To see if an infusion is right for you, contact your medical provider.

If you test positive for COVID-19 and meet the following criteria, you may be eligible to receive a monoclonal antibodies infusion:

- Your COVID-19 test comes back positive
- You are not hospitalized
- You are less than 10 days since onset of mild to moderate symptoms
- You have high-risk factors that include:
  - >65 years old
  - Obesity with Body Mass Index >35 (adults)
  - Diabetes
  - Chronic kidney disease
  - Immunosuppressive disease, or on immunosuppressive therapy
  - >55 years old AND have
    - Cardiovascular disease, OR
    - Hypertension, OR
    - Chronic obstructive pulmonary disease / other chronic respiratory disease

What are monoclonal antibodies?

- Monoclonal antibodies are laboratory-made proteins that mimic the immune system's ability to fight off harmful viruses and bacteria that can cause disease
- Bamlanivimab (Lilly) and casirivimab/imdevimab (Regeneron) are monoclonal antibodies that the U.S. Food and Drug Administration (FDA) has issued an emergency use authorization for the treatment of mild-to-moderate COVID-19 in non-hospitalized adult and pediatric patients

Why would I consider receiving a monoclonal antibodies infusion?

- An infusion may minimize the potential for higher risk patients to progress to severe disease and/or hospitalization

If you believe that you would be an appropriate candidate for these therapies, then please contact your medical provider to see if an infusion is right for you.

If you do not have a medical provider, you can go online to the link below to find the nearest place that may be able to discuss this option and may treat you.

Monoclonal antibodies should not be considered the standard of care for the treatment of all patients with COVID-19.
