agreed to conduct a supplemental analysis based on alternate assumptions regarding future landfill performance and exposure pathways. This supplemental analysis and results will inform development of the WAC Compliance Plan and landfill design. The WAC will be addressed during the additional public engagement.</p> |

| D        | 90          | Sect. 2.12.2<br>p. 2-37                | Description of the Selected Remedy<br><br>Construction and operation of a landfill wastewater treatment system (LWTS) consistent with ARARs. Details of the LWTS should be included as part of the remedial design which will undergo EPA review/approval. This should be explained in the selected remedy section along with a schedule for remedy implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Clarification provided. As described in Sect. 2.12.2, the EMDF design includes a landfill wastewater treatment facility. The design will be provided for FFA party review and approval in a follow-on RDR, which is a primary document. Operation of the LWTS will be contained in the follow-on RAWP.                                                                                                                                                                                                      |
| L        | 91          | Sect. 2.12.2<br>p. 2-38<br>last bullet | Description of the Selected Remedy<br><br>The text states that the remedy includes “Change of the initial land use designation used to set remediation goals in BCV Zone 2 to future DOE-controlled industrial land use of the area.” Additional text should be added to indicate that the land use designation for BCV Zone 1 is also being changed, in this case, from unrestricted to restricted recreational.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Agree. Text has been revised as suggested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| E        | 92          | Sect. 2.12.2.2<br>p. 2-38              | Construction activities<br><br>“The EMDF construction will be conducted in phases over the cleanup time frame.” Please include the anticipated time frame for cell construction and anticipated schedule for those activities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Clarification provided. It is premature to state timelines for each phase; however text was added later in the section to clarify expectations. (See response to Comment 95).<br><br>“As indicated, the landfill capacity will be constructed in three phases, with the first construction phase to occur following closely after completion and FFA approval of the final design. Construction of future Phases 2 and 3 will be determined based on capacity needs as the ORR cleanup program progresses.” |
| S        | 93          | Sect. 2.12.2.1<br>p. 2-38              | (Conceptual design of EMDF and infrastructure)<br><br>“The landfill will not be constructed over NT-10 or NT-11, but the berm may be placed over D-10W,” yet Figure 2.5 (EMDF conceptual site layout) indicates that the support facilities [i.e., landfill wastewater treatment system (LWTS), storage area, leachate/contact water storage] and Site 7b Borrow Area will be constructed over an unnamed creek. The ROD includes no discussion regarding the short- and long-term impact on this creek or how Applicable and Relevant and Appropriate Requirements (ARARs) will be met. It should be noted that diversion ditches are discussed in the ROD for rerouting D-10W but not for this creek. Revise the ROD to discuss the short- and long-term impact of constructing support facilities and Site 7b Borrow Area over this unnamed creek and how it will comply with ARARs. | Clarification provided. The drainage in the borrow area and support area is typically dry except during periods of precipitation. This drainage feature will be further evaluated and appropriate controls such as culverts will be included as part of the final design package that will be included in the Remedial Design Report. Any additional mitigation necessary to comply with ARARs will be described in the RDR.                                                                                |

| E        | 94          | Sect. 2.12.2.2<br>p. 2-38 and 2-39 | <p>Construction activities</p> <p>Section 2.12.2.2 states, “Borrow material for EMDF will be obtained from the knoll just east of the facility and other locations at ORR, which will be developed during this early phase;” however, it is unclear why borrowing materials from an adjacent knoll is proposed when borrow material will be available from the EMDF site. As noted in the Phase 1 Construction subsection of Section 2.12.2.2, “The site will be graded to the top of the geologic buffer and the perimeter berm will be constructed to support the first cell(s).” If the materials excavated from the EMDF site are suitable, they should be reused. Revise Section 2.12.2.2 to clarify why borrowing materials from an adjacent knoll is proposed when borrow material will be available from the EMDF site.</p> | <p>Agree. Text was added to note that site excavated material will be used wherever possible, but if there is not sufficient volume for the construction needs, borrow material will be used.</p>                                                                                                                                                                                                                                                                                              |
| E        | 95          | Sect. 2.12.2.2<br>p. 2-39          | <p>Construction activities</p> <p>“As the overall design of the landfill progresses, the scope of activities in the site preparation phase may be modified.” Add timelines for each phase of construction.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Clarification provided. It is premature to state timelines for each phase; however text was added following the quoted sentence, to clarify expectations.</p> <p>“As indicated, the landfill capacity will be constructed in three phases, with the first construction phase to occur following closely after completion and FFA approval of the final design. Construction of future Phases 2 and 3 will be determined based on capacity needs as the ORR cleanup program progresses.”</p> |
| W        | 96          | Sect. 2.12.2.3<br>p. 2-39          | <p>Waste acceptance criteria</p> <p>The text states:</p> <p>These criteria are derived from various constraints placed upon EMDF, such as specific risk <b>or dose limits</b> and design elements in regulatory-based laws and guidance, as well as constraints on waste acceptance that are established through discussion and agreement among the FFA parties (DOE, EPA, and TDEC). (Bold and underlining added)</p> <p>Remove the words “or dose limits” since CERCLA is based on risk. The DOE-based dose limits will not be considered or used to make decisions in this CERCLA ROD.</p>                                                                                                                                                                                                                                       | <p>Agree. Text has been revised as follows:</p> <p>These criteria are derived from various constraints placed upon EMDF, such as specific risk limits or ARARs and design elements in regulatory-based laws and guidance, as well as constraints on waste acceptance that are established through discussion among the FFA parties and are documented in this ROD.</p>                                                                                                                         |

| WM       | 97          | Table 2.4<br>p. 2-41      | EMDF administrative WAC<br><br>It is EPA's understanding that mercury waste that is also RCRA hazardous waste by characteristic (i.e., toxicity) will be prohibited; please add to the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Agree. Mercury waste that is characteristically RCRA hazardous waste is prohibited from disposal per negotiations, as documented in the administrative WAC table in Sect. 2.12.2.3. [Note this is now Table 2.6.]                                                                                                       |
| W        | 98          | Sect. 2.12.2.3<br>p. 2-40 | Waste acceptance criteria<br><br>The text states:<br><br>These two elements of the WAC ( <b>along with additional procedures for implementing those WAC</b> ) must be met before waste may be placed in the EMDF for disposal. (Bold added)<br><br>What are the "additional procedures" highlighted in bold text? Please add text to clarify and explain what this entails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Agree. Text was added as follows: "These two elements of the WAC (along with additional procedures for implementing those WAC that will be detailed in the WAC Compliance Plan) must be met before waste..."<br><br>Also, please note that further explanation is given throughout the rest of this section in the ROD. |
| W        | 99          | p. 2-42                   | Analytical WAC<br><br>The text states:<br><br>The inventory (WAC) limits are the maximum values allowed per the ARAR dose for protection of the public, which has been deemed protective under CERCLA by EPA. <sup>5</sup><br><br>Footnote 5 states:<br><br><sup>5</sup> <b>EPA Administrator, Dispute Resolution Decision on radiological discharge limits for the Oak Ridge Reservation, December 31, 2020.</b> (Bold added)<br><br>Footnote 5 citing the 12/31/20, EPA Administrator decision addresses radiological wastewater discharge and not the WAC. It is unclear if this statement is citing the old ARAR of NRC 10 CFR61, the 25/75/25 NRC dose and state rules 10 CFR 61.41/TDEC 0400-20-11-.16(2), or something different. Note that EPA considers only regulatory effective dose limits of 12 mrem or less as sufficiently protective ARARs and nothing higher. Rewrite this sentence and modify the footnote to clarify the issue being discussed consistent with CERCLA risk. | Clarification. The footnote cites three instances (the 12/31/20 decision, the Remedy Review Board letter, and the EPA OSWER directive) that all indicate the ARAR is within the CERCLA risk range. The footnote has been reordered to cite the EPA OSWER directive first.                                               |
| E        | 100         | Sect. 2.12.2.3<br>p. 2-43 | Waste acceptance criteria, citation to Table 2.6<br><br>Typo: "Table 2.6 also met the CERLCA threshold..." please change to CERCLA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Clarification provided. | W        | 102         | Sect. 2.12.2.3<br>p. 2-45 | Waste acceptance criteria<br><br>A. Although there is no chemical specific Tennessee WQS for radionuclides, the discharge must not violate TDEC narrative WQS. This means that radioactivity or other releases to the environment from the EMDF cannot cause damage to the diversity or productivity of benthic macroinvertebrate communities or fish communities. Radionuclides have long-half lives, and bioaccumulate in the environment. Monitoring for remedy effectiveness should include benthic macroinvertebrate and fish community surveys and the measurement of mercury, PCBs, uranium, and radionuclides in forage fish and benthic macroinvertebrates to assess exposure. To the degree that baseline data are unavailable, data will be necessary to characterize the health of aquatic communities and their contaminant body burdens prior to the landfill construction to provide a point of comparison.<br><br>B. Text on Page 2-45 does not discuss control of mercury methylation although methylmercury is more mobile in the environment and is 90% of the total mercury in fish tissue. A study by Mathews et al. (2013) indicated that surface water concentration would likely need to be less than 51 ppt to achieve the tissue-residue based NRWQC for mercury in fish tissue of 0.5 ppm. Revise the text to discuss the effects of the proposed remedy on mercury methylation and how the proposed remedy will meet ARARs. | Clarification provided. The section in the ROD has been updated consistent with the FFA parties’ agreed upon mercury management approach.                                      |
| WM       | 103         | Sect. 2.12.2.3<br>p. 2-45 | Mercury Management Approach<br><br>In the second bullet, there are inaccuracies in both sub-bullets. In the first sub-bullet, please note that the limits must be established consistent with TDEC’s “Antidegradation Statement” at TDEC 0400-40-03-.06 as well a technology-based effluent limit (if it is more stringent than the recreational water quality criterion-based limit 0.51 ng/L). If DOE pursues remediation of Bear Creek addressing sources of methylation such that the non-attainment status of mercury in fish tissue is corrected and reduced below the 0.3 mg/kg level, then the antidegradation-based limits would not be based on an “unavailable parameter,” and the discharge limits could be revised depending on the assimilative capacity via a post-ROD                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Clarification provided. The section in the ROD has been updated consistent with the FFA parties’ agreed upon mercury management approach.                                      |

