TENNESSEE PERINATAL CARE SYSTEM
GUIDELINES FOR REGIONALIZATION, HOSPITAL CARE LEVELS,
STAFFING AND FACILITIES

PREFACE

The first edition of these Guidelines appeared in 1978; further editions were published in 1984, 1990, 1997, 2004, and 2010. This seventh edition was prepared by a workgroup representing a broad spectrum of health care professionals drawn from throughout the state. It was subsequently adopted by the Perinatal Advisory Committee. As was the case with the six preceding editions, the ultimate goal of these Guidelines is to improve perinatal outcomes in Tennessee by providing quality care to every mother and newborn. The Guidelines describe components of various care levels with the full realization that many of these components are already in place while others are goals which are actively pursued. The document emphasizes the importance of communication and collaboration among all health care professionals who provide perinatal services in Tennessee. It is also important to remember that, because our state’s population has grown to include people from all over the world, the services provided to mothers and newborns must be culturally, as well as medically, appropriate.

As described in Tennessee Code Annotated 68-1-802,

(a) The department [of Health] is directed to develop a plan to establish a program for the diagnosis and treatment of certain life-threatening conditions present in the perinatal period.

(b) The program shall assist pregnant women and their fetuses and newborn infants by developing a regionalized system of care, including highly specialized personnel, equipment and techniques that will decrease the existing high mortality rate and the life-long disabilities that currently prevail in surviving newborn infants.

Regionalization of perinatal health care in the State of Tennessee was motivated by an overwhelming need to ease access to contemporary care by as large a segment of the population as was feasible. Since publication of the first edition, the number of providers of perinatal health care has increased remarkably. There has also been an increase in the level of expertise in most institutions in the state. However, many Tennessee counties have hospitals without perinatal services. We must continue to provide professional advice and supervision on perinatal health care to health care providers, thereby making quality care available to every woman and child in Tennessee regardless of community size and geographic location.

In order to assure contemporary pertinence of these and subsequent Guidelines, the Perinatal Advisory Committee has limited its approval to a period no longer than five years from the date of approval by the Commissioner of the Department of Health. A revision of this document will be mandatory at that time, unless one becomes necessary at an earlier date.
INTRODUCTION

Professional advice and supervision of health care must be available to every pregnant woman and her newborn child in Tennessee. The vast majority of the newly born are healthy, but intact survival is jeopardized in a substantial number who require complex medical attention. These severe illnesses often can be anticipated and then ameliorated or eliminated by special management of high-risk mothers. In the extreme, this type of medical attention entails recruitment of a variety of specialized professional personnel who are generally more concentrated in densely populated communities. It is in these larger communities that the fullest spectrum of medical consultants, nurse specialists, laboratory capabilities and equipment are usually situated, but complex medical management must be accessible to all patients regardless of community size and geographic location. That perinatal mortality and morbidity can be substantially reduced by contemporary technology has been plainly documented for decades. From this fact alone, there remains a sense of urgency to make such technology available to all mothers and infants in Tennessee, to eliminate existing inaccessibility to complex care, and to assure a high quality of medical attention in every hospital that renders it, complexity of care and location of hospital notwithstanding.

The overall goal is effective care for the State as a whole. Available resources must be appropriately utilized. Access to care (Levels I, II, III, and IV) should be available within all perinatal regions, and each level of care, no matter how complicated, should be of optimal quality. The sole determinant of where care will be administered, and by what types of personnel, should be the severity of illness. The decision regarding the location of care should be made jointly by the obstetric and pediatric care providers caring for the mother and fetus/newborn.

When providing care and considering selection of a delivery site for the maternal fetal dyad, the perinatal provider(s) should evaluate both components separately. The delivery location selected should provide the highest level of care for the component with the highest acuity need. This decision must be made independent of gestational age, fetal weight, and maternal condition. For example, a woman with acute fatty liver of pregnancy at term requires Level IV maternal care because of this life-threatening condition. Conversely, a woman who experiences preterm premature rupture of membranes at 24 weeks of gestation but has no maternal issues should be transferred to a facility capable of providing appropriate neonatal care for this situation.

Although services should be available as close to home as possible, transfer of patients from one hospital to another is inevitable if all levels of care are to be provided. An effective system requires designation of hospitals for provision of care according to their capacity. These Guidelines have been written for that specific purpose. Beyond care levels, consultation and transport of patients should provide functional continuity between hospitals. Fundamental to all these activities is the continuing education of personnel within perinatal regions; without it the effectiveness of care will deteriorate.
Although these Guidelines are addressed to institutions that provide perinatal services, the basic emphasis is on the role of physicians, nurses and other health care personnel who directly and personally provide patient care. Institutions herein described differ from each other in the variety of services performed by their personnel. The institutional components of the Tennessee Perinatal Care System include birth centers and four hospital categories that indicate their capacities to provide complex care for mothers and newborns: Levels I, II, III, and IV. In regard to obstetric care, Levels I, II, III, and IV are adopted from the ACOG / SMFM consensus statement on levels of maternal care, published in 2014. In terms of neonatal care, we have adopted the hospital designations (Levels I, II, III, and IV) recommended by the American Academy of Pediatrics Committee on Fetus and Newborn in its policy statement on Levels of Neonatal Care, which was published in 2012. Adoption of these designations brings Tennessee into compliance with national guidelines. Regional Perinatal Centers are Level III or Level IV institutions that have been designated by the State to coordinate certain regional activities that relate to professional education, patient transport and inter-hospital functions, as well as care of patients. The general characteristics of each care level are summarized in the paragraphs that follow. Details of these characteristics are set forth in the corresponding service level sections of these Guidelines.
REGIONAL PERINATAL CENTERS

I. REGIONS DEFINED

There are five perinatal regions in Tennessee: Northeast, East, Southeast, Middle, and West. Each region is comprised of a group of contiguous counties. The perinatal regions and the counties comprising them are listed on page 69. Each region contains one Regional Perinatal Center, which has been so designated by the Commissioner of the Tennessee Department of Health.

II. REGIONAL PERINATAL CENTERS LISTED

Each of Tennessee’s five Regional Perinatal Centers is capable of providing Level III or Level IV obstetric and neonatal care. The Regional Perinatal Centers are:

Northeast Tennessee Regional Perinatal Center
Johnson City Medical Center Hospital
Johnson City, Tennessee
Perinatal Center office: (423) 431-6640
L&D: (423) 431-6436
Referrals: 1-800-365-5262
Neonatal Consult/Transport: (423) 952-3720
General Hospital Operator: (423) 431-6111

East Tennessee Regional Perinatal Center
The University of Tennessee Medical Center at Knoxville
Knoxville, Tennessee
L&D: (865) 305-9830
Maternal Referrals: 1-800-422-9301 or 865-305-9300
Neonatal Consult/Transport: 1-800-732-7295 or (865) 305-9834
NICU: (865) 305-9834
General Hospital Operator: (865) 305-9000

Southeast Tennessee Regional Perinatal Center
Erlanger Health System/Children’s Hospital at Erlanger
Chattanooga, Tennessee
L&D: (423) 778-7956
OB Consults / Referrals: (423) 778-8100 or 1-866-4HI-RISK
Neonatal Consult/Transport: (423) 778-6438
NICU: (423) 778-6438
General Hospital Operator (Erlanger): (423) 778-7000
General Hospital Operator (Children’s Hospital): (423) 778-6011

Middle Tennessee Regional Perinatal Center
Vanderbilt University Medical Center/Monroe Carell, Jr. Children’s Hospital at Vanderbilt
Nashville, Tennessee
L&D: (615) 322-2555
OB Consults/Referrals: 1-888-636-8863 (1-888-MFM-VUMC)

The Regional Perinatal Centers section was moved from the back of the document to the front for more prominent placement. A motion was properly made and seconded to approve this change at the Perinatal Advisory Committee meeting on July 11, 2019. The motion passed unanimously.
Neonatal Consult / Transport: 1-855-322-9111
NICU: (615) 322-0963
General Hospital Operator (Vanderbilt): (615) 322-5000
General Hospital Operator (Children’s Hospital): (615) 936-1000

West Tennessee Regional Perinatal Center
Regional Medical Center at Regional One Health
Memphis, Tennessee
L&D: (901) 545-7345
OB Inpatient Transport: (901) 545-8181
Neonatal Consult/Transport: (901) 545-7366
NICU: (901) 545-7366
General Hospital Operator: (901) 545-7100
III. SERVICES PROVIDED

Tennessee's Regional Perinatal Centers must provide the following services:

A. Consultation and Referral

1. If no other appropriate facility is available to manage significant high-risk conditions, the Regional Perinatal Center must accept all such patients regardless of financial status.

2. Telephone consultation by obstetric and newborn sub-specialists must be available to physicians and nurses within the region 24 hours daily.

B. Professional Education

1. For the Staff of the Regional Perinatal Center: A program of professional education must be maintained for the staff of the Regional Perinatal Center. These programs should satisfy the educational requirements for physicians, nurses, social workers, and others who function in the administration of Level III or Level IV care.

2. For the Staff of Other Hospitals in the Region: The Regional Perinatal Center must maintain a program of professional outreach education for hospitals within its region. These programs of instruction require a staff of qualified educators to present ongoing courses to Level I, II, and III hospitals. These courses must satisfy the educational objectives set forth in the series of publications for the education of nurses and social workers published by the Tennessee Department of Health.

C. Maternal-Fetal and Neonatal Transport

The Regional Perinatal Center is responsible for maternal-fetal and neonatal transport described for Level III or Level IV facilities elsewhere in these Guidelines. Whereas the provision of these transport services is an option for Level III or Level IV units that do not function as Regional Perinatal Centers, transport services are required of a Regional Perinatal Center. Transport for the purpose of admission to the Regional Center must be made available to all patients within the state regardless of their financial status, and to patients referred from other Regional Perinatal Centers. Protocols for transport should conform to the most recent edition of the *Tennessee Perinatal Care System Guidelines on Transportation*, published by the Tennessee Department of Health.

D. Site Visits

The Regional Perinatal Center staff will engage in site visits upon request within its region.

E. Post-discharge Maternal Follow-up

Follow-up evaluation of selected women who are discharged from the Regional Perinatal Center should be arranged.
F. Post-discharge Neonatal Follow-up

Follow-up evaluation of selected infants who are discharged from the Regional Perinatal Center should be performed. Neonatal intensive care unit graduates who are considered high risk and those with birthweights <1500 grams should be enrolled in an organized follow-up program that tracks and records medical and neurodevelopmental outcomes to allow later analysis.

G. Data Collection

The Regional Perinatal Center must compile data (Program Objectives Report [POR]) on regional patients for analysis and evaluation, including outcomes and complications for quality improvement according to requirements prescribed by the Tennessee Perinatal Care System. These data will be forwarded to a central facility on a regular basis. All Regional Perinatal Centers should participate in a state or national continuous quality improvement initiative that includes ongoing data collection and review for benchmarking and evaluation of outcomes. Examples of continuous quality improvement initiatives available in Tennessee are those provided by TIPQC and THA.

SUMMARY OF PERINATAL SERVICE LEVELS

REGIONAL PERINATAL CENTERS

The perinatal regionalization program was established to provide for the diagnosis and treatment of certain life-threatening conditions of pregnant women and newborn infants. The five regional perinatal centers across the state have made this specialized care available by providing a statewide mechanism to health care providers for consultation and referral of high risk patients; transport of these patients, if necessary; personnel skilled in high risk perinatal care; post-graduate education for physicians, nurses, and other medical personnel; and site visits to local hospitals. These Centers perform outreach education for facilities and health care providers in the region and analysis and evaluation of regional data, including perinatal complications and outcomes for quality improvement.

The regionalization system in Tennessee has been in place since the early 1970s and serves our state by providing the necessary statewide infrastructure for high risk perinatal care. Established as a result of State statute, the regionalization system is addressing the needs of the State’s pregnant women and infants. The regionalization system is a key component in the State’s capacity to improve birth outcomes, especially infant mortality.

BIRTH CENTERS

These facilities are licensed to provide peripartum care for uncomplicated pregnant women in vertex presentation at term, anticipating an uncomplicated singleton birth. These facilities must have the capability and equipment to provide low-risk maternal care and anticipate any potential emergency situation. There must exist an established agreement with a receiving hospital with which hospital policies and procedures confirm the ready availability of properly prepared transport systems. The facility must have a thorough data collection, storage and retrieval system and the capability to initiate quality improvement programs that include efforts to maximize patient safety. Medical consultation must be available at all times and at least two qualified professional attendants must be present at each delivery. Primary maternal care providers must be legally recognized to practice in the Birth Center facility and within the jurisdiction of the Center. CNMs, CMs, CPMs, licensed midwives, family physicians and OB-GYNs may be legally recognized to be a qualified professional attendant. The facility must have available an adequate number of qualified professionals with competence in Basic (Level 1) care criteria and ability to stabilize and transfer high-risk women and newborns.

