GUIDANCE FOR UNDERSTANDING AND INTERPRETING THE 303(d) LIST

June, 1998 (Revised July and September, 1998)

What Is the 303(d) List and Why Is It Important?

The 303(d) List is a compilation of the streams and lakes in Tennessee that are "water quality limited" or are expected to exceed water quality standards in the next two years and need additional pollution controls. Water quality limited streams are those that have one or more properties that violate water quality standards. Therefore, the stream or lake is considered to be impacted by pollution and not fully meeting its designated uses.

Additionally, the 303(d) List prioritizes each of these water quality limited streams in regard to how quickly a specialized study called a Total Maximum Daily Load (TMDL) should be performed on each.

Once a stream has been placed on the 303(d) List, it is considered a priority for water quality improvement efforts. These efforts include traditional regulatory approaches such as permit issuance, but also includes efforts to control pollution sources that have historically been exempted from regulations, such as certain agricultural and forestry activities.

If a stream is on the 303(d) List, the Division cannot use its regulatory authority to allow additional sources of the same pollutant(s). In extreme cases, it may mean that dischargers will not be allowed to expand or locate on 303(d) Listed streams until the sources of pollution have been controlled.

What Tennessee Streams Are Not On the 303(d) List?

Streams considered unpolluted, plus streams that the Division cannot assess due to a lack of water quality information, are not found on the List. Additionally, streams where a control strategy is already in the process of being implemented, are not appropriate for listing. Thus, any stream not on the 303(d) List can be assumed to either be unassessed, unpolluted, or with a control strategy already in place.

In previous 303(d) cycles, EPA advised states to not list streams if a TMDL would be of little practical benefit, such as when pollution has been caused by historical rather than by current activities. A good example would be lakes with a fishing advisory due to sediment contaminated with legacy chemicals from past discharges. EPA has reversed this position and now advises that these streams must be included on the 303(d) List and prioritized for future TMDL generation. Thus, the 1998 303(d) List will contain some additional sites not found on the 1996 version.

How Were the Waters Assessed for this Document?

The assessment of Tennessee's waters was based on a water quality evaluation that took place during the winter of 1997-1998. Using readily available water quality data, the Division of Water Pollution Control placed each of the nearly 850 waterbodies of Tennessee into one of the following categories:

- **Fully Supporting Designated Uses.** The quality of water is good enough to support the uses assigned to it by the Tennessee Water Quality Control Board. Most streams in Tennessee fall into this category.
- **Fully Supporting, but Threatened.** The stream is considered unimpacted by pollution, but the Division believes that a continuation of land use or other trends will cause the stream to fail to support designated uses **within the next two years**.

- **Partially Supporting.** The body of water is somewhat impacted by pollution and water quality criteria are exceeded on some frequency. Water quality is considered **moderately impacted**.
- **Not Supporting.** The body of water is highly impacted by pollution and water quality criteria are exceeded on a regular or frequent basis. Water quality is considered **severely impacted**.

As mentioned previously, the 303(d) List is composed of streams considered **Partially Supporting** or **Not Supporting**. Threatened streams are also appropriate for listing.

What Types of Data Were Used in the Assessment of Tennessee Streams?

The Division utilized its own water quality data, plus that collected by other agencies and entities in Tennessee. It is important to note that the Division did not have any data that it chose not to consider during the assessment process. The data generally fell into the following categories:

CHEMICAL DATA	BIOLOGICAL DATA	PHYSICAL DATA	SEDIMENT AND FISH TISSUE DATA
Compliance monitoring performed at the nearly 2,000 permitted dischargers in Tennessee. Also, includes data collected as a result of complaint investigations, fish kills, spills, and in support of enforcement activities.	Rapid bioassessment surveys completed in support of the watershed approach. These were performed primarily in tributary streams as a means of monitoring biological integrity.	Temperature and flow data collected at various sites in Tennessee.	Division sediment and fish tissue data collected at various sites across Tennessee.
Ambient data collected at the Division's fixed-station monitoring network. Contains over 100 sites. Also, stations established to support the Watershed approach.	Division ecoregion biological monitoring. Benthic and fish IBI score calculated at many sites.	Quantitative assessments of habitat made in conjunction with biological surveys.	EPA's report <i>The Incidence and Severity of Sediment Contamination in Surface Waters of the United States</i> .
Chemical data collected at the Division's 100 ecoregion reference sites. (These stations provide a baseline to which other sites within that ecoregion can be compared.)	Bioassay studies of effluent toxicity at most major NPDES dischargers. Many minor facilities also do this type testing.	Time-of-travel studies of flow, oxygen sags and BOD decay rates.	Locations of existing fishing advisories in Tennessee.
Chemical data collected by other agencies*.	Biological data collected by other agencies*.	Physical data collected by other agencies*.	Data collected by other agencies*.