|          |             |                           | modification. The language in this section should be revised to be consistent with any Mercury Management approach agreed upon by all the FFA parties. EPA is aware that the mercury management approach is under development and expects it to be revised in the next version of the ROD.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| WM       | 104         | Sect. 2.12.2.3<br>p. 2-45 | <p>Decision Summary</p> <p>This section states that mercury wastewater will be discharged at 0.51 ppt (WQBEL). Please note that there are three ARARs that apply to the discharge of mercury (as well as PCBs) since Bear Creek is designated by TDEC as non-attainment for these pollutants. In order to meet the CWA requirements and be consistent with the NCP, the discharge must meet the most stringent of either the TBEL (which has yet to be determined), a WQBEL, or an antidegradation-based limit. Please revise the text accordingly to reflect that establishment of effluent limit for mercury will meet the most stringent of a technology-based, water quality-based, or antidegradation-based effluent limit consistent with the Mercury management approach being discussed between the FFA parties. Please note, the FFA parties are developing a proposed Mercury Management Approach for Discharges to Bear Creek. This document includes a process for establishing and modifying effluent limits for mercury that hinges on whether non-attainment can be removed as result of addressing sources of methylation, if approved by the FFA parties, that information would be contained in this section of the ROD.</p> | Clarification provided. The section in the ROD has been updated consistent with the FFA parties' agreed upon mercury management approach.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| E        | 105         | Sect. 2.12.2.4<br>p. 2-45 | <p>The term "wastewater" should be defined in the ROD as "leachate and contaminated stormwater (also known as contact water)." For example: <b>Landfill wastewater from EMDF, defined as landfill leachate and contaminated stormwater (also referred to as contact water), will be stored and sampled.</b> This section may be the appropriate place for this clarification.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Clarification provided. Based on other comments, Sect. 2.9.2 has been revised to include the following definition for "landfill wastewater":</p> <p>Landfill wastewater is defined in 40 <i>CFR</i> 445.2(f) as all wastewater associated with, or produced by, landfilling activities except for sanitary wastewater, non-contaminated stormwater, contaminated groundwater, and wastewater from recovery pumping wells. Landfill wastewater includes, but is not limited to, leachate, gas collection condensate, drained free liquids, laboratory derived wastewater, contaminated stormwater, and contact wash water from washing trucks, equipment, and railcar exteriors and surface areas that have come in direct contact with solid waste at the landfill facility.</p> |

| D        | 106         | Sect. 2.12.3.4<br>p. 2-46 | <p>Decision Summary</p> <p>In the second paragraph, the lack of water quality values for radionuclides in the ROD illustrates a problem for not only this statement, but with the ROD itself. While DOE states that it will create water quality-based discharge limits, not having them for EPA to review in the D1 ROD delays EPA’s ability to evaluate whether the ROD is protective and complies with ARARs. Currently, without the water quality values for radiological discharge and a scientifically-valid basis for those standards, it is neither.</p> <p>In addition, the discharge criteria would, at least for non-radiological pollutants, include technology-based effluent limits; references in the ROD are to only AWQCs as discharge criteria (see Section 2.12.2.3, <b>Mercury Management Approach</b>). In contrast, non-radiological pollutants must have discharge criteria or limits that are applied at the point of discharge and are based on the most stringent among limits based on technology, water quality, and for the unavailable parameters (mercury and PCBs), the antidegradation statement consistent with the CWA and TDEC Water Quality Standards regulations.<sup>11</sup> Please note that for the TBELs, non-treatment techniques such as in-stream aerators and flow augmentation are generally is not an acceptable “treatment” to achieve TBELs for non-radiological pollutants unless a non-treatment technique is approved by EPA and TDEC. Landfill wastewater will need to be measured for compliance with effluent limits prior to any commingling of wastewater with storm water.<sup>12</sup></p> <p><sup>11</sup> Ref. TDEC 0400-40-03.02(4), TDEC 0400-40-03.05(6), TDEC 0400-40-03.06(2) and CWA §§ 301(b)(1)(C), 401(a)(1); see also 40 CFR § 122.44(d), “No permit may be issued... [w]hen the imposition of conditions cannot ensure compliance with the applicable water quality requirements of all affected States.”</p> <p><sup>12</sup> See 40 CFR § 125.3(f) Technology-based treatment requirements cannot be satisfied through the use of “non-treatment” techniques such as flow augmentation and instream mechanical aerators. However, these techniques may be considered as a method of achieving water quality standards on a case-by-case basis when: (1) The technology-based treatment requirements applicable to the discharge are not sufficient to achieve the standards; (2) The discharger agrees to waive any opportunity to request a variance under section 301 (c), (g) or (h) of the Act; and (3) The discharger demonstrates that such a technique is the preferred environmental and economic method to achieve the standards after consideration of alternatives such as advanced waste treatment, recycle and reuse, land disposal, changes in operating methods, and other available methods.</p> | <p>See Response to General Comment 1.</p> <p>Agree. As discussed in other sections of the responses to EPA comments, DOE has agreed to include in the D2 ROD the 40 <i>CFR</i> 445 technology-based effluent limits for RCRA hazardous waste landfills. Discharges of landfill wastewater will comply with this technology-based standard, as well as the water quality and antidegradation requirements of the TDEC Water Quality Standards identified in the D1 ROD ARARs.</p> |

| D        | 107         | Sect. 2.12.2.4<br>p. 2-46 | <p>Decision Summary</p> <p>The fourth paragraph gives inaccurate information about the discharge ARARs for radionuclides. First, it omits Clean Water Act requirements as relevant and appropriate requirements for the discharge to surface water of radionuclides as identified in the Wheeler Decision. It errs further in suggesting that complying with ARARs (namely water quality-based effluent limits for radionuclides) is at any point other than at the end of pipe where it discharges into surface water.<sup>13</sup> In addition, it is premature to state that the discharge will meet the ARAR of AWQCs for radionuclides being developed at a 10E-5 risk level because there are neither AWQCs or discharge limits to meet those AWQCs (or antidegradation-based limits, as appropriate) in the ROD.<sup>14</sup> EPA is aware that water quality values for radionuclides and associated effluent limits are being developed and the FFS is being revised. EPA expects this information to be in the revised ROD.</p> <p><sup>13</sup> The ROD states that the nearest point of public exposure is downstream from the discharge point. While this may be how DOE measures compliance under its Orders for dose-based limits, in a CERCLA action, where there are multiple ARARs, it is a fundamental principle of CERCLA that the most stringent ARAR must be met. 55 Fed Reg 8741.</p> <p><sup>14</sup> The D3 FFS does not contain AWQCs, and the discharge limits in the D3 FFS are based on exposure assumptions (1 meal per year of fish of approximately 170 grams) that do not have a factual or scientifically-defensible basis (consistent with Clean Water Act guidance on how to conduct a fish consumption survey).</p> | <p>Agree. Text has been modified to note that radiological discharges to surface water are compliant with the CWA as it is relevant and appropriate to radiological contaminants. Reference to the location of compliance was removed.</p> <p>The specific remediation goals for landfill wastewater are specified in the D2 ROD (Sect. 2.12.2.4). The approach was agreed upon among the FFA parties. The discharge limits will be developed in the future, based on the remediation goals, when the specifics of the EMDF landfill wastewater treatment systems are known, including the discharge location. The remediation goals and future discharge limits are within the CERCLA risk range and protective of Human Health and the Environment.</p> |
| E        | 108         | Sect. 2.12.2.4<br>p. 2-46 | <p>Description of EMDF operations</p> <p>The text states:</p> <p>Regarding discharge of radionuclides contained in landfill wastewater, the ROD includes TDEC 0400-20-11-.16(2) [equivalent to 10 <i>CFR</i> 61.41] and TDEC 0400-20-11-.16(4) [equivalent to 10 <i>CFR</i> 61.43]. These ARARs, developed by the NRC, provide and refer to dose limits for protecting the public. Compliance with the ARARs is required at the nearest point of public exposure, which is downstream from the facility. Radiological discharge limits (RDLs) are in compliance with the 10-5 risk specified in the Dispute Resolution Decision<sup>6</sup> and consistent with TDEC 0400-40-03-.03(4)(j) Footnote C, as determined based on site-specific exposure assumptions. Compliance with these discharge limits will assure human health and the environment are fully protected to the requirements of CERCLA.</p> <p>The water quality-based discharge limits for radionuclides are required to use the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Clarification provided. The text [now Sect. 2.12.2.5] has been revised to better clarify compliance with discharge limits and refer to the discharge limit discussion (Sect. 2.12.2.4).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|----------|-------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
|          |             |                           | <p>10-5 target risk specified in the TDEC 0400-40-03-.03(4)(j) Footnote C as stated in the Dispute Resolution Decision (footnote 6). As stated in another comment, the derivation of water quality-based effluent limits for radionuclides should be in compliance with the most stringent ARAR which includes identified EPA CWA and TDEC regulations, as opposed to NRC dose-based limits which the ROD language above implies. Until effluent limits for all hazardous substances (including radionuclides) have been derived in compliance with identified ARARs and approved by EPA it is presumptuous to make this statement in the ROD. Further, CERCLA Section 121(b) requires that remedial action simply be “protective of human health and the environment.” Accordingly, either delete the sentence or revise to better reflect that compliance with effluent limits derived in accordance with CWA ARARs to protect water quality and attain TDEC’s use classifications is part of the remedy that will be protective of human health and the environment.</p> |                              |
| D        | 109         | Sect. 2.12.2.4<br>p. 2-46 | <p>Description of EMDF operations, 4<sup>th</sup> paragraph discussing radionuclide discharge</p> <p>The paragraph discussing radionuclide discharge is ambiguous and not fully consistent with the EPA Administrator dispute decision. For example, the text refers to ARARs with dose-based limits and doesn’t mention CWA ARARs for radionuclide discharge. The paragraph says that the standard applies at the point of public exposure, then later says that discharge limits (in compliance with 10E-5) will be implemented at the point of discharge. This creates some ambiguity about whether 10E-5 will be met throughout the water body. Please revise text to be consistent with the Administrator decision.</p>                                                                                                                                                                                                                                                                                                                                                | See response to Comment 107. |
| D        | 110         | Sect. 2.12.2.4<br>p. 2-46 | <p>Description of EMDF operations</p> <p>Dilution and distance are being used (see EPA’s 7/22/21 comments on the June, 2021 revised FFS Appendix K). This approach is not consistent with relevant and appropriate CWA regulations, is not consistent with CERCLA and the NCP (for example, compliance with substantive requirements in ARARs), and does not ensure protectiveness of human health and the environment as required by CERCLA. Revise this section consistent with the final agreement documented in the revised and approved FFS.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | See response to Comment 107. |