LEVEL I UNITS

Level 1 units must provide care of uncomplicated pregnancies with the ability to detect, stabilize and initiate management of unanticipated maternal-fetal or neonatal complications that occur during the antepartum, intrapartum or postpartum period until the patient can be transferred to a facility at which specialized maternal care is available. The facility must have all of the capabilities already delineated for the Birth Center plus readily available within the institution: obstetrical ultrasonography, laboratory testing and blood bank supplies; and the ability to perform an emergency Cesarean delivery in the appropriate time for the greatest maternal and fetal benefits. Protocols and capabilities must exist for transfusion. A formal transfer plan must be established with an institution of high level obstetrical and neonatal care. The institution must have the ability to initiate education and quality improvement programs to maximize patient
safety and to collaborate with the higher level obstetrical and neonatal care with which a formal transfer plan exists.

Level I units also provide a basic level of care for neonatal patients who are low risk. They have the capability to perform neonatal resuscitation at every delivery and to evaluate and provide routine postnatal care for healthy newborn infants. In addition, they can care for preterm infants at 35 to 37 weeks’ gestation who are physiologically stable and can stabilize newborn infants who are less than 35 weeks of gestation or who are ill until they can be transferred to a facility where the appropriate level of neonatal care is provided (American Academy of Pediatrics and American College of Obstetricians and Gynecologists Guidelines for Perinatal Care, 7th edition, 2012).

Late preterm infants (34-36 weeks’ gestation) are at risk for increased neonatal morbidity and mortality.

LEVEL II UNITS – OBSTETRIC

Level II obstetric units have the capability to provide a broad range of maternal-fetal services for normal patients and for those with mild or moderate obstetric illnesses or complications. These units provide planned delivery services for women whose infants are expected to be >32 completed weeks of gestation and have a birthweight of at least 1500 grams. Additionally, a need for immediate pediatric subspecialty care for these newborns should not be anticipated. Level II obstetric units also provide emergency care for unplanned births of younger, smaller, or sicker babies before transfer to a facility at which newborn intensive care is provided.

A Level II unit must have more capabilities than the Level I unit including: computed tomography scan and ideally magnetic resonance imaging. Nursing leadership and staff should have formal training and experience in the provision of perinatal nursing care and should coordinate with respective neonatal care services with interpretation available. There should be sufficient RN staff with competence in level II care and the ability to stabilize and transfer high-risk women and newborns requiring higher levels of care. The director of the obstetric service should be a board-certified OB-GYN actively practicing obstetrics. There should be an established relationship with an MFM available for consultation by reasonable means (i.e., on site, by phone or by telemedicine). There should be anesthesia services at all times to provide labor analgesia and surgical anesthesia, with a board-certified anesthesiologist with special training or experience in obstetric anesthesia available for consultation. There should be medical and surgical consultants available to stabilize the obstetrical patient who has been admitted to the facility or is prepared for transfer to another facility.

LEVEL II UNITS – NEONATAL

Level II nurseries provide specialty neonatal services. They provide care for stable or moderately ill infants born at ≥32 weeks gestation and weighing ≥1500 grams who have problems that are expected to resolve rapidly and are not anticipated to need subspecialty services on an urgent basis. These units also resuscitate and stabilize preterm and/or ill infants before transfer to a facility at which newborn intensive care is provided. Level II nurseries provide mechanical ventilation for brief (<24 hrs) duration and continuous positive airway pressure, until the infant’s condition improves or the infant can be transferred to a higher-level facility (American Academy of Pediatrics and American College of Obstetricians and
In addition, Level II units provide care for infants who are convalescing after intensive care.

**LEVEL III UNITS – OBSTETRIC**

Level III obstetric units have the capability to provide a broad range of maternal-fetal services for normal patients as well as for those requiring intensive care services. These units provide planned delivery services for women with infants of all gestational ages. These units should be committed to assist Level I and Level II centers with quality improvement and safety programs and provide perinatal system leadership as necessary. Advanced imaging services should be available at all times, and medical and surgical ICUs should accept pregnant women with onsite critical care providers to actively collaborate with MFM at all time. Appropriate equipment and personnel should be available onsite to ventilate and monitor women in labor and delivery until they can be safely transferred to the ICU. As in level I and II centers, availability of adequate numbers of nursing leadership and RNs with competence in Level III care should be maintained and capable as well for stabilization and transfer of women with complex maternal illnesses and obstetric complications. The Director of the Obstetric Service should be a Board-certified OB-GYN actively practicing obstetrics and the Director of MFM should be a Board-certified MFM with active inpatient privileges who is available at all times, either onsite, by phone or telemedicine. There should be anesthesia services at all times onsite, with a board-certified anesthesiologist with special training or experience in obstetric anesthesia in charge of the institution’s obstetric anesthesia service. There should be a full complement of subspecialists available for inpatient consultation.

**LEVEL III UNITS – NEONATAL**

Level III nurseries provide care for infants who are born at <32 weeks of gestation or weigh <1500 grams at birth or have complex medical or surgical conditions, regardless of gestational age. Level III units have continuously available personnel and equipment to provide life support for as long as needed. They can provide ongoing assisted ventilation for periods longer than 24 hours, which may include conventional ventilation, high-frequency ventilation, and inhaled nitric oxide. A broad range of pediatric medical subspecialists and pediatric surgical specialists should be readily accessible on site or by prearranged consultative agreements (American Academy of Pediatrics and American College of Obstetricians and Gynecologists *Guidelines for Perinatal Care*, 7th edition, 2012).

**LEVEL IV UNITS – OBSTETRICAL**

Level IV units provide care on site for the most complex maternal conditions of the critically ill pregnant woman and her fetus/es throughout the antepartum, intrapartum and postpartum care needed. The capabilities of the Level III center are supplemented by on site ICU care for the obstetrical patient long term in addition to critical care beds. In addition to the established criteria for the Level III Centers, the Level IV Center will have adequate nursing leadership and RNs with the appropriate experience at all times; there will be an MFM team with full privileges available at all times, to be on site for consultation and management as well as to co-manage ICU admitted obstetric patients. These centers will also have a massive transfusion protocol in place. The MFM team is to be led by an active Board-certified MFM with experience in critical care obstetrics. The Director of the obstetric service shall be a board certified MFM, or Board-

---

5 The wording of the fourth sentence in the *Level II Units – Neonatal* section was revised to provide clarity. A motion was properly made and seconded to approve this change at the Perinatal Advisory Committee meeting on July 11, 2019. The motion passed unanimously.
certified OB-GYN with experience in Critical Care Medicine. There must be anesthesia services onsite at all times, with a board-certified anesthesiologist with special training or experience in obstetric anesthesia in charge of the institution’s obstetric anesthesia service. There should be a full complement of subspecialists available for inpatient consultation and to collaborate with the MFM team.

**LEVEL IV UNITS – NEONATAL**

Level IV units include the capabilities of Level III units with additional capabilities and considerable experience in the care of the most complex and critically ill newborn infants. Pediatric medical and pediatric surgical specialty consultants must be continuously available 24 hours per day. Level IV facilities also must have the capability for surgical repair of complex conditions (e.g., congenital cardiac malformations that require cardiopulmonary bypass with or without extracorporeal membrane oxygenation) (American Academy of Pediatrics and American College of Obstetricians and Gynecologists *Guidelines for Perinatal Care, 7th edition, 2012*).
BIRTH CENTER FACILITIES

I. SERVICES PROVIDED

Birth centers provide peripartum care of low-risk women with uncomplicated singleton term pregnancies with a vertex presentation who are expected to have an uncomplicated birth.

These facilities must have the capability and equipment to provide low-risk maternal care and a readiness at all times to initiate emergency procedures to meet unexpected needs of the woman and newborn within the center, and to facilitate transport to an acute care setting when necessary.

A. Educational Services

Educational services should include the following:

1. Parent Education: Ongoing perinatal education programs for parents.

2. Nurses' Education: Programs for nurses should conform to the most recent edition of *Tennessee Perinatal Care System Educational Objectives for Nurses, Level I*, published by the Tennessee Department of Health. These courses may be made available periodically at the birth center by instructors from a Regional Perinatal Center. The courses may also transpire at a Regional Perinatal Center, or at any other site remote from the hospital, thus requiring that the hospital provide nurses with educational leave for attendance. The birth center is responsible for the necessary arrangements for nurse education. Nurses should maintain a level of competency in fetal monitoring as determined by their institution.

3. All perinatal care providers, including anesthesia care providers, should maintain current Neonatal Resuscitation Program (NRP) provider status. All newborn care providers should also maintain current S.T.A.B.L.E. provider status.

B. Maternal-Fetal Care

1. Anticipated Low Risk Patients: Prenatal care for uncomplicated patients should meet criteria published in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

2. Maternal / Fetal Evaluation: A capability for assessment of mother and fetus should be maintained. Ultrasound technology for fetal evaluation should be available.

3. Complicated Patients: Medical consultation must be available at all times. There should be an established agreement with a receiving hospital with policies and procedures for timely transport.
C. **Neonatal Care**

A birth center should provide basic neonatal care as follows (see the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists):

1. **Newborn services have the capabilities to:**

   Provide neonatal care at every delivery according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program.

   Evaluate and provide postnatal care to stable term newborn infants. Hearing, metabolic, and CCHD screening programs should adhere to the most recent State of Tennessee regulations and the most recent edition of *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

   Stabilize newborn infants who have unexpected complications until transfer to a facility that can provide the appropriate level of neonatal care. Provide neonatal post-resuscitation care and pre-transport stabilization care per the most recent edition of the S.T.A.B.L.E. Program.

D. **Support Services**

1. Breastfeeding educational services should be available as described in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

E. **Social Services**

Social services and family support should be available, provided by utilization of public and private agencies.

F. **Maintenance of Data**

Birth centers have the capability to collect, store, and retrieve data as follows:

1. **Maternal**

   - Name, medical record number
   - Age, gravidity, parity, etc.
   - Date of first prenatal visit
   - Gestation (weeks)
   - Availability of prenatal records (including prenatal labs) on admission.
   - Prenatal lab results that should be available on admission include: hepatitis B surface antigen, HIV, serology, Group B strep, blood type
and Rh status, antibody status, rubella, gonorrhea, chlamydia, and other tests as appropriate

- Social history to include alcohol, drug, or tobacco use and/or history or suspicion of domestic violence
- Prior cesarean section
- Electronic fetal monitoring (Yes or No)
- Induction (Yes or No)
- Indications for induction
- Time of membrane rupture
- Presentation
- Type of delivery (cesarean section, type of forceps, vacuum extraction, spontaneous)
- Indication for cesarean section / operative vaginal delivery
- Time of birth
- Birthweight
- Apgar scores
- Resuscitation (Yes or No)
- Type of resuscitation
- Maternal-fetal complications
- Anesthesia (type)
- Infant status on leaving delivery room (normal, abnormal, expired)
- Physician’s name
- Nurse’s name
- Disposition
  - Discharged home
  - Transferred to a higher level of care / Receiving hospital / Transport service
  - Expired

2. **Neonatal**

- Name, gender, hospital medical record number
- Date of birth
- Birthweight
- Gestational age
- Apgar scores
- Maternal complications (test results relevant to neonatal care; maternal illness potentially affecting the fetus; history of illicit substance use or any other known socially high-risk circumstances; complications of pregnancy associated with abnormal fetal growth; fetal anomalies, or abnormal results from tests of fetal well-being; information regarding labor and delivery; and situations in which lactation may be compromised)
- Discharge diagnoses
- Special care administered (specify)
- Documentation of newborn metabolic, hearing, and critical congenital heart disease (CCHD) screens, and immunizations and medications given
• Bilirubin screen (according to American Academy of Pediatrics guidelines)
• Disposition
  - Discharged home
  - Transferred to a higher level of care / Receiving hospital / Transport service
  - Expired

G. Quality Improvement

All birth centers must have the ability to initiate quality improvement programs that include efforts to maximize patient safety.

H. Consultation and Transfer

1. Maternal-Fetal: Planned vaginal deliveries at gestational ages below 37 weeks or of multiple gestations should be referred to an appropriate higher level of care. Consultation with an obstetric provider at the higher level facility is indicated if past history, prenatal course, and/or intrapartum or postpartum events indicate that mother or fetus is at risk.