* The Division of Water Pollution Control is grateful to the following agencies for the use of their monitoring data and reports: **U.S. Environmental Protection Agency** (STORET, sediment report, *Index of Watershed Integrity*); **Tennessee Valley Authority** (River Action Teams biological data, Reservoir Vital Signs Monitoring, NPDES discharge monitoring, recreational area fecal coliform sampling, tailwater monitoring); **Tennessee Wildlife Resources Agency** (biological surveys and fish tissue monitoring data); **U.S. Geological Survey** (gaging station data); **U.S. Army Corps of Engineers** (water, sediment, and tailwater monitoring), and **U.S. Fish and Wildlife Service** (species databases).

Public Participation

The Division of Water Pollution Control held public hearings in Knoxville (May 7) and in Nashville (May 8) to specifically discuss the draft 303(d) List. These meetings were well attended and staff explained the development and legal ramifications of the list to an interested group of citizens, other agencies, and the regulated community.

Many people found and downloaded the 303(d) List from the Department's Home Page. Additionally, the statewide water quality assessment and the 303(d) List were discussed at the Watershed Management public hearings held during the spring of 1998. At these presentations, watershed-specific results were discussed and citizens, agencies, and university staff were asked to provide any additional water quality information that they might have. Following is a list of these meetings.

WATERSHED MEETING SCHEDULE

WATERSHED	DATE	LOCATION	ATTENDANCE
EAC, Chattanooga			
Ocoee	May 5	Ducktown	22 people
TN River-1	May 6	Watts Bar	6 people
EAC, Jackson			
SFFD	May 26	Jackson	4 people
EAC, Johnson City			
Watauga	May 19	Sycamore Shoals	16 people
EAC, Knoxville			
Emory	May 27	Cumberland Mtn State Park	22 people
Watts Bar	May 28	Harriman	6 people
EAC, Memphis			
Nonconnah	June 2	Memphis	9 people
EAC, Nashville			
Harpeth	May 20	Franklin	40 people
Stones	May 21	Murfreesboro	10 people

Following the end of the public participation phase, the Division prepared a formal response to all comments received concerning the 1998 303(d) List.

What Is a TMDL?

A Total Maximum Daily Load (TMDL) is a study that (1) quantifies the amount of a pollutant in a stream, (2) identifies the sources of the pollutant, (3) and recommends regulatory or other actions that may need to be taken in order for the stream to no longer be polluted. Following are actions that might be recommended:

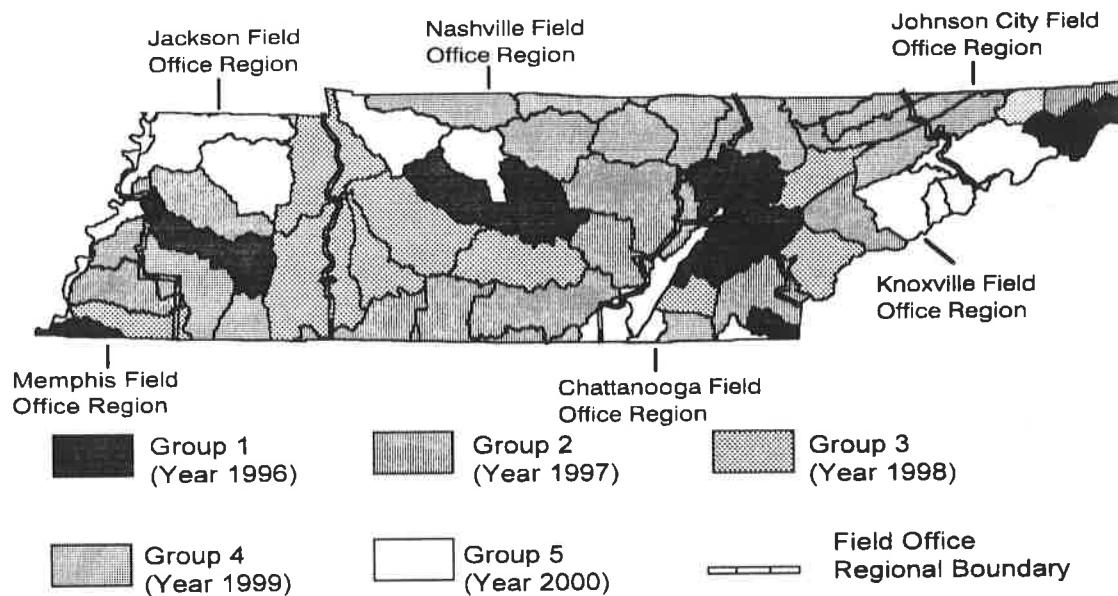

- Re-allocate limits on the sources of pollutants documented as impacting streams. It might be necessary to lower the amount of pollutants being discharged under NPDES permits or to require the installation of other control measures, if necessary, to insure that standards will be met.
- For sources the Division does not have regulatory authority over, such as ordinary agricultural and forestry activities, provide information and technical assistance to other state and federal agencies that work directly with these groups to install appropriate Best Management Practices.

Even for the impacted streams found on the 303(d) List, TMDL development is **not** considered appropriate for all bodies of water. If enforcement has already been taken and a compliance schedule has been developed; or if best management practices have already been installed for non-regulated activities, the TMDL is considered **not applicable**. In cases involving pollution sources in other states, the recommendation may be that another state or EPA perform the TMDL.