| A        | 111         | Sect. 2.12.2.4<br>p. 2-46 | <p>Description of EMDF operations</p> <p>The text implies that NRC regulations (not CWA regulations) are the ARARs being used for purposes of wastewater discharge effluent limits (see p. 2-46 and 2-50). To the extent the NRC regulations are not as stringent as the relevant and appropriate CWA regulations, this approach is not consistent with the NCP and as discussed in the preamble to the final NCP, this approach does not ensure protectiveness of human health and the environment as required by CERCLA. The text should be revised to add CWA regulations as ARARs.</p>                                                                                                | See response to Comment 107.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| D        | 112         | Sect. 2.12.2.4<br>p. 2-46 | <p>Description of EMDF operations</p> <p>The text refers to a "...wastewater treatment system...sized to accommodate the estimated wastewater volume to be treated and designed to remove contaminants projected to exceed discharge criteria". Text should be added that explains the plans to minimize leachate or contact water generation during later phases of landfill operation.</p>                                                                                                                                                                                                                                                                                              | Agree. The following text was added at the end of this paragraph: "As a best management practice, landfill wastewater generation will be minimized by keeping the number of cells open to the minimum required by operations and placing temporary precipitation/clean stormwater controls to divert clean stormwater out of the disposal cells."                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| E        | 113         | Sect. 2.12.2.6<br>p. 2-47 | <p>Maintenance activities and environmental monitoring</p> <p>"Surveillance and maintenance (S&amp;M) and performance monitoring will be implemented during operation and after facility closure." If performance monitoring shows that the landfill is not functioning properly, not meeting ARARs and/or posing an unacceptable risk to human health and the environment, what are the specific criteria to trigger the need to revisit the remedy? Have contingency plans been considered in the event the landfill impacts groundwater? It may be helpful to identify these triggers in the ROD so that the FFA parties have a clearer understanding of potential future actions.</p> | <p>Clarification provided. Text later in this section addresses more detail regarding the monitoring activities. Details will be provided in future CERCLA documents as stated, that are approved by the FFA parties and follow ARARs as noted. The following text was added to clarify.</p> <p>"Baseline groundwater conditions for a detection monitoring program must be documented before disposal facility operations begin. Results from at least four consecutive quarters of water quality sampling and laboratory analysis must be reported to establish baseline water quality to be used as a basis for future monitoring. Details concerning operational and post-closure monitoring, including criteria for determining the protectiveness of the remedy and any need to take action, will be specified in future post-ROD CERCLA documents, to be approved by the FFA parties. The requirements for monitoring and reporting groundwater, surface water, stormwater, landfill wastewater, and ambient air monitoring will be carried out as required in compliance with the ARARs included in Appendix A."</p> |

| E        | 114         | Sect. 2.12.2.7<br>p. 2-47 | <p>Decision Summary</p> <p>These comments are provided in order to ensure that the land use controls selected in the EMDF are consistent with EPA's guidance, <u><i>Sample Federal Facility Land Use Control ROD Checklist with Suggested Language</i></u>, OSWER Directive 9355.6-12, January 4, 2013.</p> <p>a. Please include a (labeled) map or figure showing boundaries and/or location of the land use controls. (Checklist Item 1)</p> <p>b. In the list of LUC objectives, please substitute the phrase "DOE-controlled industrial use (waste management)" for "alternate" to ensure that the concise list of objectives effectively communicates the objectives. (Checklist Item 4)</p> <p>c. Please include a LUC objective to "Maintain the integrity of any current or future remedial monitoring system such as monitoring wells, permeable reaction barriers." (Checklist Item 4)</p> <p>d. Please add a LUC objective to "maintain the soil cover once it is put in place at each waste cell to limit ecological impact." (Checklist Item 4)</p> <p>e. Please add a LUC objective to "maintain a cover at landfill closure that prevents inadvertent intrusion into the waste." (Checklist Item 4)</p> <p>f. Please clarify whether ORR will put a notice in a facility plan that includes a description of the allowed and prohibited uses at the site. (Checklist Item 5)</p> <p>g. Please include the following statement, "Land Use Controls will be maintained until the concentration of hazardous substances in the soil and groundwater are at such levels to allow for unrestricted use and exposure." (Checklist Item 6)</p> <p>h. Please include a statement that "DOE is responsible for implementing, maintaining, reporting on, and enforcing the land use controls." (Checklist Item 7)</p> <p>i. Please include the following language, "A LUC Remedial Design will be prepared as the land use component of the Remedial Design. Within 90 days of ROD signature, or as part of the Remedial Design for the EMDF, DOE shall prepare and submit to EPA for review and approval a LUC remedial design that shall contain implementation and maintenance actions, including periodic inspections." (Checklist Item 9)</p> | <p>a. Agree. Figure 2.5 has been updated to include a boundary for land use controls.</p> <p>b. Agree, completed.</p> <p>c. Agree, however, permeable reaction barriers are not part of the remedy and will not be listed.</p> <p>d. Clarification provided, soil cover is part of the final cover, which was added to objectives.</p> <p>e. See response to item d. above, and also the first bullet of the objectives.</p> <p>f. Agree, footnote 'a' was updated.</p> <p>g. Agree, completed.</p> <p>h. Agree, completed.</p> <p>i. Agree, similar language was provided. However, some details would be specified in a document at closure of the landfill and are premature to be written into a LUCIP at this time.</p> |

| E        | 115         | Sect. 2.12.2.7<br>p. 2-47                               | Land use controls<br><br>Please apply the LUC Checklist, and clearly differentiate Zones 1-3. This section is missing items from the LUC Checklist: specifically, items 6-9; list of prohibited activities relating to industrial use. (Additional details are provided in the previous comment.) Please address and include in the revised ROD.                                                                                                                                                                | Clarification provided. The details for Zones 1, 2, and 3 are provided in the BCV RAR CMP. The ROD now states that the BCV RAR CMP will be updated.<br><br>Items 6-9 are addressed in the response to Comment 114, and were incorporated in the ROD, with minor word changes to fit the presentation of information. |
| E        | 116         | Sect. 2.12.2.7<br>p. 2-47                               | Land use controls<br><br>It is not clear what the Performance Action Objectives are for Zone 1, 2, and 3. Please differentiate the LUC for each area. Note that EPA's 1999 ROD Guidance states "Present a clear statement of the specific RAOs for the operable unit or site and reference a list or table of the individual performance standards." Address these issues in the revised ROD.                                                                                                                   | Clarification provided. The RAOs are clearly given in the ROD. The RAOs are not dependent on Zone 1, 2, or 3.                                                                                                                                                                                                        |
| E        | 117         | Sect. 2.12.2.7<br>p. 2-47                               | Land use controls<br><br>Please identify the LUC instrument that will be used.                                                                                                                                                                                                                                                                                                                                                                                                                                  | Agree. Both the BCV RAR CMP and the CERCLA waste disposal LUCIP have been noted as containing land use controls and are required to be updated.                                                                                                                                                                      |
| E        | 118         | Sect. 2.12.2.7<br>p. 2-47                               | Land use controls<br><br>Please include the following language: "Although DOE may later transfer these procedural responsibilities to another party by contract, property transfer agreement, or through other means, DOE shall retain ultimate responsibility for remedy performance and integrity."                                                                                                                                                                                                           | Agree. Statement was added to text.                                                                                                                                                                                                                                                                                  |
| C        | 119         | Sect. 2.12.3<br>p. 2-48<br>and<br>Table 2.8<br>pg. 2-49 | Cost Estimate for the Selected Remedy<br><br>Based on Section 2.12.3 and Table 2.8, present worth costs for the alternatives were calculated using a real discount rate of 1.5 percent according to the Office of Management and Budget (OMB) Circular No. A-94, dated November 2016; however, it is appropriate to use the OMB Circular No. A-94, dated December 2020 to ensure the ROD meets the costing requirements outlined in the ROD Guidance. Revise the ROD to utilize the current real discount rate. | Agree. The newer discount rate was used to calculate PW for all alternatives. Tables and text have been updated. The 2021 discount rate for 30+ years is now -0.3% (as opposed to 1.5% from 2016). This causes the PW estimates to be higher than the FY2021 constant dollar estimates.                              |