2. Neonatal: Stabilize newborn infants who have unexpected complications until transfer to a facility that can provide the appropriate level of neonatal care.

3. Protocols for maternal-fetal and neonatal transport should conform to the most recent edition of the *Tennessee Perinatal Care System Guidelines on Transportation*, published by the Tennessee Department of Health.

II. PERSONNEL: QUALIFICATIONS AND FUNCTIONS

At least two qualified professional attendants must be present at each birth.

Primary maternal care providers include CNMs, CMs, CPMs, and licensed midwives who are legally recognized to practice in the jurisdiction of the birth center; family physicians; and OB-GYNs.

The facility must have available an adequate number of qualified professionals with competence in basic (Level 1) care criteria and ability to stabilize and transfer high-risk women and newborns.

III. SPACE AND EQUIPMENT FOR INTRAPARTAL AND POSTPARTAL CARE

A. Physical Facilities and Equipment

Physical facilities and equipment should meet criteria published in the latest edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists. All rooms where babies are delivered should be kept at a
temperature of 25 degrees C. (77 degrees F.) or higher to prevent hypothermia in the newborn.

B. **Resuscitation**

Provision must be made for resuscitation of infants at delivery. The capability for resuscitation should include assisted ventilation with oxygen administered by bag and mask or bag and endotracheal tube, chest compression, and appropriate intravascular therapy. A treatment station for this purpose should be located in each delivery room with the following: suction apparatus; a pulse oximeter; a source of blended oxygen; infant resuscitation positive pressure ventilation equipment, masks and endotracheal tubes in appropriate sizes; laryngoscope and blades; appropriate drugs; and equipment for umbilical vessel catheterization. Infusion pumps must be immediately available. An optimal thermal environment for the infant should be provided by a radiant warmer that is immediately available.

**IV. SPACE AND EQUIPMENT FOR THE NORMAL INFANT**

A. Physical facilities and equipment should meet criteria published in the latest edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

B. Minimal equipment for the newborn:

1. A platform scale, preferably with metric indicators.
2. A controlled source of continuous and/or intermittent suction.
3. Incubators and/or radiant warmers for adequate thermal support.
4. Equipment for determination of blood glucose at the bedside.
5. A device for the external measurement of blood pressure from the infant's arm or thigh.
7. A headbox assembly (oxygen hood), an oxygen blending device, and warming nebulizer for short-term administration of oxygen.
8. An oxygen analyzer that displays the ambient concentration of oxygen.
10. An infusion pump that can deliver appropriate volumes of continuous fluids and/or medications for newborns.
11. A fully equipped neonatal resuscitation cart.
12. Positive pressure ventilation equipment and masks; endotracheal tubes in all the appropriate sizes for neonates.
13. A laryngoscope with premature and infant size blades.
15. Laryngeal mask airway (LMA, size 1)
V. LABORATORY DATA

A. Maternal

In-house laboratory capabilities should include the following procedures:

- Hemoglobin
- Serum glucose
- Urinalysis

B. Neonatal

In-house laboratory capabilities should include the following procedures, utilizing microvolume samples, when possible. In most instances, abnormal results will indicate a need for consultation and/or transfer of the baby.

- Hemoglobin
- Serum glucose
LEVEL I FACILITIES

I. SERVICES PROVIDED

The services provided by a Level I facility include education of personnel and parents, and anticipated low risk maternal and neonatal care. Specifically, the Level I facility should have the capacity to manage anticipated low risk pregnancy, labor and delivery; to care for well newborn infants; to identify the signs and symptoms of potential problems in the mother, fetus and neonate; and to stabilize sick mothers and/or infants pending their transfer to an appropriate facility.

A. Educational Services

Educational services should include the following:

1. Parent Education: Ongoing perinatal education programs for parents.

2. Nurses' Education: Programs for nurses should conform to the most recent edition of Tennessee Perinatal Care System Educational Objectives for Nurses, Level I, published by the Tennessee Department of Health. These courses may be made available periodically at the Level I facility by instructors from a Regional Perinatal Center. The courses may also transpire at a Regional Perinatal Center, or at any other site remote from the hospital, thus requiring that the hospital provide nurses with educational leave for attendance. The Level I hospital is responsible for the necessary arrangements for nurse education. Nurses should maintain a level of competency in electronic fetal monitoring (EFM) as determined by their institution. Competency in Advanced Cardiac Life Support (ACLS) is recommended for all nurses who provide post-anesthesia care for obstetric patients.

3. Physicians' Education: Educational opportunities for physicians should be available upon request, provided by the instructional staff of the Regional Perinatal Center and by qualified individuals on the staff of the Level I institution. Physicians should maintain a level of competency in electronic fetal monitoring (EFM) as determined by their institution.

4. All perinatal care providers, including anesthesia care providers, should maintain current Neonatal Resuscitation Program (NRP) provider status. All newborn care providers should also maintain current S.T.A.B.L.E. provider status.

B. Maternal-Fetal Care

2. **Fetal Evaluation**: A capability for continuous electronic fetal monitoring of the fetus should be maintained. Ultrasound technology for fetal evaluation should be available.

3. **Complicated Patients**: Personnel should be capable of identifying and stabilizing maternal-fetal complications that require intervention before transfer to another facility. There should be an ongoing relationship for consultative services in accordance with EMTALA guidelines. Care of complicated patients requires direct consultation with the referral facility. The availability of anesthesia, radiologic services, and laboratory/blood bank services should be appropriate for effective support of these emergencies.

4. **Cesarean Section**: Personnel should maintain the capability to perform cesarean section in accordance with the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

5. **Postpartum Care**: Personnel should provide care for anticipated low risk patients during the postpartum period. In the event of complications, consultation and/or referral should be sought when appropriate.

C. **Neonatal Care**

A Level I facility should provide basic neonatal care as follows (see the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists):

1. **Newborn services have the capabilities to**:

   Provide neonatal care at every delivery according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program.

   Evaluate and provide postnatal care to stable term newborn infants.

   Stabilize and provide care for infants born at 35 - 37 weeks or more gestation who remain physiologically stable.

   Stabilize newborn infants who are ill and those born at <35 weeks’ gestation until transfer to a facility that can provide the appropriate level of neonatal care. Provide neonatal post-resuscitation care and pre-transport stabilization care per the most recent edition of the S.T.A.B.L.E. Program.

2. **Referred Infants**:

   Provide continuing care for infants who are back transferred from a referral facility, after their acute problems have been resolved.
D. Support Services

1. Blood and fresh frozen plasma should be available in-house or on-call 24 hours daily.

2. Anesthesia services will be available for obstetric emergencies including cesarean section, consistent with the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

   Regional anesthesia should be initiated and maintained only by health care providers who are approved through the institutional credentialing process to administer or supervise the administration of obstetric anesthesia. These individuals must be qualified to manage anesthetic complications.

3. Respiratory therapists who are current Neonatal Resuscitation Program (NRP) providers should be available in-house or on-call 24 hours daily.

4. Radiologic and ultrasound services should be available 24 hours daily, including the capability to perform portable radiologic studies in the nursery.

5. Clinical laboratory services will be available, including a capacity to perform microanalyses listed in Section V (Laboratory Data) that are for the initial care of sick neonates.

6. A registered pharmacist should be immediately available for consultation 24 hours per day. Access to pediatric emergency medications should also be available 24 hours per day, as described in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

7. Breastfeeding educational services should be available as described in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

E. Social Services

Social services and family support should be available, provided either through the hospital or by utilization of public and private agencies.

F. Maintenance of Data

Care of the newborn is aided by effective communication of information about the mother and her fetus to the pediatrician or other health care provider. The following items represent the minimum information that should be in the medical record of each patient:
1. **Maternal**

- Name, hospital medical record number
- Age, gravidity, parity, etc.
- Date of first prenatal visit
- Gestation (weeks)
- Availability of prenatal records (including prenatal labs) on admission.
  Prenatal lab results that should be available on admission include: hepatitis B surface antigen, HIV, serology, Group B strep, blood type and Rh status, antibody status, rubella, gonorrhea, chlamydia, and other tests as appropriate
- Social history to include alcohol, drug, or tobacco use and/or history or suspicion of domestic violence
- Prior cesarean section
- Electronic fetal monitoring (Yes or No)
- Induction (Yes or No)
- Indications for induction
- Time of membrane rupture
- Presentation
- Type of delivery (cesarean section, type of forceps, vacuum extraction, spontaneous)
- Indication for cesarean section / operative vaginal delivery
- Time of birth
- Birthweight
- Apgar scores
- Resuscitation (Yes or No)
- Type of resuscitation
- Maternal-fetal complications
- Anesthesia (type)
- Infant status on leaving delivery room (normal, abnormal, expired)
- Physician’s name
- Nurse’s name
- Disposition
  - Discharged home
  - Transferred to a higher level of care / Receiving hospital /
    Transport service
  - Expired

2. **Neonatal**

- Name, gender, hospital medical record number
- Date of birth
- Birthweight
- Gestational age
- Apgar scores
- Maternal complications (test results relevant to neonatal care; maternal illness potentially affecting the fetus; history of illicit substance use or any other known socially high-risk circumstances; complications of pregnancy associated with abnormal fetal growth;
fetal anomalies, or abnormal results from tests of fetal well-being; information regarding labor and delivery; and situations in which lactation may be compromised)

- Discharge diagnoses
- Special care administered (specify)
- Documentation of newborn metabolic, hearing, and critical congenital heart disease (CCHD) screens, and immunizations and medications given
- Bilirubin screen (according to American Academy of Pediatrics guidelines)
- Disposition
  - Discharged home
  - Transferred to a higher level of care / Receiving hospital / Transport service
  - Expired

G. Quality Improvement

All Level I facilities must have the ability to initiate education and quality improvement programs to maximize patient safety and/or collaborate with higher level facilities to do so.

H. Consultation and Transfer

1. Maternal-Fetal: Planned deliveries at gestational ages below 35 weeks should be referred to an appropriate higher level of care. Consultation with an obstetric provider at the higher level facility is indicated if past history, prenatal course, and/or intrapartum or postpartum events indicate that mother or fetus is at risk.

2. Neonatal: Infants born at 35-37 weeks gestation are at higher risk for newborn complications, and appropriate pediatric consultation should be considered. Level I facilities should be able to stabilize newborn infants who are ill and those born at <35 weeks gestation until transfer to a higher level of care.

3. Protocols for maternal-fetal and neonatal transport should conform to the most recent edition of the *Tennessee Perinatal Care System Guidelines on Transportation*, published by the Tennessee Department of Health.

II. PERSONNEL: QUALIFICATIONS AND FUNCTIONS

A. Physicians

Co-directors of Level I facilities should be board certified in obstetrics and pediatrics, respectively. Family physicians may serve as co-directors if institutional necessity so indicates, or if board-certified individuals are not available.
B. Nursing

1. Required skills and knowledge for perinatal nurses are listed in the latest edition of *Tennessee Perinatal Care System Educational Objectives for Nurses, Level I*, published by the Tennessee Department of Health. All perinatal staff nurses should have the knowledge and skills that are prescribed in this publication, in addition to maintaining current NRP provider status. It is recommended that all nurses who provide post-anesthesia care to obstetric patients maintain Advanced Cardiac Life Support (ACLS) competency. All nurses who provide care to newborns should also maintain current S.T.A.B.L.E. provider status.

Adequate numbers of registered nurses who have completed unit orientation, demonstrated competence in the care of women and newborns, and can stabilize and transfer high risk women and newborns are immediately available at all times.

2. Every Level I facility should have a registered nurse(s) whose primary responsibility is the organization and supervision of nursing services in the labor/delivery area, the newborn nursery and/or the postpartum area.

C. Labor and Delivery

1. The physician or certified nurse midwife should examine the mother at appropriate intervals during labor. He or she should be immediately available during the later stages of labor. The physician should be present when fetal or maternal complications are imminent or apparent. All deliveries should be attended by a physician or certified nurse midwife, and a registered nurse. The physician or nurse midwife and the nurse should be capable of performing resuscitation of the mother and newborn infant.

2. Responsibility for following the course of labor and the status of the fetus may not be delegated by the physician or certified nurse midwife to anyone except a registered nurse (R.N.). The registered nurse is responsible for continuous assessment and evaluation of the course of labor, for the status of the fetus, and for the identification of abnormalities. The nurse should remain in attendance during labor, delivery and the immediate recovery period.