How Are the TMDLs Prioritized?

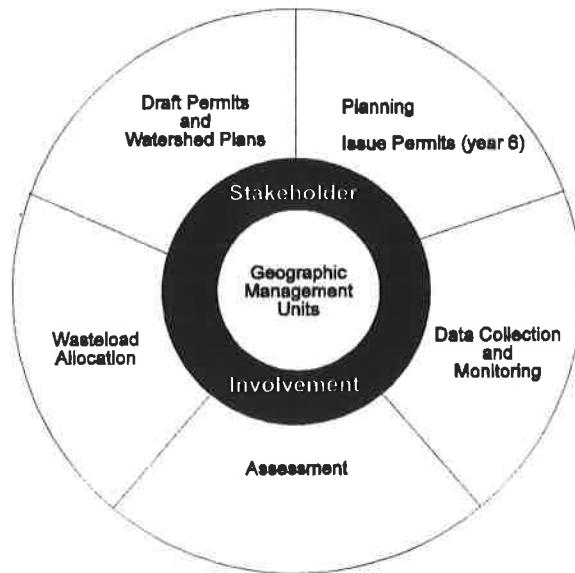

The 303(d) List was last updated in 1996. In the interim, the Division of Water Pollution Control has restructured monitoring and permitting activities on a rotating watershed basis. In keeping with this approach, Tennessee has decided to develop TMDLs on a rotating watershed basis. Each watershed will be examined on a five-year cycle as illustrated on the map.

Tennessee's Watershed Management Groups

A typical cycle will generally include:

- | | |
|--|---|
| <p>Year 1 Hold planning meetings with "stakeholders". Stakeholders include citizens, environmental groups, other governmental agencies, municipalities, industries, and other interested parties. Develop a monitoring plan.</p> <p>Year 2 Collect water quality data.</p> <p>Year 3 Collect water quality data.</p> <p>Year 4 Water quality assessment activities. Perform modeling and TMDL generation.</p> <p>Year 5 Publish a watershed plan, which includes the proposed actions to be taken to insure that water quality standards will be met. Issue draft NPDES permits and hold public hearings.</p> | <p>Year 6 Issue final permits after comments have been addressed. Begin cycle again in sixth year.</p> |
|--|---|

EPA has asked the Division to create a schedule to develop all of the needed TMDLs for 303(d) listed streams by the year 2011. For its part, EPA has committed to provide better guidance and new tools for TMDL generation.

Thus, for the next two years, the Division has decided to base its TMDL priority for each body of water on the 303(d) List based on the following philosophy:

High Priority	The body of water is in a watershed identified to begin its five-year cycle in 1996, 1997, or 1998 and the pollutant causing the impact is one for which EPA has provided tools for TMDL generation, such as low dissolved oxygen, metals or fecal coliforms. Our assessment of priority considers the severity of pollution in the waterbody and the uses to be made of the waters.
Low Priority	The body of water is considered polluted (not supporting or partially supporting) and the pollutant causing the impact is one for which EPA has not provided guidance for TMDL generation, such as sediment contamination, nutrients, wet-weather flows, air deposition, and other legacy problems.
Not Applicable	The stream is impacted, but a TMDL is not appropriate for this body of water for the reasons described in the section <i>What Is a TMDL?</i>

Key to 303(d) List

WATERBODY ID	In 1988, the Division divided the state's waters into "waterbodies" and created a database of information about each. Each waterbody has an ID based on EPA's River Reach System. The first eight digits of the ID after TN is the USGS HUC Code number. We are making substantial progress toward converting this system into a GIS-based system. The 303(d) List is sorted in hydrologic order within each major watershed basin.
WATERBODY NAME	The name of the main body of water within the waterbody is provided as well as a short description of the impacted segments.
COUNTY	The county the waterbody is in. Where waterbodies stretch across multiple counties, the more downstream county is usually listed.
PARTIAL	If the stream is considered partially supporting designated uses, the number of impacted miles (according to Reachfile 3) are shown in this column. Lake acres are listed as "ac".
NOT	If the stream is considered not supporting designated uses, the number of impacted miles (according to Reachfile 3) are shown in this column. Lake acres are listed as "ac".
CAUSE	The pollutant or pollutants exceeding water quality standards is identified.
SOURCE	The general source of each pollutant exceeding water quality standards within the waterbody is identified. (For both causes and sources, the Division uses categories provided by EPA so that we might be consistent with language used by other states.)
MAG	The magnitude of the cause or source is given as High, Medium, or Slight .
TMDL	TMDL Priority is either High, Low, or Not Applicable .
COMMENTS	For some impacted waters, additional information is provided.

FINAL
1998 303(d) LIST FOR THE STATE OF TENNESSEE

Upper Cumberland Basin

This basin contains the following USGS Hydrologic Unit Codes: 05130101 (Clear Creek), 05130104 (South Fork Cumberland River), 05130105 (Obey River), 05130106 (Cordell Hull Lake), 05130107 (Collins River), and 05130108 (Caney Fork River).