| Category | Comment No. | Sect/<br>Page           | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------|-------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C        | 120         | Sect. 2.12.3<br>p. 2-49 | <p>Cost Estimate for the Selected Remedy</p> <p>Table 2-8 (Total estimated project costs) includes the costs associated with the construction of Cell 5; however, the ROD, including Section 2.12.3 (Cost Estimate for the Selected Remedy), does not propose construction of five cells. Based on Figure 2.5 (EMDF conceptual site layout) and the text, only four cells are proposed. If Cell 5 will not be constructed, revise Table 2-8 to only include the costs associated with the construction of Cells 1-4. If Cell 5 will be constructed, revise the ROD to consistently present construction of five cells across Site 7c</p>                                                                                                 | <p>Clarification provided. The conceptual design (which the RI/FS estimates were built on) was five cells; however, the preliminary design decreased to four cells. The overall capacity is the same for both designs, and the cost difference is minimal as is stated in the ROD (the only difference between the 5 and 4 cells is an additional internal berm, some leachate lines, etc., all minor costs). The table (now Table 2.9) has been revised to note 4 cells (the first phase will construct Cells 1 and 2 instead of 1, 2, and 3).</p> |
| T        | 121         | Sect. 2.12.4<br>p. 2-49 | <p>Decision Summary</p> <p>The first paragraph states that the remedy will meet RAOs, will be protective of human health and the environment, will protect human and ecological receptors, and will prevent adverse impacts to surface water. As noted in other comments, there currently is no factual basis in the D1 ROD or the Administrative Record for this ROD to support any of these statements. Until there is a factual record to support them, the ROD is inconsistent with CERCLA, the NCP and the FFA. EPA expects this issue to be addressed in the revised FFS and incorporated in the next version of the ROD.</p>                                                                                                      | <p>Disagree in part. The specific remediation goals for landfill wastewater are specified in the D2 ROD (Sect. 2.12.2.4). The approach was agreed upon among the FFA parties. The discharge limits will be developed in the future, based on the remediation goals, when the specifics of the EMDF landfill wastewater treatment systems are known, including the discharge location. The remediation goals and future discharge limits are within the CERCLA risk range and protective of Human Health and the Environment.</p>                    |
| E        | 122         | Sect. 2.12.4<br>p. 2-49 | <p>Expected Outcomes of the Selected Remedy</p> <p>Text in Section 2.12.4 indicated wetlands mitigation would be implemented as required by ARARs. However, the text did not describe controls to prevent disruption of, impact to, or alteration of wetlands and how effectiveness of such controls would be measured using EPA's wetlands guidance with the goal of "no net loss": <a href="https://www.epa.gov/cwa-404/background-about-compensatory-mitigation-requirements-under-cwasection-404">https://www.epa.gov/cwa-404/background-about-compensatory-mitigation-requirements-under-cwasection-404</a>. If loss is anticipated, outline the process by which on-site or off-site compensatory mitigation will be proposed.</p> | <p>Clarification provided. Text was added to this section to address mitigation efforts at a high level.</p> <p>"Best Management Practices will be used to avoid impacts to wetlands and minimize unavoidable impacts as much as possible. Where impacts will be unavoidable, appropriate regulatory agencies will be contacted and discussions regarding mitigations efforts will be held. It is expected that various compensatory measures will be investigated."</p>                                                                            |
| E        | 123         | Sect. 2.13.1<br>p. 2-50 | <p>Overall Protection of Human Health and the Environment Please add reference to the groundwater RAO in this paragraph.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Agree. Text was added that states:</p> <p>RAOs to protect water resources (surface water and groundwater) are provided, that in turn protect human health and the environment.</p>                                                                                                                                                                                                                                                                                                                                                               |

| Category | Comment No. | Sect/<br>Page           | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Response                                                                                                                         |
|----------|-------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| A        | 124         | Sect. 2.13.2<br>p. 2-50 | <p>Compliance with ARARs</p> <p>The text suggests NRC regulations (not CWA regulations) are the ARARs being used for purposes of wastewater discharge effluent limits (see p. 2-46 and 2-50). To the extent the NRC regulations are not as stringent as the relevant and appropriate CWA regulations, this approach is not consistent with the NCP and as discussed in the preamble to the final NCP, this approach does not ensure protectiveness of human health and the environment as required by CERCLA. Hopefully, this issue is resolved in the revised Wastewater FFS and in the revised ROD.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                      | Agree. The text has been clarified to be inclusive of all ARARs being used to develop wastewater discharge effluent limitations. |
| E        | 125         | Sect. 2.13.2<br>p. 2-50 | <p>Decision Summary</p> <p>The fourth paragraph states that waste may be accepted for disposal even if it is not located at the NPL site. The term <i>on-site</i> means the areal extent of contamination and all suitable areas in very close proximity to the contamination necessary for implementation of the response action” 40 CFR 300.400(e)(1). Any decision to dispose of DOE legacy waste must be made through the CERCLA remedy selection process under the ORR FFA including a CERCLA decision document that is approved by EPA and TDEC. Please add text to clarify this issue under the FFA.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                | See response to Specific Comment 34.                                                                                             |
| A        | 126         | Sect. 2.13.2<br>p. 2-50 | <p>Decision Summary</p> <p>The fifth paragraph states, “The following NRC-based TDEC regulations are relevant and appropriate: TDEC 0400-20-11-.16(2) [equivalent to 10 CFR 61.41] and TDEC 0400-20-11-.16(4) [equivalent to 10 CFR 61.43]. These ARARs are used along with site-specific parameters to develop limits on radiological discharges during operations that ensure protection of human health and the environment.” While this statement is consistent with the Wheeler Decision, it also omits a key principle of that Decision that Clean Water Act requirements are <b>also</b> relevant and appropriate requirements for the development of AWQC equivalents and discharge limits for radionuclides. The sentence should be revised to acknowledge that identified CWA NPDES regulations and TDEC Water Quality Standards are also ARARs used to derive water quality-based effluent limits. As noted above, where there are multiple ARARs, the most stringent requirement must be met. Please revise text accordingly..</p> | See response to Specific Comment 124.                                                                                            |
| A        | 127         | Sect. 2.13.2.1          | Decision Summary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Agree. Text revisions were made to address concerns in the                                                                       |

|----------|-------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|          |             | p. 2-51       | <p>This section describes the basis of the waivers from the TSCA requirements, including the requirement that “[t]he bottom of the landfill liner system or natural in-place soil barrier shall be at least fifty feet from the historical high-water table.” The document states waivers are being conducted under CERCLA Section 121(d)(4) [equivalent standard of protectiveness ARAR wavier]. This is not correct and was one of the issues raised by EPA and dealt with under the resolution of the RI/FS dispute (in the DRA attachment Appendix G). Please correct the text by removing discussion of waivers under CERCLA 121(d)(4) and clarify that the waivers are being evaluated under TSCA (40 CFR 761.75(c)) and the Department of Radiation Health (TDEC 0400-20- 04-.08)).</p> <p>In addition, this section states that certain TSCA requirements in 40 CFR § 761.75(b)(3) <i>Hydrologic conditions</i> have been met because DOE concludes that this is a post-construction requirement. EPA did not agree with DOE’s assertion during the RI/FS dispute and as a result negotiated an Appendix G with an explanation of the TSCA requirements being waived (included as an attachment to the December 7, 2017 Dispute Resolution Agreement). This TSCA regulation includes certain requirements that are tied to design and others that are more like siting requirements (which could be identified as a location-specific ARAR) and specifies the condition of the site in order for a TSCA landfill location selection; it is not a post-construction requirement whose compliance is determined after site preparation or landfill construction. Please revise the ROD to clarify that DOE is seeking a waiver under 40 CFR 761.75(c)(4) as part of the selected remedy described in this ROD to both requirements in 40 CFR 761.75(b)(3) including: “There shall be no hydraulic connection between the site and standing or flowing surface water”; and “The bottom of the landfill liner system or natural in-place soil barrier shall be at least fifty feet from the historical high-water table.” The waiver of both of these requirements is based on the same justification that relate mostly to compliance with more stringent landfill design and construction requirements that establish a buffer from connection with surface and groundwater.</p> <p>Further, the ARAR waiver discussion in the RI/FS Appendix G had significantly more information than is presented in the ROD. Please explain why that information from Appendix G which EPA considered necessary or helpful in demonstrating the basis for the waiver ( as well as the additional requirement that,despite the waiver, the remedy is protective under CERCLA) has been omitted.</p> <p>Please note that a post ROD waiver of any identified ARAR would require another EPA approved decision document AROD or ESD providing justification for</p> | comment. |

|          |             |                           | invoking a waiver as required by the NCP at 40 CFR § 300.430(f)(5)(ii).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                             |
| A        | 128         | Sect. 2.13.2.1<br>p. 2-51 | <p>Waiver to TSCA 40 CFR 761.75(c)(4)</p> <p>The text states:</p> <p>DOE justifies a waiver of the TSCA hydrologic conditions requirement on the basis that the EMDF will be at least as protective due to the following design elements, which provide protectiveness exceeding that provided through the siting requirements (please note that floodplains and shorelands are being avoided and that the site will have monitoring wells and leachate collection):</p> <ul style="list-style-type: none"> <li>• More stringent liner and leachate detection and collection requirements under RCRA</li> <li>• Low permeability vadose zone geologic buffer material as committed to in this ROD.</li> </ul> <p>A third bullet must be added which states:</p> <ul style="list-style-type: none"> <li>• A groundwater monitoring network around the EMDF compliant with RCRA requirements.</li> </ul>                                                     | Agree. Text revised as suggested.                                                                                                                                                                                           |
| D        | 129         | Sect. 2.13.2.3<br>p. 2-54 | <p>Radiological Discharge Limits</p> <p>All of the data to be collected under the EPA Administrator’s decision is to be documented in the revised <i>Focused Feasibility Study for Water Management for the Disposal of CERCLA Waste on the Oak Ridge Reservation, Oak Ridge, Tennessee</i> (DOE/OR/01-2664&amp;D3). This FFS is to remain open and run parallel to the completion of the D2 EMDF ROD. The FFS will be revised to include the radionuclide-specific fish data have been collected, and the derived water quality values for radionuclides. Following approval, the FFS will then be placed in the Administrative Record for public availability. The public will be informed of the contents of the FFS through specific public outreach activities before the D2 EMDF ROD is approved and signed by the EPA Administrator. All of the information stated above must be included in this section of the EMDF ROD to inform the public.</p> | <p>Agree. The following text was added to the second paragraph in this section. “The results of the fish tissue studies and development of the PRGs are included in the FFS.</p> <p>[Note: this is now Sect. 2.12.2.4.]</p> |