3. Every delivery should be attended by at least one person whose primary responsibility is for the newborn and who is capable of initiating neonatal resuscitation according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program guidelines. Either that person or someone else who is immediately available should have the skills required to perform a complete resuscitation, including endotracheal intubation and administration of medications. With multiple gestations, a separate team should be organized for each baby.

4. If a high-risk mother is unavoidably delivered at a Level I facility, additional qualified personnel should be present for the management of
the baby. A written plan should be devised to set forth in detail the procedures for gathering required additional equipment and personnel in the presence of complications.

D. Postpartum Period

1. Mother: The mother's care following delivery should be supervised by a physician or certified nurse midwife and administered by a registered nurse (R.N.) or a licensed practical nurse (L.P.N.) supervised by a registered nurse (R.N.).

2. Infant: An initial evaluation of every neonate after birth should be performed by the physician responsible for care of the infant or by a registered nurse (R.N.) with education and experience in the recognition of abnormalities. Serial observations should be performed according to a clearly delineated protocol that has been established by the medical and nursing personnel of the nursery.

The care of infants who require transport to another institution should be directly supervised by the physician. In instances of acute distress a physician or advanced practice nurse should be present. The physician's presence is of paramount importance when the transport team arrives.

Newborn Screening: Hearing, metabolic, and CCHD screening programs should adhere to the most recent State of Tennessee regulations and the most recent edition of *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

III. SPACE AND EQUIPMENT FOR INTRAPARTAL AND POSTPARTAL CARE

A. Physical Facilities and Equipment

Physical facilities and equipment should meet criteria published in the latest edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists. All rooms where babies are delivered should be kept at a temperature of 25 degrees C. (77 degrees F.) or higher to prevent hypothermia in the newborn. Separate facilities should be maintained for obstetric patients, but the obstetric unit may also be utilized for patients with gynecologic problems that do not involve infection.

B. Resuscitation

Provision must be made for resuscitation of infants at delivery. The capability for resuscitation should include assisted ventilation with oxygen administered by bag and mask or bag and endotracheal tube, chest compression, and appropriate intravascular therapy. A treatment station for this purpose should be located in each delivery room with the following: suction apparatus; a pulse oximeter; a source of blended oxygen; infant resuscitation positive pressure ventilation
equipment, masks and endotracheal tubes in appropriate sizes; laryngoscope and blades; appropriate drugs; and equipment for umbilical vessel catheterization. Infusion pumps must be immediately available. An optimal thermal environment for the infant should be provided by a radiant warmer that is immediately available.

IV. SPACE AND EQUIPMENT FOR THE NORMAL INFANT

A. Physical facilities and equipment should meet criteria published in the latest edition of the Guidelines for Perinatal Care, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

B. Minimal equipment for the newborn nursery:

1. A platform scale, preferably with metric indicators.
2. A controlled source of continuous and/or intermittent suction.
3. Incubators and/or radiant warmers for adequate thermal support.
4. Equipment for determination of blood glucose at the bedside.
5. Ability to provide intensive phototherapy.
6. A device for the external measurement of blood pressure from the infant's arm or thigh.
8. A headbox assembly (oxygen hood), an oxygen blending device, and warming nebulizer for short-term administration of oxygen.
9. An oxygen analyzer that displays the ambient concentration of oxygen.
10. A newborn pulse oximeter for non-invasive blood oxygen monitoring.
11. An infusion pump that can deliver appropriate volumes of continuous fluids and/or medications for newborns.
13. Positive pressure ventilation equipment and masks; endotracheal tubes in all the appropriate sizes for neonates.
15. A CO₂ detector.
16. Laryngeal mask airway (LMA, size 1)

V. LABORATORY DATA

A. Maternal

In-house laboratory capabilities should include the following procedures:

- Complete blood count
- Major blood groups and Rh typing; blood cross match
- Coombs' test, indirect
- Liver function tests
- Plasma fibrinogen
- Platelet count
- Prothrombin time
- INR
- Partial thromboplastin time
- Serum glucose
- Serum sodium, potassium, chloride, bicarbonate, creatinine, BUN, magnesium, and calcium
- Serum protein and albumin
- Urinalysis
- Drug screen
- Serologic test for syphilis
- Bacterial cultures (aerobic and anaerobic); sensitivities
- Group B strep screening and/or rapid Group B strep screening
- Rapid HIV testing
- Hepatitis B surface antigen

B. Neonatal

In-house laboratory capabilities should include the following procedures, utilizing microvolume samples, when possible. In most instances, abnormal results will indicate a need for consultation and/or transfer of the baby.

- Complete blood count
- Major blood group and Rh typing; blood cross match
- Coombs' test (direct and indirect)
- Serum glucose
- Serum bilirubin (total and direct)
- Blood gas/pH
- Urinalysis
- Drug screen
- Bacterial cultures and antibiotic sensitivities
- C-reactive protein (CRP)
- Serum sodium, potassium, chloride, bicarbonate, creatinine, BUN, magnesium, and calcium
LEVEL II FACILITIES - OBSTETRIC

I. SERVICES PROVIDED

Level II obstetric units have the capabilities of Level I institutions plus the requisites to care for women with more complex medical conditions, obstetric complications, and fetal conditions. The level of obstetric care provided by a hospital should be determined by the institution’s ability to meet the criteria specified by the ACOG / SMFM consensus statement. The goal of care is to ensure that both mother and newborn are cared for at the appropriate level of care by appropriate personnel.

Planned delivery of women with massive hemorrhage risk or infants with anticipated risk for Level III or IV care is not encouraged at Level II obstetric units.

Level II units should be able to provide:

- Care for women with:
  - Preeclampsia with severe features at term
  - Placenta previa with no prior uterine surgery
- Emergency stabilization for critically ill obstetric patients
- Emergency care for unplanned births of younger, smaller, or sicker babies before transfer to a facility at which newborn intensive care is provided.

A. Educational Services

Educational services should include the following:

1. **Parent Education**: Ongoing perinatal education programs for parents.

2. **Nurses’ Education**: Programs for nurses that conform to the latest edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level II*, for obstetric nurses, published by the Tennessee Department of Health. These courses should be made available periodically at Level II facilities by instructors on the staff of that institution and/or the staff from a Regional Perinatal Center. Courses may also transpire at a Regional Perinatal Center or at another site remote from the Level II hospital, thus requiring that the hospital provide nurses with educational leave for attendance. Level II hospitals are responsible for the necessary arrangements for nurse education.

3. **Physicians’ Education**: A program of courses for physicians should be provided by the instructional staff of the Regional Perinatal Center and by qualified individuals on the staff of the Level II institution.

4. All perinatal care providers should maintain current NRP provider status. Competency in Advanced Cardiac Life Support (ACLS) is recommended for all nurses who provide post-anesthesia care for obstetric patients.
5. All Level II programs are strongly encouraged to participate in a state or national continuous quality improvement initiative that includes ongoing data collection and review for benchmarking and evaluation of outcomes. Examples of continuous quality improvement initiatives available in Tennessee are those provided by TIPQC and THA.

### B. Antepartum Care

1. **Uncomplicated Patients**: Prenatal care for uncomplicated patients should meet criteria published in the latest edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

2. **Identification and Planning for High-Risk Patients**: Identification of the mother and fetus at high risk and multispecialty planning of management and therapy through the postpartum and neonatal periods should be routine. This planning should include consultation with, or transfer to, a Level III or Level IV facility.

3. **Medical and Surgical Complications**: Facilities must be available for patients with complications of pregnancy.

4. **Laboratory Services**: In-house or readily accessible laboratory services should be available.

5. **Fetal Evaluation**: A capability for continuous electronic fetal monitoring of mother and fetus should be maintained. Ultrasound technology for fetal evaluation should be available. The ultrasound unit should be immediately available for use in Labor and Delivery. Proper data storage and documentation are essential.

6. **Social Services**: Social services should be available, provided either through the hospital or by utilization of public and private agencies.

7. **Home Nursing**: Nursing services provided in patients' homes should be available if needed.

8. **Dietary and Lactation Consultation**: Dietary and lactation consultation services should be available as described in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

9. **Pharmacy**: A registered pharmacist should be immediately available for consultation 24 hours per day. Access to pediatric emergency medications should also be available 24 hours per day, as described in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.
C. **Intrapartum Care**

1. **Physical Facilities and Equipment:** Physical facilities and equipment should meet the criteria outlined in the latest edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists, and any additional criteria as herein outlined.

2. **Labor and Delivery Area:** Labor and delivery rooms should occupy a clearly and specifically designated area in the hospital.

3. **Complicated Intrapartum Care:** Personnel should be capable of identifying and stabilizing maternal-fetal complications that require intervention before transfer to another facility. There should be an ongoing relationship for consultative services in accordance with EMTALA guidelines. Care of complicated patients requires direct consultation with the referral facility.

4. **Cesarean Section:** Personnel should maintain the capability to perform cesarean section in accordance with the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists, or sooner if indicated.

5. **Anesthesia:** Anesthesia services should be available for obstetric emergencies including cesarean section, consistent with the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

6. **Blood Bank Services:** Blood bank services should be maintained at all times. An appropriately trained technician should be in-house 24 hours daily. All blood components must be available on an emergency basis, either on the premises or by pre-arrangement with another facility.

7. **Imaging:** Imaging services, including portable studies, should be available 24 hours daily.

8. **Fetal Monitoring:** A capability for continuous electronic monitoring of mother and fetus should be maintained. Ultrasound technology for fetal evaluation should be available. Ultrasound services should be immediately available for use in Labor and Delivery. Proper data storage and documentation are essential.

9. **Laboratory Services:** Clinical laboratory services should be available to fully support clinical obstetric functions.

D. **Postpartum Care**

1. **Space and Personnel:** There should be an area specifically designated for high-risk postpartum care. In this area, nursing care must be
administered by a registered nurse. A protocol for clinical observations is required. The care of low-risk mothers during the immediate recovery period must be administered or supervised by a registered nurse. A protocol for clinical observations is required.

2. **Discharge Planning and Education**: Specific personnel should be assigned this responsibility.

3. **Interconceptional Health Care**: Information on interconceptional health care issues should be provided, such as nutrition, folic acid use, lifestyle choices, and child spacing.

E. **Consultation and Transfer**

Level II facilities should maintain active relationships with a Level III or IV facility in the region for consultation and transfer. Protocols for maternal-fetal transport should conform to the most recent edition of the *Tennessee Perinatal Care System Guidelines for Transportation*, published by the Tennessee Department of Health. Unless emergency circumstances require otherwise, Level II facilities cannot receive transferred patients with maternal, fetal or neonatal illnesses.

The transport of mothers should be individually arranged by the Level II and Level III or Level IV facilities involved. If delivery is anticipated at a gestational age of less than 32 completed weeks or an estimated fetal weight of 1500 grams or less, or need for immediate pediatric subspecialty care is anticipated, transfer to a Level III or IV facility which provides the required services should be initiated.

F. **Maintenance of Data**

The following items represent the minimum information that should be in medical records maintained at Level II facilities:

- Name, hospital medical record number
- Age, gravidity, parity, etc.
- Date of first prenatal visit
- Gestation (weeks)
- Availability of prenatal records (including prenatal labs) on admission. Prenatal lab results that should be available on admission include: hepatitis B surface antigen, HIV, serology, Group B strep, blood type and Rh status, rubella, gonorrhea, chlamydia, and other tests as appropriate
- Social history to include alcohol, drug, or tobacco use and/or history or suspicion of domestic violence
- Prior cesarean section
- Electronic fetal monitoring (Yes or No)
- Induction (Yes or No)
- Indications for induction
- Time of membrane rupture
- Presentation
- Type of delivery (cesarean section, type of forceps, vacuum extraction, spontaneous)
• Indication for cesarean section / operative vaginal delivery
• Time of birth
• Birthweight
• Apgar scores (per current NRP guidelines)
• Resuscitation (Yes or No)
• Type of resuscitation
• Maternal-fetal complications
• Status of prenatal testing such as Group B strep, hepatitis B, etc.
• Anesthesia (type)
• Infant status on leaving delivery room (normal, abnormal, expired)
• Physician’s name
• Nurse’s name
• Disposition
  - Discharged home
  - Transferred to a Level III facility / Receiving hospital / Transport service
  - Expired

II. PERSONNEL: QUALIFICATIONS AND FUNCTIONS

Requirements for adequate staffing are based upon the assumption that patients will be transferred to a Level III or IV facility when their illnesses necessitate a level of care that exceeds the capability of Level II facilities.

A. Physicians

1. At a hospital with a Level II nursery, an active board-certified obstetrician-gynecologist or maternal fetal medicine specialist should be chief of the obstetric service.

2. The chiefs of the obstetric and neonatal services should coordinate the hospital’s perinatal care services and, in conjunction with other medical, anesthesia, nursing, respiratory therapy, and hospital administration staff, develop policies concerning staffing, procedures, equipment, and supplies. These physicians are responsible for setting the hospital’s standard of perinatal care by working together to incorporate evidence-based practice patterns and nationally recognized care standards.

3. Regional anesthesia should be initiated and maintained only by health care providers who are approved through the institutional credentialing process to administer or supervise the administration of obstetric anesthesia. These individuals must be qualified to manage anesthetic complications.

4. Normal deliveries should be attended by a physician or a certified nurse midwife, and a registered nurse.

5. Every delivery should be attended by at least one person whose primary responsibility is for the newborn and who is capable of initiating neonatal resuscitation according to the American Heart Association and American
Academy of Pediatrics Neonatal Resuscitation Program guidelines. Either that person or someone else who is immediately available should have the skills required to perform a complete resuscitation, including endotracheal intubation and administration of medications.

6. Deliveries of high-risk fetuses should be attended by an obstetrician and at least two other persons qualified in neonatal resuscitation whose only responsibility is the neonate. With multiple gestations, each newborn should have his or her own dedicated team of care providers who are capable of performing neonatal resuscitation according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program guidelines.

B. Nurses

1. The Nurse Manager (R.N.) is responsible for all obstetric nursing activities. The nurse manager in a hospital with a Level II nursery must complete the Level II obstetrics course prescribed in the most recent edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level II*, published by the Tennessee Department of Health.

2. Staff nurses in obstetrics working in facilities with Level II nurseries must complete the Level II obstetrics course outlined in the most recent edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level II*, published by the Tennessee Department of Health. Nurses should maintain institutional unit-specific competencies. In addition, all nurses should be NRP providers. It is recommended that all nurses who provide post-anesthesia care to obstetric patients maintain ACLS competency.

3. Recommended Registered Nurse (R.N.) / Patient Ratios for Perinatal Care (Association of Women’s Health, Obstetric, and Neonatal Nurses *Guidelines for Professional Registered Nurse Staffing for Perinatal Units*, 2010):

<table>

</tr>
</tbody>
</table>
1:5-6  Postpartum patients without complications (no more than 2-3 of these patients should be recovering on the immediate post-operative day from cesarean birth)

4. The mother's care immediately following delivery must be supervised by a registered nurse. An institutional protocol for clinical observation is required.

5. A registered nurse is primarily responsible for the organization of care in the postpartum unit.

C. Social Services / Case Management

Personnel experienced in dealing with perinatal issues, discharge planning and education, follow-up and referral, home care planning, and bereavement support should be available to perinatal unit staff members and families.

D. Nutritionist / Dietitian / Lactation Consultant

The staff must include at least one dietitian or nutritionist who has special training in perinatal nutrition and can plan diets that meet the special needs of high risk antepartum and postpartum women. Availability of lactation consultants 7 days a week is recommended to assist with complex breastfeeding issues. In Level II perinatal centers, 1.6 full-time equivalent lactation consultants are recommended for every 1,000 births based on annual birth volume (Association of Women’s Health, Obstetric, and Neonatal Nurses Guidelines for Professional Registered Nurse Staffing for Perinatal Units, 2010).

III. SPACE AND EQUIPMENT FOR LEVEL II FACILITIES

Physical facilities and equipment should meet criteria published in the latest edition of the Guidelines for Perinatal Care, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.
LEVEL II FACILITIES - NEONATAL

I. INTRODUCTION

Level II nurseries provide specialty neonatal services.

Level II units have the capabilities of Level I nurseries, plus:

- Provide care for infants born at >32 weeks’ gestation and weighing >1500 grams who have physiologic immaturity or who are moderately ill with problems that are expected to resolve rapidly and are not anticipated to need subspecialty services on an urgent basis.

- Provide mechanical ventilation for brief duration (<24 hours) and provide continuous positive airway pressure (CPAP).

- Stabilize infants born at <32 weeks’ gestation and weighing <1500 grams until transfer to a neonatal intensive care facility.

- Provide care for infants who are convalescing after intensive care.

(American Academy of Pediatrics Levels of Neonatal Care, 2012)

II. SERVICES PROVIDED

A. Educational Services

Educational services should include the following:

1. **Parent Education**: Ongoing perinatal education programs for parents.

2. **Nurses’ Education**: Programs for nurses that conform to the latest edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level II*, for neonatal nurses, published by the Tennessee Department of Health. These neonatal courses should be made available periodically at Level II facilities by instructors on the staff of that institution and/or the staff from a Regional Perinatal Center. Courses may also transpire at a Regional Perinatal Center or at another site remote from the Level II hospital, thus requiring that the hospital provide nurses with educational leave for attendance. Level II hospitals are responsible for the necessary arrangements for nurse education.

3. **Physicians’ Education**: Educational opportunities for physicians should be available upon request, provided by the instructional staff of the institution.

---

6 The wording of this sentence was revised to better reflect that found in the *Guidelines for Perinatal Care, 8th edition*. A motion was properly made and seconded to approve this change at the Perinatal Advisory Committee meeting on July 11, 2019. The motion passed unanimously.
Regional Perinatal Center and by qualified individuals on the staff of the Level II institution.

4. All neonatal care providers should maintain both current NRP and S.T.A.B.L.E. provider status. The S.T.A.B.L.E. Cardiac Module is also recommended.

B. Ancillary Services

1. Laboratory Services: Laboratory capabilities should include but not be limited to the following:

   a. Routine Availability
      - Clotting factors
      - Serum total protein
      - Serum albumin
      - Serum IgM
      - Serum triglycerides (for parenteral nutrition)
      - Metabolic screen
      - Liver function tests
      - Serologic test for syphilis
      - Serology for hepatitis
      - Screening for HIV
      - TORCH titers
      - Viral cultures

   b. Available 24 Hours - 7 Days Per Week
      - Hematocrit
      - Hemoglobin
      - Complete blood count
      - Reticulocyte count
      - Blood typing: major groups and Rh
      - Cross match
      - Minor blood group antibody screen
      - Coombs’ test
      - Prothrombin time
      - Partial thromboplastin time
      - Platelet count
      - Fibrinogen concentration
      - Serum sodium, potassium, chloride
      - Serum calcium
      - Serum phosphorus
      - Serum magnesium
      - Serum blood glucose
      - Therapeutic drug levels
      - Serum bilirubin, total and direct
      - Blood gases/pH
• Blood urea nitrogen
• Serum creatinine
• Serum/urine osmolalities
• Urinalysis
• Cerebrospinal fluid: cells, chemistry
• Bacterial cultures and sensitivities
• C-reactive protein (CRP)
• Gram stain
• Toxicology
• Group B strep screening

2. **Blood Bank Services:** Blood bank services should be maintained at all times. An appropriately trained technician should be in-house 24 hours daily. All blood components must be available on an emergency basis, either on the premises or by pre-arrangement with another facility.

C. **Consultation and Transfer**

The Level II facility should maintain an active relationship with a Level III or Level IV facility in the region for consultation and transfer. Protocols for transport should conform to the most recent edition of the *Tennessee Perinatal Care System Guidelines on Transportation*, published by the Tennessee Department of Health.

**Neonatal Consultation and Transport:** When the severity of an illness requires a level of care that exceeds the capacity of the Level II facility, the infant should be transferred to a Level III or Level IV institution capable of providing required care. Transfer of these infants should be provided after consultation with the receiving Level III or Level IV unit. Refer to the most recent edition of the *Tennessee Perinatal Care System Guidelines on Transportation*, published by the Tennessee Department of Health, for more information.

D. **Maintenance of Data**

The following items represent the minimum information that should be in medical records maintained at Level II facilities:

- Name, gender, hospital medical record number
- Date of birth
- Birthweight
- Gestational age
- Apgar scores
- Maternal complications (test results relevant to neonatal care; maternal illness potentially affecting the fetus; history of illicit substance use or any other known socially high-risk circumstances; complications of pregnancy associated with abnormal fetal growth, fetal anomalies, or abnormal results from tests of fetal well-being; information regarding labor and delivery; and situations in which lactation may be compromised)
- Discharge diagnoses
• Special care administered (specify)
• Documentation of newborn metabolic, hearing and critical congenital heart disease (CCHD) screens, and immunizations and medications given
• Bilirubin screen (according to American Academy of Pediatrics guidelines)
• Disposition
  - Discharged home
  - Transferred to a higher level of care / Receiving hospital / Transport service
  - Expired

III. PERSONNEL: QUALIFICATIONS AND FUNCTIONS

Requirements for adequate staffing are based upon the assumption that patients will be transferred to a Level III or Level IV facility when their illnesses necessitate a level of care that exceeds the capabilities of Level II facilities. Level II nurseries must have the personnel (e.g., physicians, specialized nurses, respiratory therapists, radiology technicians, laboratory technicians) and equipment (e.g., portable chest radiograph, blood gas laboratory) continuously available to provide ongoing care as well as to address emergencies. When the unit has an infant on a ventilator, specialized personnel must be available on site to manage respiratory emergencies.

A. Physicians

1. In a Level II hospital, a board-certified pediatrician with subspecialty certification in neonatal-perinatal medicine should be chief of the neonatal care service. The chief should assure that appropriate trained and adequate staff are available at all times.

2. The co-directors of perinatal services should coordinate the hospital’s perinatal care services and, in conjunction with other medical, anesthesia, nursing, respiratory therapy, and hospital administration staff, develop policies concerning staffing, procedures, equipment, and supplies. The medical directors of obstetrics and neonatology are responsible for setting the hospital’s standard of perinatal care by working together to incorporate evidence-based practice patterns and nationally recognized care standards.

3. Every delivery should be attended by at least one person whose primary responsibility is for the newborn and who is capable of initiating neonatal resuscitation according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program guidelines. Either that person or someone else who is immediately available should have the skills required to perform a complete resuscitation, including endotracheal intubation and administration of medications.

4. Deliveries of high-risk fetuses should be attended by an obstetrician and at least two other persons qualified in neonatal resuscitation whose only responsibility is the neonate. With multiple gestations, each newborn
should have his or her own dedicated team of care providers who are capable of performing neonatal resuscitation according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program guidelines.

B. Nurses

1. The nurse manager (R.N.) is responsible for all nursing activities in the nurseries of Level II facilities. The nurse manager in a hospital with a Level II nursery must complete the Level II neonatal courses prescribed for staff nurses in the most recent edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level II*, published by the Tennessee Department of Health.

2. All staff nurses (R.N.) must be skilled in the observation and treatment of sick infants. For Level II facilities, they must complete the Level II neonatal course for nurses outlined in the most recent edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses*, published by the Tennessee Department of Health. Nurses should maintain institutional unit-specific competencies. In addition, all nurses should be current NRP and S.T.A.B.L.E. providers.

3. Recommended Registered Nurse (R.N.) / Patient Ratios for Newborn Care (Association of Women’s Health, Obstetric, and Neonatal Nurses *Guidelines for Professional Registered Nurse Staffing for Perinatal Units*, 2010):

<table>
<thead>
<tr>
<th>Ratio</th>
<th>Care Provided</th>
</tr>
</thead>
<tbody>
<tr>
<td>1:5-6</td>
<td>Newborns requiring only routine care</td>
</tr>
<tr>
<td>1:3-4</td>
<td>Newborns requiring continuing care</td>
</tr>
<tr>
<td>1:2-3</td>
<td>Newborns requiring intermediate care</td>
</tr>
<tr>
<td>1:1-2</td>
<td>Newborns requiring intensive care</td>
</tr>
<tr>
<td>1:1</td>
<td>Newborns requiring multisystem support</td>
</tr>
<tr>
<td>1 or more :1</td>
<td>Unstable newborns requiring complex critical care</td>
</tr>
</tbody>
</table>

C. Respiratory Therapists

Respiratory therapists who can provide supplemental oxygen, assisted ventilation and continuous positive pressure ventilation (including high flow nasal cannula) of neonates with cardiopulmonary disease should be continuously available on site to provide ongoing care as well as to address emergencies.