| T        | 130         | Sect. 2.13.2.3<br>p. 2-54 and 2-55                   | <p>Decision Summary</p> <p>This section notes that radiological discharge limits will be included in the ROD prior to its approval. Without these discharge limits, there is no current basis for evaluation of the ROD's assertions that it is protective and attains ARARs, or, therefore, that it is consistent with CERCLA and the NCP. EPA expects that water quality values for radionuclides will be developed in the revised FFS and included in the next version of the ROD.</p> | <p>Agree. The specific remediation goals for landfill wastewater are specified in the D2 ROD (Sect. 2.12.2.4). The approach was agreed upon among the FFA parties. The discharge limits will be developed in the future, based on the remediation goals, when the specifics of the EMDF landfill wastewater treatment systems are known, including the discharge location. The remediation goals and future discharge limits are within the CERCLA risk range and protective of human health and the environment.</p> |
| E        | 131         | Sect. 2.13.5<br>p. 2-55                              | <p>Decision Summary</p> <p>This section states that treatment of CERCLA waste is not a component of the remedy. This is inaccurate. This action will generate CERCLA waste as wastewater and possibly other wastes, and as noted in the last sentence, at least this CERCLA wastewater will be treated. Please delete the first sentence.</p>                                                                                                                                             | <p>Agree. Sentence was deleted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| S        | 136         | Sect. 2.14<br>p. 2-56   | <p>Documentation of Significant Changes</p> <p>According to Section 2.14, a slight modification to the eastern boundary of the landfill was made as part of the conceptual design process “but it does not change any of the evaluation of alternatives including demonstration of protectiveness or compliance with ARARs;” however, the reason for this modification is not discussed. This modification is of particular note given the location of the Douglas Chapel Cemetery, as shown on Figure 2.3 (Phase I characterization and site characteristics of the EMDF site), to the eastern boundary. Revise the ROD to clarify the reason for the modification to the eastern boundary of the landfill and to explain how it remains protective and compliant with ARARs.</p>                                                                                                                                                      | <p>Agree: The first paragraph of Sect. 2.14 was revised as follows:</p> <p>“Since the Proposed Plan was approved and released in September 2018, there have been no changes to the remedy. As part of the conceptual design process, a slight modification to the eastern boundary of the landfill was made to ensure sufficient separation between waste and groundwater immediately adjacent to D-10W, but this modification does not change any of the evaluation of alternatives, including demonstration of protectiveness or compliance with ARARs.”</p> |
| E        | 137         | Fig. 2.6<br>p. 2-58     | <p>Proposed Rail Waste Route at ETTP</p> <p>The figure identifies three separate areas across ETTP as “Retained By DOE.” All three sites are former landfills and collectively they comprise approximately 63 acres. These sacrifice areas will require perpetual DOE controls on both the land surface and any groundwater contamination originating from these areas. This is inconsistent with ROD text which states:</p> <p style="padding-left: 40px;">DOE’s current goal is to transfer all of ETP out of DOE ownership and for it to be beneficially reused. The creation of a waste handling facility is inconsistent with this goal and a deterrent to future beneficial reuse of the site.</p> <p>Please rewrite the text (above) to more accurately reflect DOE’s own anticipated Final Heritage Center End State Vision (shown in Figure 2.6) with perpetual sacrifice zones and include the proposed airport location.</p> | <p>Agree. Text has been revised to: “DOE’s current goal is to transfer major portions of ETTP out of DOE ownership and for it to be beneficially reused. The creation of a waste handling facility is inconsistent with this goal and a deterrent to future beneficial reuse of the site.”</p>                                                                                                                                                                                                                                                                 |
| E        | 138         | Sect. 2.14.1<br>p. 2-57 | <p>Impacts to Reindustrialization</p> <p>One statement in this section reads “...daily hauling of radioactive waste is inconsistent with the development of the National Historic Park.” This statement is unquestionably factual but would it not likewise in some sense apply to the removal and hauling of waste material and soils by truck from at least some of the same source areas to the EMDF? If so, then citing the movement of radioactive or other waste materials by rail as a negative aspect of the off-site disposal option would seem to be a misplaced argument for favoring onsite over offsite disposal unless it is presented in a comparative analysis to the waste handling and hauling elements of the onsite disposal option. Please clarify.</p>                                                                                                                                                            | <p>Clarification provided. By the time EMDF is operational, there will no longer be any ongoing remediation at the ETTP site and few if any waste transfers from that site to EMDF. No change to text is needed.</p>                                                                                                                                                                                                                                                                                                                                           |

| E        | 139         | Sect. 2.14.3<br>p. 2-60 | Groundwater Field Demonstration<br><br>This section should be moved to the selected remedy section.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Disagree. This section describes additional characterization performed at the FFA parties' request to inform the design and is not part of the remedy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| P        | 140         |                         | Responsiveness Summary<br><br>There are several instances in the responsiveness summary and elsewhere in the document that state waivers are being conducted under CERCLA Section 121(d)(4), the "equivalent standard of protectiveness" ARAR wavier. This is not correct and was one of the issues raised by EPA and addressed by the resolution of the RI/FS dispute (in the DRA attachment Appendix G). Please correct any responses by removing discussion of waivers under CERCLA 121(d)(4) and clarify that the waivers are being evaluated under TSCA (40 CFR 761.75(c)) and the Department of Radiation Health (TDEC 0400-20-04-.08)). | Agree. The responsiveness summary has been revised in all instances to remove reference to CERCLA 121(d)(4), and clarify how the waiver and exemption are being evaluated under TSCA 40 CFR 761.75(c)(4) and TDEC 0400-20-04-.08, respectively.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| P        | 141         |                         | Responsiveness Summary<br><br>The ROD text of Section 2.10.5 notes: "The greatest impact would be installation of EMDF in CBCV or WBCV, where up to 94 acres of forested land would be expected to be impacted. The other onsite alternatives had less, but still notable, impact on environmental habitat." The remedy decision impacts forested lands. Some of the responses asked why DOE is building this landfill in a green area, and a complete response was not provided. Please address this issue in the revised responsiveness summary.                                                                                             | Agree. In response to questions about siting the EMDF in a "greenfield", the Responsiveness Summary addresses the process for the selection of Site 7c, including that the site is not being considered for reindustrialization, is in the same valley as the existing EMWMF and several other CERLCA areas, the location allows for hydrologic separation from Pine Ridge, has favorable topography for design considerations, and was agreed to by the FFA parties in part based on a strong preference by the State related to the site's hydrology.<br><br>Several locations in the responsiveness summary, where a comment asked about building a landfill in a green area, the following statement was added:<br><br>"DOE considered all brown field sites first, but ultimately the Central Bear Creek Valley site provided the most beneficial attributes in total over those other sites." |

Reference has been added to the D2 ROD.                                                                                                                                                                                                                                                                 |
| P        | 146         | p. 3-3                              | <p>Responsiveness Summary</p> <p>The text states, “The Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) public comment periods are only required to span 30 days. OREM’s public comment period for the Proposed Plan was 120 days (September 10, 2018-January 9, 2019) to ensure all interested parties had time to review and provide comments on the document. Two extensions were granted while the original comment period was set at 45 days.” This comment is misleading. Please update this response with the language from the NCP - specifically, NCP 40 C.F.R. §300.430(f)(3)(i)(C). According to the NCP, DOE is to provide a reasonable opportunity, not less than 30 calendar days, for submission of written and oral comments on the Proposed Plan and the supporting analysis and information that already resides in the information repository (e.g., RI/FS). The NCP further requires, that upon timely request, the lead agency will extend the public comment period by a minimum of 30 additional days. Rather than stating “only required to span 30 days” the text should clarify that the NCP requires a period no less than 30 days with opportunities for extensions based on public interest.</p> | Agree, text was changed to note the CERCLA time frame for public comment on a proposed plan is no less than 30 days and are expanded based on public interest.                                                                                                                                                 |

The 2019 measured rainfall (per the Bear Creek Valley information) was 69.7 in. for 2019, and 71.3 in. for 2020. Text was added to note 70 and 71 in., respectively, for those years.</p> <p>Text was added to describe the climate resiliency provided by the selected remedy.</p> |

| P        | 149         | p. 3-6 and 307 | <p>Socioeconomic impact</p> <p>The text states:</p> <p>To the contrary, jobs associated with construction and operation of the facility, and the acceleration of cleanup enabled by onsite disposal and subsequent opportunities that [it] would present to the Y-12 and Oak Ridge National Laboratory, are expected to benefit both the economy and perception issues associated with environmental conditions in Oak Ridge. (Bold added)</p> <p>Please insert the word “it” where indicated by brackets above or rewrite for better clarity.</p>                              | <p>Agree. Text has been revised as suggested.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| P        | 150         | p. 3-55        | <p>Responsiveness Summary</p> <p>DOE states several times throughout the responsiveness summary: <i>“The developed WAC are anticipated to require nearly 90 percent of the radiological content in the low volume/highly contaminated waste streams to be sent offsite for disposal while the lower contaminated/high volume waste streams remain onsite.”</i> Update this response to clarify the criteria for offsite waste disposal including the type and estimated volume of waste. Provide definitions for “lower contaminated” and “highly contaminated” in the ROD.</p> | <p>Agree. The response has been updated as below. Also see the response to General Comment 6 for more on the definitions of LLW and higher activity waste in the ROD.</p> <p>RI/FSs for disposal facilities sometimes contain placeholder WAC, as was done for EMDF. The Proposed Plan then includes general information on the components of the WAC. This was the case for EMDF in which the Proposed Plan generally described the WAC and the process for obtaining final approval. WAC are contained in this ROD. Most of these WAC result from existing state and federal environmental regulations that are included in this ROD as applicable or relevant and appropriate requirements. <del>The developed WAC are anticipated to require nearly 90 percent of the radiological content in the low volume/highly contaminated waste streams to be sent offsite for disposal, while the lower contaminated/high volume waste streams remain onsite.</del> (Administrative WAC). These WAC prohibit the higher radioactive waste from being disposed. For example, transuranic waste, greater than Class C (Nuclear Regulatory Commission) waste, and other wastes that contain radioactivity in excess of the limits specified in this ROD are prohibited from disposal. Experience with cleanup projects on the ORR indicates the volume of waste that exceeds WAC and requires offsite disposal is less than 10 percent by volume, but contains greater than 90 percent of the radioactivity. Examples would include spent resins, some duct work, hot</p> |