D. Social Services / Case Management

Personnel experienced in dealing with perinatal issues, discharge planning and education, follow-up and referral, home care planning, and bereavement support should be available to intermediate and intensive care unit staff members and families.
E. **Dietitian / Lactation Consultant**

The staff must include at least one dietitian who has special training in perinatal nutrition and can plan diets that meet the special needs of high risk neonates. Availability of lactation consultants 7 days a week is recommended to assist with complex breastfeeding issues. 1.6 full-time equivalent lactation consultants are recommended for every 1,000 births based on annual birth volume in Level II perinatal centers (Association of Women’s Health, Obstetric, and Neonatal Nurses *Guidelines for Professional Registered Nurse Staffing for Perinatal Units*, 2010).

F. **Pharmacist**

A registered pharmacist with expertise in compounding and dispensing medications, including total parenteral nutrition (TPN) for neonates must be available 24 hours per day.

IV. **SPACE AND EQUIPMENT FOR LEVEL II FACILITIES**

A. Physical facilities and equipment should meet criteria published in the latest edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

B. Minimal equipment for care of the normal infant includes:

1. A platform scale, preferably with metric indicators.
2. A controlled source of continuous and/or intermittent suction.
3. Incubators and/or radiant warmers for adequate thermal support.
4. Equipment for determination of blood glucose at the bedside.
5. Ability to provide intensive phototherapy.
6. A device for the external measurement of blood pressure from the infant's arm or thigh.
8. A headbox assembly (oxygen hood), an oxygen blending device, and warming nebulizer for short-term administration of oxygen.
9. An oxygen analyzer that displays the ambient concentration of oxygen.
10. A newborn pulse oximeter for non-invasive blood oxygen monitoring.
11. An infusion pump that can deliver appropriate volumes of continuous fluids and/or medications for newborns.
13. Positive pressure ventilation equipment and masks; endotracheal tubes in all the appropriate sizes for neonates.
15. A CO₂ detector.
16. Laryngeal mask airway (LMA, size 1)
C. Intermediate Care Nursery

Additional equipment needed for intermediate care newborns includes:

1. A servo-controlled incubator or heated open bed for each infant who requires a controlled thermal environment.
2. Cardiorespiratory monitors that include pressure and waveform monitoring.
3. Oxygen analyzers, blenders, heaters, and humidifiers sufficient for anticipated census.
4. A sufficient number of headbox assemblies (oxygen hoods).
5. Modes of respiratory support: binaural cannulas, conventional mechanical ventilator, mechanism to deliver nasal CPAP.
6. A bag or t-piece resuscitator and mask for each infant.
7. An adequate supply of endotracheal tubes and other intubation supplies and LMA.
8. A device for viewing x-rays in the infant area.
LEVEL III FACILITIES - OBSTETRIC

I. INTRODUCTION

Level III obstetric units possess the capabilities of Level II institutions plus the requisites to care for women with a broad range of medical conditions, obstetric complications, and fetal conditions. The level of obstetric care provided by a hospital should be determined by the institution’s ability to meet the criteria specified by the ACOG / SMFM consensus statement. The goal of care is to ensure that both mother and newborn are cared for at the appropriate level of care by appropriate personnel.

The responsibilities and capabilities that are prescribed for these facilities are solely concerned with the level of patient care. Designation as a Level III facility does not imply designation as a Regional Perinatal Center. The additional responsibilities of Regional Perinatal Centers are described elsewhere in these Guidelines.

II. SERVICES PROVIDED

A. Educational Services

Educational services should include the following:

1. **Parent Education**: Ongoing perinatal education programs for parents.

2. **Education of Personnel**: Level III units are required to provide ongoing educational programs for their nurses that conform to the latest edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level III*, published by the Tennessee Department of Health. Outreach educational activities are not required.

3. **Physicians' Education**: Level III units are required to provide ongoing educational programs for physicians practicing in that institution. Outreach educational activities are not required.

4. All perinatal care providers should maintain current NRP provider status. It is recommended that all nurses who provide post-anesthesia care to obstetric patients maintain Advanced Cardiac Life Support (ACLS) competency.

B. Antepartum Care

A complete range of prenatal care for normal and complicated patients will be provided as follows:

1. **Uncomplicated Patients**: Prenatal care for uncomplicated patients should meet standards published in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.
2. **Identification of High-Risk Mothers:** Identification and multispecialty planning for management and therapy of the mother and the fetus at high risk must be ongoing.

3. **In-patient Care of Complications:** An antenatal area must be available for patients with complications of pregnancy.

4. **Laboratory Services:** In-house or readily accessible laboratory services to assess fetal and maternal well-being must be available. Appropriate turnaround time for laboratory results is indispensable.

5. **Evaluation of Fetus:** The full range of antepartum surveillance techniques must be available in house 24 hours a day. Access to genetic consultation and invasive fetal procedures (PUBS, CVS, others) should be available.

6. **Social Work:** Full-time licensed social workers with perinatal expertise must be on the staff of the hospital.

7. **Home Nursing:** Access to home nursing services should be available.

8. **Dietary and Lactation Consultation:** Dietary and lactation consultation services should be available as described in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

9. **Pharmacy:** A registered pharmacist should be immediately available for consultation 24 hours per day. Access to emergency medications should also be available 24 hours per day, as described in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

C. **Intrapartum Care**

1. **Medical Personnel:** An obstetrician and an anesthesiologist must be in-house 24 hours daily in order to provide an acceptable level of patient care. Sufficient resources should be available to support this staffing pattern. Consultation with a Board-certified or active candidate maternal-fetal medicine specialist must be available.

2. **Physical Facilities and Equipment:** Physical facilities and equipment should meet the standards in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists, and any additional criteria as herein presented.

3. **Labor and Delivery Area:** Labor and delivery rooms must occupy a clearly and specifically designated area in the hospital.
4. **Intensive Care Area:** The ability to provide intensive care for intrapartum patients must be provided. Nursing care of high-risk patients must be administered by qualified registered nurses who possess both critical care and obstetrical care knowledge and skills.

5. **Cesarean Section:** Personnel should maintain the capability to perform cesarean section in accordance with the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists, or sooner if indicated.

6. **Anesthesia:** Anesthesia services must be immediately available in-house 24 hours daily.

7. **Blood Bank Services:** Blood bank services must be maintained at all times. An appropriately trained technician should be available in-house 24 hours daily. All blood components must be obtainable on an emergency basis, on the premises. A massive transfusion protocol is strongly recommended.

8. **Imaging:** Imaging services must be available 24 hours daily, including the capacity to perform portable studies, CT, and/or MRI. Personnel who perform these services must be available 24 hours daily.

9. **Fetal Monitoring:** A capability for continuous electronic monitoring of mother and fetus must be maintained. Ultrasound technology for fetal evaluation should be available 24 hours daily. In addition, ultrasound services must be immediately available for use in labor and delivery. Proper data storage and documentation are essential.

10. **Laboratory Services:** Clinical laboratory services must be available to fully support clinical obstetric functions.

D. **Postpartum Care**

1. **Postpartum Area:** There must be specifically designated areas for postpartum care.

2. **Intensive Care:** Space, equipment and personnel for intensive care in the postpartum period must be provided. Nursing care of high-risk patients must be administered by qualified registered nurses who possess both critical care and obstetrical care knowledge and skills.

3. **Discharge Planning and Education:** Specific personnel should be assigned responsibility for assuring that mothers are given helpful preparation for the care of themselves and their newborns at home.

4. **Counseling for Complications:** Personnel who are specifically qualified should be assigned responsibility for fully discussing with parents the complications of pregnancy and their implications for future pregnancies.
and fetal outcomes. Special attention should be given to families who experience fetal or neonatal death. Bereavement support is essential. Counseling consults / referrals should be made as necessary.

5. **Interconceptional Health Care:** Information on interconceptional health care issues should be provided, such as nutrition, folic acid use, lifestyle choices, and child spacing.

### E. Consultation and Transfer

**Maternal-Fetal Transport:** If the Level III facility chooses to accept referred patients, it should supervise the transport of mothers who are referred by any institution. The logistics and mode of transport of each maternal patient should be individually determined by the Level III facility and the referring institution, conforming to the most recent edition of the *Tennessee Perinatal Care System Guidelines on Transportation*, published by the Tennessee Department of Health. Transport should also conform to regulations prescribed by the State of Tennessee. Detailed records of the maternal transport system should be maintained by the Level III facility.

### F. Maintenance of Data and Assessment of Quality Measures

A systematic ongoing compilation of data should be maintained to reflect the care of sick patients, in addition to the listing of minimal data that is specified for Level I and Level II facilities. All Level III programs should participate in a state or national continuous quality improvement initiative that includes ongoing data collection and review for benchmarking and evaluation of outcomes. Examples of continuous quality improvement initiatives available in Tennessee are those provided by TIPQC and THA.

### III. PERSONNEL: QUALIFICATIONS AND FUNCTIONS

#### A. Physicians

1. **Director:** The director of the maternal-fetal medicine service of a hospital providing subspecialty care should be a full-time, board-certified obstetrician with subspecialty certification in maternal-fetal medicine. The director is responsible for maintaining practice guidelines and, in cooperation with the obstetric medical director, nursing, and hospital administration, is responsible for developing the operating budget; evaluating and purchasing equipment; planning, developing, and coordinating in-hospital and outreach educational programs; and participating in the evaluation of perinatal care.

2. **Obstetricians:** Board-certified (or active candidate) obstetricians, whose qualifications and appointments have been approved by the appropriate hospital committee, may assume primary responsibility for the hospital care of high-risk patients. However, the institution is responsible for development of guidelines that prescribe circumstances in which the obstetrician will consult the maternal-fetal specialist.
3. Normal deliveries should be attended by a physician or a certified nurse midwife, and a registered nurse.

4. Every delivery should be attended by at least one person whose primary responsibility is for the newborn and who is capable of performing neonatal resuscitation according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program guidelines. Either that person or someone else who is immediately available should have the skills required to perform a complete resuscitation, including endotracheal intubation and administration of medications.

5. Deliveries of high-risk fetuses should be attended by an obstetrician and at least two other persons qualified in neonatal resuscitation whose only responsibility is the neonate. With multiple gestations, each newborn should have his or her own dedicated team of care providers who are capable of performing neonatal resuscitation according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program guidelines.

6. **Anesthesiologists:** Obstetric anesthesia services should be directed by a board-certified anesthesiologist who has experience or subspecialty training in obstetric anesthesia.

7. **Sub-specialty Consultants:** Sub-specialty consultants for obstetric patients should include, at a minimum, neonatologist available for antepartum / intrapartum consultation, hematologist, cardiologist, and other appropriate sub-specialists in internal medicine, such as infectious diseases and surgery. A geneticist for obstetric and newborn patients should maintain an ongoing service program, either as a member of the active staff of the hospital, or as a consultant whose responsibility for the hospital’s genetic program is clearly identifiable.

**B. Nurses**

1. The nurse manager in a maternal-fetal unit should have completed education according to the most recent edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level III*, for obstetric nurses, published by the Tennessee Department of Health. A baccalaureate degree is required.

2. In Level III facilities, staff nurses (R.N.) in obstetrics who are responsible for Level II or Level III care should have completed Level III education according to the most recent edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level III*, for obstetric nurses, published by the Tennessee Department of Health. Nurses should maintain institutional unit-specific competencies. In addition, all nurses should be current NRP providers. Nurses should maintain a level of competency in electronic fetal monitoring (EFM) as determined by their
institution. It is recommended that all nurses who provide post-anesthesia care to obstetric patients maintain ACLS competency.

3 The Level III obstetric unit should have at least one obstetric nurse on its full-time staff who is responsible for staff education. This nurse should either be masters’ prepared or actively pursuing an advanced degree.

4 Recommended Registered Nurse (R.N.) / Patient Ratios for Perinatal Care (Association of Women’s Health, Obstetric, and Neonatal Nurses Guidelines for Professional Registered Nurse Staffing for Perinatal Units, 2010):

<table>
<thead>
<tr>
<th>Ratio</th>
<th>Care Provided</th>
</tr>
</thead>
<tbody>
<tr>
<td>1:2</td>
<td>Patients in labor without complications</td>
</tr>
<tr>
<td>1:1</td>
<td>Patients in second stage of labor</td>
</tr>
<tr>
<td>2:1</td>
<td>Birth. 1 nurse responsible for the mother and 1 nurse whose sole responsibility is the baby</td>
</tr>
<tr>
<td>1:1</td>
<td>Patients with medical or obstetric complications</td>
</tr>
<tr>
<td>1:1</td>
<td>Patients receiving oxytocin during labor</td>
</tr>
<tr>
<td>1:1</td>
<td>Coverage for initiating epidural anesthesia</td>
</tr>
<tr>
<td>1:1</td>
<td>Patients in the immediate postoperative recovery period (at least the first 2 hours after birth)</td>
</tr>
<tr>
<td>1:3</td>
<td>Antepartum and postpartum patients with complications but in stable condition</td>
</tr>
<tr>
<td>1:3</td>
<td>Mother-newborn couplets on the immediate postoperative day (no more than 2 of the mothers should be recovering from cesarean birth)</td>
</tr>
<tr>
<td>1:5-6</td>
<td>Postpartum patients without complications (no more than 2-3 of these patients should be recovering on the immediate post-operative day from cesarean birth)</td>
</tr>
</tbody>
</table>

In-house minimal staffing for care of antepartum and postpartum patients should be adequate to handle possible emergencies. Sufficient staff skilled in obstetrics should be immediately available and free to respond to these emergencies without decreasing the unit staffing below safe levels as described above.