|          |             |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | cell internals, and some equipment. Based on the projected inventory expected to be disposed in EMDF (consisting mainly of building demolition debris and soils) and in accordance with the WAC limits specified in Sect. 2.12.2.3 of this ROD, the final inventory of radionuclide contaminants will be protective of human health and the environment. These WAC limits will be implemented through the post-ROD, FFA parties-approved primary document, the WAC Compliance Plan. |
| P        | 151         |               | <p>Responsiveness Summary:</p> <p>The comments from 194 individuals along with DOE’s response is included in this section. In summary, the DOE identified the four general areas of supportive comments and responded with a standard response. Many of the unsupportive or opposing comments requested additional information such as:</p> <ul style="list-style-type: none"> <li>• Opportunity to review and comment on the waste acceptance criteria (WAC) prior to issuing with the ROD</li> <li>• Concerns with mercury-contaminated waste</li> <li>• Need for waivers for regulatory compliance</li> <li>• Oak Ridge’s underlying geology and rainfall</li> <li>• Overestimation of offsite disposal cost and risk</li> <li>• Impact of hazardous waste disposal site in Oak Ridge on home values and attracting people/businesses to Oak Ridge.</li> </ul> <p>The DOE developed a standard response addressing each of the concerns listed above. For several comments, the DOE provided the standard responses and included additional language specific to the public comment. However, not every response fully addressed the issues raised by the commenter. The following responses lack specificity and may not fully address the comment:</p> <ul style="list-style-type: none"> <li>• The standard responses provided did not address the subject or concern(s) of the public comment: Comments 114, 144, 149, 155, and 180.</li> <li>• Comment 107: <u>Bullet 3</u>: Add text that provides summary information from the Technical Memo 1 and 2, since this information was not formally presented in detail during the public comment period or at the Proposed Plan meeting.</li> <li>• Comment 115: The response does not address the citizen’s concern. For</li> </ul> | Agree. Responses have been revised to address concerns noted here.                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Category | Comment No. | Sect/<br>Page | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Response |

|          |             |               | <p>example, the DOE chose not to respond to the statement that, “Choosing a solution before all ground water impact testing is complete (per David Adler) just screams that a decision has already been made regardless of environmental impact.” The response should explain why shipping wastes to an area with an extremely low water table would not be preferable.</p> <ul style="list-style-type: none"> <li>• Comment 117: The response does not address the request for a required environmental impact statement (similar to Comment 128) and provides an insufficient response to questions regarding hydrogeology. Also, a better response to the reference to inappropriate disposal of waste at the EMWMF is to acknowledge these instances occurred and identify corrective measures implemented to preclude future occurrences.</li> <li>• Comment 118: The response does not address concerns that engineering design components (diversion structures, the gravel drains, the pipes, the liners, the caps) can be expected to fail. Also, a better response to the reference to inappropriate disposal of waste at the EMWMF is to acknowledge these instances occurred and identify corrective measures implemented to preclude future occurrences (similar to EPA review of response to Comment 117). DOE should provide an explanation of why the County Club Estates, did not experience direct DOE outreach efforts prior to issuance of the Propose Plan as other residents or organizations, since this community is nearest to the selected site. The DOE should revisit the response regarding the BCV ROD future use designation compared to setting remediation levels for cleanup for uncontaminated areas. Modify the DOE response to acknowledge site-specific characterization for Site 7c to fully support the selected remedy was not conducted at the time of the RI/FS, although generalized characterization information existed for Bear Creek Valley; however, information obtained from the Field Sampling Plan and reported in Technical Memorandum 1 and Technical Memorandum 2 provides more site information, but may not have been clearly presented in the Proposed Plan. Discuss the approach to mercury disposal being discussed between the FFA parties.</li> <li>• Comment 120: The DOE response did not address the concern regarding that the EMDF is outside areas where already dedicated to waste management and is not consistent with eh community’s plan for future use of the area. Please revise the DOE response.</li> <li>• Comment 122: The response does not address socioeconomic concerns or address the request for a cost-benefit analysis.</li> </ul> |          |

| A        | 152         | Appendix A<br>ARARs | <p>The RI/FS Appendix G attached to the 2017 Dispute Resolution Agreement included the following table of AWQCs as the first table in the tables of ARARs. Please include and add rows for any radionuclides that are likely to be in the waste stream, along with associated AWQC-equivalents for recreational use. (EPA is aware that these criteria are currently under development and expects the criteria to be in the next draft of the ROD.)</p>                 | <p>Agree. The table has been added in Sect. 2.12.2.4, Discharge Limits, with the agreed upon radiological AWQC equivalents. The ROD contains WQC to support both continuous and batch discharges, and determinations on following the criteria will be made in subsequent CERCLA documents.</p> |

Recreational criteria for noncarcinogenic chemicals are set using a 10<sup>-6</sup> risk level. [Note: All federal recreational criteria are set at a 10<sup>-6</sup> risk level].<br/> <sup>c</sup>In cases in which the in-stream AWQC or effluent limits established for an outfall are less than current chemical technological capabilities for analytical detection, compliance with the AWQC or limits will be determined using the higher RRLs, as allowed pursuant to TDEC 0400-40-03-.05(8).<br/> <sup>d</sup>Criteria are expressed as dissolved.<br/> <sup>e</sup>Criteria are expressed as dissolved and are a function of total hardness (mg/L). Criteria displayed correspond to a total hardness of 100 mg/L.</p> <p>ARARs = applicable or relevant and appropriate requirements<br/>                     AWQC = ambient water quality criteria<br/>                     CCC = criterion continuous concentration<br/>                     CMC = criterion maximum concentration<br/>                     COCs = contaminants of concern<br/>                     EMDF = Environmental Management Disposal Facility<br/>                     EMWMF = Environmental Management Waste Management Facility<br/>                     RRL = required reporting level<br/>                     TBC = to-be-considered [guidance]<br/>                     TDEC = Tennessee Department of Environment and Conservation</p> | Chemical                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Fish and Aquatic Life<br>[TDEC 0400-40-03-.03(3)]                 |  | Recreation <sup>b</sup><br>[TDEC 0400-40-03-.03(4)] | Required reporting level <sup>c</sup><br>[TDEC 0400-40-03-.05(8)] | Criterion maximum concentration (CMC)<br>(µg/L or ppb) | Criterion continuous concentration (CCC)<br>(µg/L or ppb) | Organisms only<br>(µg/L or ppb) | (RRL)<br>(µg/L or ppb) | Aldrin (c) | 3.0 |  | 0.00050 | 0.5 | Arsenic (c) |  |  | 10.0 | 1.0 | Arsenic (III) | 340 <sup>d</sup> | 150 <sup>d</sup> |  | 1.0 | b-BHC (c) |  |  | 0.17 |  | Cadmium | 2.0 <sup>e</sup> | 0.25 <sup>e</sup> |  | 1.0 | Chromium (III) | 570 <sup>d</sup> | 74 <sup>d</sup> |  | 1.0 | Chromium (VI) | 16 <sup>d</sup> | 11 <sup>d</sup> |  | 10.0 | Copper | 13 <sup>e</sup> | 9.0 <sup>e</sup> |  | 1.0 | Cyanide | 22 | 5.2 | 140 | 5.0 | 4,4'-DDT (b)(c) | 1.1 | 0.001 | 0.0022 | 0.1 | 4,4'-DDE (b)(c) |  |  | 0.0022 | 0.1 | 4,4'-DDD (b)(c) |  |  | 0.0031 | 0.1 | Dieldrin (b)(c) | 0.24 | 0.056 | 0.00054 | 0.05 | Lead | 65 <sup>e</sup> | 2.5 <sup>e</sup> |  | 1.0 | Mercury (b) | 1.4 <sup>d</sup> | 0.75 <sup>d</sup> | 0.051 | 0.2 | Nickel | 470 <sup>e</sup> | 52 <sup>e</sup> | 4600 | 10.0 |  |

A-3<br>Table A.1<br>2 <sup>nd</sup> row  | Radionuclide releases to the environment<br><br>This row only lists NRC regs (and TDEC equivalents) as RAR - CWA should be included here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Clarification provided. This requirement is a TDEC NRC requirement. As noted above, the ROD was revised to include the CWA as ARAR for the radiological discharges.                                                                                                                                                                                                                                                                                              |                                                                   |  |                                                     |                                                                   |                                                        |                                                           |                                 |                        |            |     |  |         |     |             |  |  |      |     |               |                  |                  |  |     |           |  |  |      |  |         |                  |                   |  |     |                |                  |                 |  |     |               |                 |                 |  |      |        |                 |                  |  |     |         |    |     |     |     |                 |     |       |        |     |                 |  |  |        |     |                 |  |  |        |     |                 |      |       |         |      |      |                 |                  |  |     |             |                  |                   |       |     |        |                  |                 |      |      |  |
| A               | 154                                                    | Appendix A,<br>ARARs, Table A-1,<br>p. A-3 through A-5    | The table does not identify the state water quality criteria as relevant and appropriate to radionuclides. Please add the following notation to the "Prerequisite" column, for all the water quality criteria: "Point source discharge of radionuclides into surface water – <b>relevant and appropriate.</b> " As with pollutants, this notation can be added in the first row only (but applies to all the similar citations below). In addition, please add the following note to the "Prerequisite" column for these citations, "NOTE: under TDEC 0400-40-03-.05 INTERPRETATION OF CRITERIA, mixing zones shall not apply to the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Agree. For the broad narrative criteria, which would encompass radionuclides, the water quality criteria has been added as relevant and appropriate. Some of the citations listed below this entry address constituents and parameters that would not be pertinent to radionuclides (i.e., oxygen, pH, hardness, visible solids, turbidity, temperature, iron, ammonia, nutrients, e-coli, biological integrity). These specific water quality requirements were |                                                                   |  |                                                     |                                                                   |                                                        |                                                           |                                 |                        |            |     |  |         |     |             |  |  |      |     |               |                  |                  |  |     |           |  |  |      |  |         |                  |                   |  |     |                |                  |                 |  |     |               |                 |                 |  |      |        |                 |                  |  |     |         |    |     |     |     |                 |     |       |        |     |                 |  |  |        |     |                 |  |  |        |     |                 |      |       |         |      |      |                 |                  |  |     |             |                  |                   |       |     |        |                  |                 |      |      |  |

For an action proposed in a wetland, the effects on the survival, quality, and function of the wetland shall be evaluated. | 10 CFR 1022.13(a)(2) | Agree. ARARs have been added. |
| <i>Project Description.</i> This section shall describe the proposed action and shall include a map showing its location with respect to the floodplain and/or wetland. For actions located in a floodplain, the nature and extent of the flood hazard shall be described, including the nature and extent of hazards associated with any high-hazard areas.                                                                                                                                                                                                                                     | 10 CFR 1022.13(a)(1) |                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                      |                               |
| <i>Floodplain or Wetland Impacts.</i> This section shall discuss the positive and negative, direct and indirect, and long- and short-term effects of the proposed action on the floodplain and/or wetland. This section shall include impacts on the natural and beneficial floodplain and wetland values (§ 1022.1) appropriate to the location under evaluation. In addition, the effects of a proposed floodplain action on lives and property shall be evaluated. For an action proposed in a wetland, the effects on the survival, quality, and function of the wetland shall be evaluated. | 10 CFR 1022.13(a)(2) |                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                      |                               |
| A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 156                  | Appendix A, ARARs, Table A-2, p. A-6 | <p>Wetland Requirements<br/>As mentioned by EPA R4 attorneys during ARARs meetings with DOE and TDEC, the EPA <i>Compensatory Mitigation for Losses of Aquatic Resources</i> rule at 40 CFR part 230 et. seq. may be considered ARARs for this remedy considering the anticipated removal of wetlands prior to construction of the EMDF. These regulations establish performance standards and criteria for the use of permittee-responsible compensatory mitigation, mitigation banks, and in-lieu programs to improve the quality and success of compensatory mitigation projects that should be evaluated along with the DOE and TDEC wetlands requirements that are currently included in the Location-specific ARARs table. Examples of these regulations are provided in the table labeled <b>Location-Specific Federal ARARs and TBCs for Wetlands [excludes CWA 404(b) requirements]</b> included in these comments.</p> <p>[Note: Table referenced in the comment is included at end of this response to comment table.]</p>                                                                                                                                                                                               | Agree. The appropriate ARARs have been added as suggested.                                                                                                                                                                                                                                                                                                                                                                                                    |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                      |                               |
| A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 157                  | Appendix A, ARARs, Table A-2, p. A-7 | DOE has added a citation to TDEC 0400-40-07-.04(7)(a) in the first row. Please remove it at this location, as this row discusses mitigation required for wetlands. This citation to subparagraph (a) is included on page A-13. In addition, please change the second “Citation” to TDEC 0400-40-07-.04(7)(b) (not (c)).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Clarification provided. The TN ARAP regulations were extensively reorganized in 2017 after the EMDF RIFS. Wetlands are now addressed in subsections (a) and (c) of TDEC 0400-40-07-04(7). Subsection (a) now addresses general mitigation requirements for streams and wetlands (prior regulations only addressed state waters other than wetlands in (a) and wetlands in (b)). Subsection (b) now addresses streams. Subsection (c) now gives the mitigation |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                      |                               |

| Category | Comment No. | Sect/<br>Page                                | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Response                                                                                                                                                                                                                                                                                                                                                                                              |

|          |             |                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | ratios for wetlands (subsection (c) is a new section added in the reorganized 2017 regulations). The ARAP regulations changed terminology from “waters other than wetlands” to “streams” due to the ARAP regulations now excluding wet weather conveyances from ARAP regulation and letting it be addressed by the Tennessee statute. The entries in the D1 ROD reflect the current ARAP regulations. |
| A        | 158         | Appendix A, ARARs, Table A-2, p. A-9         | The following citation was included in RI/FS Appendix G ARARs. Please include or explain why it is being removed.<br><br><div style="border: 1px solid black; padding: 2px; font-size: small;"> <span style="float: left; width: 30%;">Within an area potentially impacting "waters of the State" as defined in TCA 69-3-103(a2)</span> <span style="float: left; width: 30%;">• Must comply with the [substantive] requirements of the ARAP for erosion and sediment control to prevent pollution of waters of the state. Pollution control requirements are detailed in each particular General Permit.</span> <span style="float: left; width: 30%;">Action potentially altering the properties of any "waters of the State"—applicable</span> <span style="float: right; width: 10%;">TCA 69-3-108(1)<br/>TDEC 0400-40-07-.01</span> </div>                                                                                                                                                               | Clarification provided. This citation has not been removed. It appears under all of the individual ARAP General Permit entries consistent with format changes from the RI/FS.                                                                                                                                                                                                                         |
| A        | 159         | Appendix A, ARARs, Table A-2, p. A-9 to A-10 | The requirements for Bank Stabilization have been changed/reworded since the RI/FS Appendix G ARARs. Please explain the basis for the change. Please note in the last bullet that it should be revised to read: “Hard armoring bank stabilization treatment shall not exceed 300 linear feet for the treatment of one bank, or 200 linear feet per bank if the treatment includes both banks.”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Clarification provided. Since the RIFS, all of the ARAP General Permits, including Bank Stabilization, have been revised and reissued. The changes reflect the current text.<br><br>Agree. The last bullet on hard armoring has been revised as suggested to be more specific.                                                                                                                        |
| A        | 160         | Appendix A, ARARs, Table A-2, p. A-12        | The citation to TCA 69-3-108(q) seems to be unnecessary unless waters within the scope of this project have been designated by the state as wet weather conveyances. To EPA’s knowledge, this has not been done.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Clarification provided. In general, roadside ditches installed for stormwater purposes are potentially wet weather conveyances. They may flow into streams, but the road ditch itself would be a conveyance. Since such conveyances are likely to be included in EMDF design, this ARAR was retained in the event such conveyances need to be altered during operation, closure, or post-closure.     |
| A        | 161         | Appendix A, ARARs, Table A-2, p. A-13        | In the row with the citation to TDEC 0400-40-07-.04(7)(a), the “Requirements” column should be revised to reflect the language in the regulation: “If an applicant proposes an activity that would result in an appreciable permanent loss of resource value of a state water, the applicant must provide mitigation which results in no overall net loss of resource values. For any mitigation involving the relocation or re-creation of a stream segment, to the extent practicable, the applicant shall complete the mitigation before any impact occurs to the existing state waters. Mitigation measures include but are not limited to: 1. Restoration of degraded stream reaches and/or riparian zones; 2. New (relocated) stream channels; 3. Removal of pollutants from and hydrologic buffering of stormwater runoff; and 4. Any other measures which have a reasonable likelihood of increasing the resource value of a state water.” In addition, the existing language may be helpful, but its | Clarification provided. As discussed in the response to Comment 157, the TN ARAP regulations were extensively reorganized in 2017 after the EMDF RI/FS. This entry in the D1 ROD reflects the current ARAP regulations.                                                                                                                                                                               |

| Category                                                              | Comment No. A-17                                                                                                                  | <p>The citation notes that a waiver will be requested for a requirement or requirements in 40 CFR 761.75(b)(3). In the 12.7.17 Dispute Resolution Agreement attachment, RI/FS Appendix G, it noted that a waiver would be requested for some part of the following requirement: “The landfill must be located above the historical high groundwater table. Floodplains, shorelands, and groundwater recharge areas shall be avoided. The site shall have monitoring wells and leachate collection. There shall be no hydraulic connection between the site and standing or flowing surface water.” Please clarify if it is DOE’s position that a waiver is not being requested for requirements in this part, or if the one note applies to both paragraphs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Agree. Table has been modified to note the waiver applies to two parts in the requirement.</p> |                                                                                                                                                                                                                                                                     |                                                                                                                                                        |                                                                                           |  |                                                                                                                                                                                                                                                                                                                                                   |  |                                                                                   |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |                       |                                                                                                                                                           |