C. Social Workers

The services of social workers should be made available by the hospital 24 hours daily. These services should be provided by a staff that is qualified in perinatal social work. This requires that social workers be educated according to the most recent edition of the Tennessee Perinatal Care System Educational Objectives in Medicine for Perinatal Social Workers, published by the Tennessee Department of Health.
D. **Case Manager / Discharge Coordinator**

Personnel experienced in dealing with discharge planning and education, follow-up and referral, and home care planning must be available to antepartum, intrapartum, and postpartum unit staff members, patients, and families.

E. **Dietitian / Lactation Consultant**

The staff must include at least one dietitian who has special training in perinatal nutrition and can plan diets that meet the special needs of high risk antepartum and postpartum women. Availability of lactation consultants 7 days a week is recommended to assist with complex breastfeeding issues. 1.9 full-time equivalent lactation consultants are recommended for every 1,000 births based on annual birth volume in Level III perinatal centers (Association of Women’s Health, Obstetric, and Neonatal Nurses *Guidelines for Professional Registered Nurse Staffing for Perinatal Units*, 2010).
LEVEL III FACILITIES - NEONATAL

I. INTRODUCTION

Level III nurseries provide neonatal intensive care (NICU) services.

Level III units have the capabilities of Level II nurseries, plus:

- Provide sustained life support
- Provide comprehensive care for infants born <32 weeks gestation and weighing <1500 grams and infants born at all gestational ages and birth weights with critical illness
- Provide prompt and readily available access to a full range of pediatric medical subspecialists, pediatric surgical specialists, pediatric anesthesiologists, and pediatric ophthalmologists
- Provide a full range of respiratory support that may include conventional and/or high-frequency ventilation and inhaled nitric oxide
- Perform advanced imaging with interpretation on an urgent basis, including computed tomography, MRI, and echocardiography

(American Academy of Pediatrics Levels of Neonatal Care, 2012)

The responsibilities and capabilities that are prescribed for these facilities are solely concerned with the level of patient care. Designation as a Level III facility does not imply designation as a Regional Perinatal Center. The additional responsibilities of Regional Perinatal Centers are described elsewhere in these Guidelines.

II. SERVICES PROVIDED

A. Educational Services

Educational services should include the following:

1. Parent Education: Ongoing perinatal education programs for parents.

2. Nurses' Education: Level III units are required to provide ongoing educational programs for their nurses that conform to the latest edition of the Tennessee Perinatal Care System Educational Objectives for Nurses, Level III, for neonatal nurses, published by the Tennessee Department of Health. Outreach educational activities are not required.

3. Physicians' Education: Level III units are required to provide ongoing educational programs for physicians practicing in that institution. Outreach educational activities are not required.
4. All neonatal care providers should maintain both current NRP and S.T.A.B.L.E. provider status. The S.T.A.B.L.E. Cardiac Module is also recommended.

B. Neonatal Care

Level III facilities accommodate normal infants (unless located in a free-standing children's hospital), moderately ill, and severely ill infants who are either inborn or are transferred from other hospitals. The care of normal neonates should conform to the standards published in the most recent edition of the Guidelines for Perinatal Care, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists. The principal commitment of all Level III facilities is the care of sick neonates in an intensive care unit that is staffed and equipped to treat the most severe and complex neonatal disorders.

1. Resuscitation: Provision must be made for resuscitation of infants immediately after birth. Resuscitation capabilities should include assisted ventilation with blended oxygen administered by bag or T-piece resuscitator with mask or endotracheal tube, chest compression, and appropriate intravascular therapy. Refer to the most recent edition of the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program Guidelines for a complete list of resuscitation equipment and supplies.

2. Transport from Delivery Room to the Special Care Nursery: Transport to a special care nursery requires a capacity for uninterrupted support. An appropriately equipped pre-warmed transport incubator, with blended oxygen, should be used for this purpose.

3. Transitional Care: Recurrent observation of the neonate should be performed by personnel who can identify and respond to the early manifestations of neonatal disorders.

4. Care of Sick Neonates: The care of moderately and severely ill infants entails the following essentials:

   a. Continuous cardiorespiratory monitoring.
   b. Serial blood gas determinations and non-invasive blood gas monitoring.
   c. Periodic blood pressure determinations (intra-arterial when necessary).
   d. Portable diagnostic imaging for bedside interpretation.
   e. Availability of electrocardiograms and echocardiograms with rapid interpretation.
   f. Laboratory Services: Clinical laboratory services must be available to fully support clinical neonatal functions.
   g. Fluid and electrolyte management and administration of blood and blood components.
   h. Phototherapy and exchange transfusion.
i. Administration of parenteral nutrition through peripheral or central vessels.

j. Provision of appropriate enteral nutrition and lactation support.

5. **Mechanical Ventilatory Support:** The Level III unit must be qualified to provide mechanical ventilatory support. The essential qualifications are as follows:

   a. Continuous in-house presence of personnel experienced in airway management, endotracheal intubation, and diagnosis and treatment of air leak syndromes.

   b. A staff of nurses (R.N.) and respiratory therapists (R.T.) who are specifically educated in the management of neonatal respiratory disorders.

   c. Blood gas determinations and other data essential to treatment must be available 24 hours daily.

   d. Level III nurseries should be able to provide a full range of respiratory support, including sustained conventional and/or high frequency ventilation and inhaled nitric oxide.

6. **Diagnostic Imaging:** Perform advanced imaging, with interpretation on an urgent basis, including CT, MRI, and echocardiography.

7. **Laboratory Services:** Clinical laboratory services must be available to fully support clinical neonatal functions.

8. **Blood Bank Services:** Blood bank services must be maintained at all times. An appropriately trained technician should be available in-house 24 hours daily. All blood components must be obtainable on an emergency basis, either on the premises or by pre-arrangement with another facility.

C. **Consultation and Transfer**

1. **Neonatal Transport:**

   a. The Level III facility that operates a transport service is required to maintain equipment and a trained team of personnel that must be available at all times for the transport of newborn patients. The Level III facility is responsible for transport of referred infants with its own equipment, or alternatively, with equipment from a commercial source.

   b. The Level III facility that operates a transport service should originate a protocol that describes procedures, staffing patterns, and equipment for the transport of referred infants. The protocol should conform to the most recent edition of the *Tennessee Perinatal Care System Guidelines on Transportation*, published by the Tennessee Department of Health.

   c. The Level III facility that operates a transport service is required to maintain records of its activities. (See the most recent edition of
The Tennessee Perinatal Care System Guidelines on Transportation.

D. Maintenance of Data and Assessment of Quality Measures

A systematic ongoing compilation of data should be maintained to reflect the care of sick patients, in addition to the listing of minimal data that is specified for Level I and Level II facilities. All Level III programs should participate in a state or national continuous quality improvement initiative that includes ongoing data collection and review for benchmarking and evaluation of outcomes. Examples of continuous quality improvement initiatives available in Tennessee are those provided by TIPQC and THA.

III. PERSONNEL: QUALIFICATIONS AND FUNCTIONS

A. Physicians

1. Director: The director of the newborn intensive care unit must be a full-time, board-certified pediatrician with subspecialty certification in neonatal-perinatal medicine. The director is responsible for maintaining practice guidelines and, in cooperation with nursing and hospital administration, is responsible for developing the operating budget; evaluating and purchasing equipment; planning, developing, and coordinating in-hospital and outreach educational programs; and participating in the evaluation of perinatal care.

2. Neonatologists: The attending physician for sick neonates must be fellowship-trained and board-certified or eligible to take the board certification exam in neonatal-perinatal medicine.

3. Pediatricians: A board-certified neonatologist must have primary and ultimate responsibility for infants who receive intensive care. Board-certified pediatricians, whose qualifications and appointments have been approved by the appropriate hospital committee, can care for infants who need more than routine care as long as they are under the supervision of a neonatologist.

4. In-House Coverage: In-house physician consultation and coverage should be provided 24 hours per day by a board-certified neonatologist or a board-certified neonatal nurse practitioner. However, when in-house coverage does not include a board-certified neonatologist, he/she must be on-call and available to be on-site within 30 minutes of request.

5. Every delivery should be attended by at least one person whose primary responsibility is for the newborn and who is capable of performing neonatal resuscitation according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program guidelines. Either that person or someone else who is immediately available should have the skills required to perform a complete
resuscitation, including endotracheal intubation and administration of medications.

6. Deliveries of high-risk fetuses should be attended by an obstetrician and at least two other persons qualified in neonatal resuscitation whose only responsibility is the neonate. With multiple gestations, each newborn should have his or her own dedicated team of care providers who are capable of performing complete neonatal resuscitation according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program guidelines.

7. Anesthesiologists: Pediatric anesthesia services should be directed by a board-certified anesthesiologist who has a special interest and an expertise in pediatric anesthesia.

8. Radiologists: A radiologist must be available on-call at all times.

9. Sub-specialty Consultants: For Level III units, qualified sub-specialists, including pediatric medical subspecialists, pediatric surgical specialists, pediatric anesthesiologists, and pediatric ophthalmologists, should be available on site or at a closely related institution by prearranged consultative agreement, ideally in close geographic proximity.

B. Nurses

1. The nurse manager of the Level III nursery should have completed education according to the most recent edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level III, Neonatal*, published by the Tennessee Department of Health. A baccalaureate degree is required.

2. Staff nurses (R.N.) must have received courses as outlined in the most recent edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level III,* for neonatal nurses, published by the Tennessee Department of Health. Nurses should maintain institutional unit-specific competencies. In addition, all nurses should be current NRP and S.T.A.B.L.E. providers.

3. The Level III nursery should have at least one neonatal nurse on its full-time staff who is responsible for staff education. This nurse should either be masters’ prepared or actively pursuing an advanced degree.

4. Recommended Registered Nurse (R.N.) / Patient Ratios for Newborn Care (Association of Women’s Health, Obstetric, and Neonatal Nurses Guidelines for Professional Registered Nurse Staffing for Perinatal Units, 2010):

<table>
<thead>
<tr>
<th>Ratio</th>
<th>Care Provided</th>
</tr>
</thead>
<tbody>
<tr>
<td>1:2-3</td>
<td>Newborns requiring intermediate care</td>
</tr>
<tr>
<td>1:1-2</td>
<td>Newborns requiring intensive care</td>
</tr>
<tr>
<td>1:1</td>
<td>Newborns requiring multisystem support</td>
</tr>
<tr>
<td>1 or more :1</td>
<td>Unstable newborns requiring complex critical care</td>
</tr>
</tbody>
</table>
C. Social Workers

The services of social workers should be made available by the hospital 24 hours daily. These services should be provided by a staff that is qualified in perinatal social work. This requires that social workers be educated according to the most recent edition of the *Tennessee Perinatal Care System Educational Objectives in Medicine for Perinatal Social Workers*, published by the Tennessee Department of Health.

D. Case Manager / Discharge Coordinator

Personnel experienced in dealing with discharge planning and education, follow-up and referral, and home care planning should be available to neonatal intensive care unit staff members and families.

E. Respiratory Therapists

Dedicated respiratory therapists who can provide the assisted ventilation of neonates with cardiopulmonary disease must be available. The nursery’s respiratory therapy director must be a registered respiratory therapist (R.R.T.).

F. Dietitian / Lactation Consultant

The staff must include at least one dietitian who is knowledgeable in the management of parenteral and enteral nutrition of low birthweight and other high-risk infants. Availability of lactation consultants 7 days a week is recommended to assist with complex breastfeeding issues. 1.9 full-time equivalent lactation consultants are recommended for every 1,000 births based on annual birth volume in Level III perinatal centers (Association of Women’s Health, Obstetric, and Neonatal Nurses *Guidelines for Professional Registered Nurse Staffing for Perinatal Units*, 2010).