| A        | 164         | Appendix A, ARARs, Table A-2, p. A-17                       | <p>In the citation to 40 CFR 761.75(c), please add the following note, which was included in the 12.7.17 Dispute Resolution Agreement attachment, RI/FS Appendix G, at the bottom of the description in the “Requirements” column:</p> <p><i>Note: Waiver of any technical requirement shall be made as part of the CERCLA Record of Decision process. The CERCLA remedy protectiveness standard will apply in addition to the TSCA standard.</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Agree. Text revised as suggested.                                                                                                                                                                                                                                                                                 |
| A        | 165         | Appendix A, ARARs, Table A-2, p. A-19                       | <p>In the citation to TDEC 0400-20-04-.08, part of the note that was included in the 12.7.17 Dispute Resolution Agreement attachment, RI/FS Appendix G, has been removed. Please restore the second sentence in the note below, copied from that Appendix G:</p> <p><i>Note: The exemption, variance or exception from the requirement shall be made as of the CERCLA Record of Decision process. The CERCLA remedy protectiveness standard will apply in addition to the DRH standard.</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Agree. Text revised as suggested.                                                                                                                                                                                                                                                                                 |
| A        | 166         | Appendix A, ARARs, Table A-2, p. A-23 and where appropriate | <p>The following RCRA tank systems, surface impoundments, and container storage area requirements have been removed from the ROD, but were included in the 12.7.17 Dispute Resolution Agreement attachment, RI/FS Appendix G. Please explain the basis for not including those previously identified ARARs and how DOE intends to manage both contact wastewater from within the landfill and collected leachate. DOE is building a RCRA Subtitle C landfill, and EPA maintains that for prudent and protective operation of this landfill, these requirements should be included in case management of hazardous wastes generated by the landfill requires use of these types of units. As stated during several of the ARARs meetings with DOE and TDEC, the leachate collection system should include a tank compliant with the RCRA requirements in order to hold leachate for characterization prior to disposal in an NPDES permitted CWA wastewater treatment facility or disposal elsewhere in accordance with RCRA requirements for hazardous waste. While some of these requirements have been identified as relevant and appropriate to the operation of the landfill, others are considered legally applicable and may not be removed unless agreed to by EPA as part of the remedy selection for the EMDF.</p> | Clarification provided. These regulation were determined not to be legally applicable, Evaluation of these regulations was performed using the CERCLA NCP process (40 CFR 300.400[g][2]). These were determined to be not applicable, relevant or appropriate. See explanation provided at the end of these RTCs. |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Sect/<br>Page                                                                         | Comment Compaction will be performed as necessary to ensure a stable fill.</td> <td>Land disposal of solid waste—<b>relevant and appropriate</b></td> <td>TDEC 0400-11-01-04(3)(k)(1)</td> </tr> <tr> <td></td> <td>Emplaced solid wastes shall be covered with soil or other material of such depths and at such intervals as is necessary to prevent fire hazards, promote a stable fill, minimize potential harmful releases of solid wastes or solid waste constituents.</td> <td></td> <td>TDEC 0400-11-01-04(3)(k)(2)</td> </tr> </table> | Operation of a Subtitle D solid waste landfill | A facility must be operated and maintained in a manner to minimize litter. Fencing, diking and/or other practices shall be provided as necessary to confine solid wastes subject to dispersal. All litter must be collected for disposal in a timely manner.                                                                                                                                                                                                                                                   | Operation of a Subtitle D solid waste landfill— <b>relevant and appropriate</b>  | TDEC 0400-11-01-04(2)(d)                           |                                                  | There must be maintained on-site operating equipment capable of spreading and properly compacting the volume of solid wastes received, and capable of handling the earthwork required. Back-up equipment must be available within 24 hours of primary equipment breakdown. |  | TDEC 0400-11-01-04(2)(g) |  | Cover material sufficient to meet the initial and intermediate cover requirements of this rule must be available at the facility. If such material must be hauled in from off-site [i.e., off of ORR], at least a 30-day supply must be maintained on site at all times. [Note: Off-site, as referred to here, is assumed to mean off of the ORR.] |  | TDEC 0400-11-01-04(2)(h) |  | Collection and holding facilities associated with run-on and run-off control systems must be emptied or otherwise managed expeditiously after storms to maintain design capacity of the system. Run-on and run-off must be managed separately from leachate. Other control measures (e.g. temporary mulching or seeding, silt barriers) must be taken as necessary to control erosion of the site. |  | TDEC 0400-11-01-04(2)(i) |  | The operator must take dust control measures as necessary to prevent dust from creating a nuisance or safety hazard to adjacent landowners or to persons engaged in supervising, operating, and using the site. The use of any dust suppressants (other than water) must be approved prior to use. |  | TDEC 0400-11-01-04(2)(j) |  | There must be installed on-site a permanent benchmark (e.g., concrete marker) of known elevation. |  | TDEC 0400-11-01-04(2)(k) | Waste handling activities at a solid waste landfill | Solid waste disposal activities shall be confined to the smallest practicable area. Compaction will be performed as necessary to ensure a stable fill. | Land disposal of solid waste— <b>relevant and appropriate</b> | TDEC 0400-11-01-04(3)(k)(1) |  | Emplaced solid wastes shall be covered with soil or other material of such depths and at such intervals as is necessary to prevent fire hazards, promote a stable fill, minimize potential harmful releases of solid wastes or solid waste constituents. |  | TDEC 0400-11-01-04(3)(k)(2) | <p>TDEC 0400-11-01-.04(2)(d): Disagree. This requirement is designed for the specific wastes received by municipal waste landfills. The EMDF wastes will be receiving industrial wastes which, unlike municipal wastes, do not include litter-type waste subject to dispersal by wind. [Note: TDEC accepted not adding this ARAR.]</p> <p>TDEC 0400-11-01-.04(2)(g): Disagree. This bullet appears related to the last bullet where such machinery would be essential to the operation of a solid waste landfill where daily and intermediate cover is required under the solid waste regulations at municipal waste facilities. [Note: TDEC accepted not adding this ARAR.]</p> <p>TDEC 0400-11-01-.04(2)(h): Disagree. This bullet appears related to daily and intermediate cover, which is required for a solid waste landfill. It is anticipated that most cover material for EMDF will originate from the ORR. [Note: TDEC accepted not adding this ARAR.]</p> <p>TDEC 0400-11-01.04(2)(i): Agree. This requirement was restored to the ARARs.</p> <p>TDEC 0400-11-01.04(2)(j): Agree. This requirement was restored to the ARARs.</p> |

|                                                     | Collection and holding facilities associated with run-on and run-off control systems must be emptied or otherwise managed expeditiously after storms to maintain design capacity of the system. Run-on and run-off must be managed separately from leachate. Other control measures (e.g. temporary mulching or seeding, silt barriers) must be taken as necessary to control erosion of the site.                                                                                                             |                                                                                  | TDEC 0400-11-01-04(2)(i) A-34 and where appropriate      | <p>The following DOE Order Manual citations were included in the 12.7.17 Dispute Resolution Agreement attachment, RI/FS Appendix G ARARs table. No agreement was reached among the three FFA parties, but EPA believes that these citations are useful in ensuring protective handling of low-level radioactive waste at the EMDF. Please restore. See Footnote 11 in these comments, which indicates that the FFA Parties agreed in the December 7, 2017, Dispute Resolution Agreement on the EMDF RI/FS that this issue would be resolved prior to signature of the ROD. Note that the reference to EMWMF should be changed to EMDF. This error is an artifact because it was extracted from the EMWMF ROD, where the requirement is noted as a TBC.</p> <table border="1" data-bbox="619 646 1417 1187"> <tr> <td data-bbox="619 646 730 | A        | 174         | Appendix A, ARARs, Table A-2, p. A-50 | See the citation to 40 CFR 122.44(i)(1). The table omitted a requirement from subpart iii, noted in the January 19, 2021, letter to DOE from Peter Wright. Please include in the “Requirements” column along with (i) and (ii).<br><br>(iii) Other measurements as appropriate including pollutants in internal waste streams under § 122.45(i); pollutants in intake water for net limitations under § 122.45(f); frequency, rate of discharge, etc., for non-continuous discharges under § 122.45(e); pollutants subject to notification requirements under § 122.42(a); and pollutants in sewage sludge or other monitoring as specified in 40 CFR part 503; or as determined to be necessary on a case-by-case basis pursuant to section 405(d)(4) of the CWA. | Agree. This text was added to the ARAR requirement column. |
| A        | 175         | Appendix A, ARARs, Table A-2, p. A-52 | In the “Prerequisite” cell for the citation to 40 CFR 122.45(e), it should contain the following text: “Point source discharge of radionuclides into surface water— <b>relevant and appropriate.</b> ” Please include. Also, please delete the phrase “if water is released on a non-continuous batch basis rather than continuously” after “ <b>applicable.</b> ” It is not necessary as the text already describes it as non-continuous discharge.                                                                                                                                                                                                                                                                                                               | Agree. The prerequisite text was revised.                  |
| A        | 176         | Appendix A, ARARs, Table A-2, p. A-52 | In the row of citations regarding bypass (TDEC 0400-40-05-.07(2)(l) and (m)), in the “Prerequisite” column please add the following text, since these requirements should be noted as relevant and appropriate to radionuclides in the waste stream: “Bypass, as defined in TDEC 0400-40-05-.02(15), of waste stream— <b>relevant and appropriate</b> to radionuclides.”                                                                                                                                                                                                                                                                                                                                                                                           | Agree. The prerequisite text was revised.                  |
| A        | 177         | Appendix A, ARARs, Table A-2, p. A-52 | The following citation was included in the D2 FFS. When DOE prepared the D3 FFS, it omitted the citation to TDEC 0400-40-05-.09(1)(b). This should be restored to the FFS. It does not need to be included as shown below, grouped with the other TN CWA requirements. It must, however, be included because there are no effluent guidelines for discharge into surface water of pollutants contained in Superfund wastewater; and the applicable requirement below directs how to develop technology-based effluent limits in this situation. The last sentence in the text box below is the appropriate text to include in the “Requirement” column, and the “Action” and “Prerequisite” columns can use the text box language below.                           | Agree. This ARAR was included in the ARAR table.           |

| Location                         | Requirement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Prerequisite                                                                                                                                 | Citation                                                                         |
|                                  | <p>Project site must be ecologically suitable for providing the desired aquatic resource functions. In determining the ecological suitability of the compensatory mitigation project site, the district engineer must consider, to the extent practicable, the factors in subsections (i) thru (vi).</p> <p>Applicants should propose compensation sites adjacent to existing aquatic resources or where aquatic resources previously existed.</p>                                                                          |                                                                                                                                              | <p>40 C.F.R. § 230.93 (d)(1) and (3)</p> <p><i>Site selection</i></p>            |
|                                  | <p>In general, in-kind mitigation is preferable to out-of-kind mitigation because it is most likely to compensate for the functions and services lost at the impact site.</p> <p>Except as provided in paragraph (e)(2) of this section, the required compensatory mitigation shall be of a similar type to the affected aquatic resource.</p>                                                                                                                                                                              |                                                                                                                                              | <p>40 C.F.R. § 230.93 (e)(1)</p> <p><i>Mitigation type</i></p>                   |
|                                  | <p>The amount of required compensatory mitigation must be, to the extent practicable, sufficient to replace lost aquatic resource functions. Where appropriate functional or condition assessment methods or other suitable metrics are available, these methods should be used where practicable to determine how much compensatory mitigation is required. If a functional or condition assessment or other suitable metric is not used, a minimum one-to-one acreage or linear foot compensation ratio must be used.</p> |                                                                                                                                              | <p>40 C.F.R. § 230.93 (f)(1)</p> <p><i>Amount of compensatory mitigation</i></p> |
|                                  | <p>Implementation of the compensatory mitigation project shall be, to the maximum extent practicable, in advance of or concurrent with the activity causing the authorized impacts. The district engineer shall require, to the extent appropriate and practicable, additional compensatory mitigation to offset temporal losses of aquatic functions that will result from the permitted activity.</p>                                                                                                                     |                                                                                                                                              | <p>40 C.F.R. § 230.93 (m)</p> <p><i>Timing</i></p>                               |
| Compensatory Mitigation Planning | <p>Prepare a mitigation plan addressing objectives, site selection, site protection, baseline information, determination of credits, mitigation work plan, maintenance plan, performance standards, monitoring requirements, long-term management, and adaptive management.</p>                                                                                                                                                                                                                                             | <p>Alteration of wetlands requiring compensatory mitigation to replace lost aquatic resource functions – <b>Relevant and Appropriate</b></p> | <p>40 C.F.R. § 230.94(c)</p> <p><i>Mitigation Plan</i></p>                       |