G. Pharmacist

A registered pharmacist with expertise in compounding and dispensing medications for neonates must be included on staff. Registered pharmacists with expertise in dispensing neonatal medications, including total parenteral nutrition (TPN), must be available 24 hours a day.

H. Occupational Therapist / Physical Therapist / Speech Therapist

At least one occupational therapist or physical therapist and one speech therapist with neonatal expertise must be included on staff. These disciplines will work collaboratively with the medical and nursing staffs to provide developmentally appropriate care.

I. Neonatal Follow-up Services

Neonatal intensive care unit graduates who are considered high risk and those with birthweights <1500 grams should be enrolled in an organized follow-up
program that tracks and records medical and neurodevelopmental outcomes to allow later analysis.

IV. EQUIPMENT FOR THE INTENSIVE CARE NURSERY

Equipment in the intensive care nursery of a Level III facility should be adequate for the care of moderately and severely ill infants in accordance with contemporary standards. The quantities of all items of equipment should be sufficient to support the management of the maximum number of infants that are anticipated at times of peak census loads. An in-house Bioengineering Department should have an active program for preventive maintenance and rapid repair.
LEVEL IV FACILITIES - OBSTETRIC

I. INTRODUCTION

Level IV units provide care on site for the most complex maternal conditions of the critically ill pregnant woman and her fetus/es throughout the antepartum, intrapartum and postpartum care needed. The capabilities of the Level III center are supplemented by the ability of the Level IV center to provide specialized ICU care for obstetrical patients.

The level of obstetric care provided by a hospital should be determined by the institution’s ability to meet the criteria specified by the ACOG / SMFM consensus statement. The goal of care is to ensure that both mother and newborn are cared for at the appropriate level of care by appropriate personnel.

The responsibilities and capabilities that are prescribed for these facilities are solely concerned with the level of patient care. Designation as a Level IV facility does not imply designation as a Regional Perinatal Center. The additional responsibilities of Regional Perinatal Centers are described elsewhere in these Guidelines.

II. SERVICES PROVIDED

A. Educational Services

Educational services should include the following:

1. **Parent Education**: Ongoing perinatal education programs for parents.

2. **Education of Personnel**: Level IV units are required to provide ongoing educational programs for their nurses that conform to the latest edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level IV*, published by the Tennessee Department of Health. Outreach educational activities are not required.

3. **Physicians’ Education**: Level IV units are required to provide ongoing educational programs for physicians practicing in that institution. Outreach educational activities are not required to be provided.

4. All perinatal care providers should maintain current NRP provider status. It is recommended that all nurses who provide post-anesthesia care to obstetric patients maintain Advanced Cardiac Life Support (ACLS) competency.

B. Antepartum Care

A complete range of prenatal care for normal and complicated patients will be provided as follows:
1. **Uncomplicated Patients**: Prenatal care for uncomplicated patients should meet standards published in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

2. **Identification of High-Risk Mothers**: Identification and multispecialty planning for management and therapy of the mother and the fetus at high risk must be ongoing.

3. **In-patient Care of Complications**: An antenatal area must be available for patients with complications of pregnancy.

4. **Laboratory Services**: In-house or readily accessible laboratory services to assess fetal and maternal well-being must be available. Appropriate turnaround time for laboratory results is indispensable.

5. **Evaluation of Fetus**: The full range of antepartum surveillance techniques must be available in house 24 hours a day. Access to genetic consultation and invasive fetal procedures (PUBS, CVS, others) should be available.

6. **Social Work**: Full-time licensed social workers with perinatal expertise must be on the staff of the hospital.

7. **Home Nursing**: Access to home nursing services should be available.

8. **Dietary and Lactation Consultation**: Dietary and lactation consultation services should be available as described in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

9. **Pharmacy**: A registered pharmacist should be immediately available for consultation 24 hours per day. Access to emergency medications should also be available 24 hours per day, as described in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists.

### C. Intrapartum Care

1. **Medical Personnel**: A board certified or active candidate obstetrician and an anesthesiologist experienced in providing obstetric care must be in-house 24 hours daily in order to provide an acceptable level of patient care. Sufficient resources should be available to support this staffing pattern. Consultation with a board-certified (or active candidate) maternal-fetal medicine specialist must be available.

2. **Physical Facilities and Equipment**: Physical facilities and equipment should meet the standards in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics.
and the American College of Obstetricians and Gynecologists, and any additional criteria as herein presented.

3. **Labor and Delivery Area**: Labor and delivery rooms must occupy a clearly and specifically designated area in the hospital.

4. **Intensive Care Area**: The ability to provide intensive care for intrapartum patients must be provided. Nursing care of high-risk patients must be administered by qualified registered nurses who possess both critical care and obstetrical care knowledge and skills.

5. **Cesarean Section**: Personnel should maintain the capability to perform cesarean section in accordance with the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists, or sooner if indicated.

6. **Anesthesia**: Anesthesia services must be immediately available in-house 24 hours daily.

7. **Blood Bank Services**: Blood bank services must be maintained at all times. A trained technician should be available in-house 24 hours daily. All blood components must be obtainable on an emergency basis, on the premises. The facility must be able to handle patients with significant blood loss. A massive transfusion protocol is required.

8. **Imaging**: Imaging services must be available 24 hours daily, including the capacity to perform portable studies, CT, and/or MRI. Personnel who perform these services must be available 24 hours daily. The ability to perform interventional radiological procedures should be available on site.

9. **Fetal Monitoring**: A capability for continuous electronic monitoring of mother and fetus must be maintained. Ultrasound services for fetal evaluation should be available 24 hours daily. Preferably, Maternal Fetal Medicine should be actively involved in providing quality control for obstetrical ultrasound. In addition, an ultrasound unit must be immediately available for use in labor and delivery. Proper data storage and documentation are essential.

10. **Laboratory Services**: Clinical laboratory services must be available to fully support clinical obstetric functions.

**E. Postpartum Care**

1. **Postpartum Area**: There must be specifically designated areas for postpartum care.

2. **Intensive Care**: Space, equipment and personnel for intensive care in the postpartum period must be provided. Nursing care of high-risk patients must be administered by qualified registered nurses who possess both critical care and obstetrical care knowledge and skills.
3. **Discharge Planning and Education**: Specific personnel should be assigned responsibility for assuring that mothers are given helpful preparation for the care of themselves and their newborns at home.

4. **Counseling for Complications**: Personnel who are specifically qualified should be assigned responsibility for fully discussing with parents the complications of pregnancy and their implications for future pregnancies and fetal outcomes. Special attention should be given to families who experience fetal or neonatal death. Bereavement support is essential. Counseling consults / referrals should be made as necessary.

5. **Interconceptional Health Care**: Information on interconceptional health care issues should be provided, such as nutrition, folic acid use, lifestyle choices, and child spacing.

**E. Consultation and Transfer**

**Maternal-Fetal Transport**: If the Level IV facility chooses to accept referred patients, it should facilitate the transport of mothers who are referred by any institution. The logistics and mode of transport of each maternal patient should be individually determined by the Level IV facility and the referring institution, conforming to the most recent edition of the *Tennessee Perinatal Care System Guidelines on Transportation*, published by the Tennessee Department of Health. Transport should also conform to regulations prescribed by the State of Tennessee. Detailed records of the maternal transport system should be maintained by the Level IV facility.

**F. Maintenance of Data and Assessment of Quality Measures**

A systematic ongoing compilation of data should be maintained to reflect the care of sick patients, in addition to the listing of minimal data that is specified for Level I, Level II, and Level III facilities. All Level IV programs should participate in a state or national continuous quality improvement initiative that includes ongoing data collection and review for benchmarking and evaluation of outcomes. Examples of continuous quality improvement initiatives available in Tennessee are those provided by TIPQC and THA.

**III. PERSONNEL: QUALIFICATIONS AND FUNCTIONS**

**A. Physicians**

1. **Director**: The director of the maternal-fetal medicine service of a hospital providing subspecialty care should be a full-time, board-certified obstetrician with subspecialty certification in maternal-fetal medicine. Specialized training in critical care obstetrics or some experience in caring for critically ill pregnant women is preferred. The ability for MFM to admit directly to the ICU is highly desirable. The director is responsible for maintaining practice guidelines and, in cooperation with the obstetric medical director, nursing, and hospital administration, is responsible for
developing the operating budget; evaluating and purchasing equipment; planning, developing, and coordinating in-hospital and outreach educational programs; and participating in the evaluation of perinatal care.

2. **Obstetricians**: Board-certified (or active candidate) obstetricians, whose qualifications and appointments have been approved by the appropriate hospital committee, may assume primary responsibility for the hospital care of high-risk patients. However, the institution is responsible for development of guidelines that prescribe circumstances in which the obstetrician will consult the maternal-fetal specialist.

3. Normal deliveries should be attended by a physician or a certified nurse midwife, and a registered nurse.

4. Every delivery should be attended by at least one person whose primary responsibility is for the newborn and who is capable of performing neonatal resuscitation according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program guidelines. Either that person or someone else who is immediately available should have the skills required to perform a complete resuscitation, including endotracheal intubation and administration of medications.

5. Deliveries of high-risk fetuses should be attended by an obstetrician and at least two other persons qualified in neonatal resuscitation whose only responsibility is the neonate. With multiple gestations, each newborn should have his or her own dedicated team of care providers who are capable of performing neonatal resuscitation according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program guidelines.

6. **Anesthesiologists**: Obstetric anesthesia services should be directed by a board-certified anesthesiologist who has experience or subspecialty training in obstetric anesthesia.

7. **Sub-specialty Consultants**: Sub-specialty consultants for obstetric patients should include, at a minimum, neonatologist available for antepartum / intrapartum consultation, hematologist, cardiologist, and other appropriate sub-specialists in internal medicine, such as infectious diseases, and surgery. A geneticist for obstetric and newborn patients should maintain an ongoing service program, either as a member of the active staff of the hospital, or as a consultant whose responsibility for the hospital's genetic program is clearly identifiable.

B. **Nurses**

1. The nurse manager in a maternal-fetal unit should have completed education according to the most recent edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level IV*, for obstetric
nurses, published by the Tennessee Department of Health. A baccalaureate degree is required.

2. In Level IV facilities, staff nurses (R.N.) in obstetrics who are responsible for Level II, Level III, or Level IV care should have completed Level IV education according to the most recent edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level IV*, for obstetric nurses, published by the Tennessee Department of Health. Nurses should maintain institutional unit-specific competencies. In addition, all nurses should be current NRP providers. Nurses should maintain a level of competency in electronic fetal monitoring (EFM) as determined by their institution. It is recommended that all nurses who provide post-anesthesia care to obstetric patients maintain ACLS competency.

3. The Level IV obstetric unit should have at least one obstetric nurse on its full-time staff who is responsible for staff education. This nurse should either be masters’ prepared in a nursing-related field or actively pursuing an advanced degree.

4. Recommended Registered Nurse (R.N.) / Patient Ratios for Perinatal Care (Association of Women’s Health, Obstetric, and Neonatal Nurses *Guidelines for Professional Registered Nurse Staffing for Perinatal Units*, 2010):

<table>
<thead>
<tr>
<th>Ratio</th>
<th>Care Provided</th>
</tr>
</thead>
<tbody>
<tr>
<td>1:2</td>
<td>Patients in labor without complications</td>
</tr>
<tr>
<td>1:1</td>
<td>Patients in second stage of labor</td>
</tr>
<tr>
<td>2:1</td>
<td>Birth. 1 nurse responsible for the mother and 1 nurse whose sole responsibility is the baby</td>
</tr>
<tr>
<td>1:1</td>
<td>Patients with medical or obstetric complications</td>
</tr>
<tr>
<td>1:1</td>
<td>Patients receiving oxytocin during labor</td>
</tr>
<tr>
<td>1:1</td>
<td>Coverage for initiating epidural anesthesia</td>
</tr>
<tr>
<td>1:1</td>
<td>Patients in the immediate postoperative recovery period (at least the first 2 hours after birth)</td>
</tr>
<tr>
<td>1:3</td>
<td>Antepartum and postpartum patients with complications but in stable condition</td>
</tr>
<tr>
<td>1:3</td>
<td>Mother-newborn couplets on the immediate post-operative day (no more than 2 of the mothers should be recovering from cesarean birth)</td>
</tr>
<tr>
<td>1:5-6</td>
<td>Postpartum patients without complications (no more than 2-3 of these patients should be recovering on the immediate post-operative day from cesarean birth)</td>
</tr>
</tbody>
</table>

In-house minimal staffing for care of antepartum and postpartum patients should be adequate to handle possible emergencies. Sufficient staff skilled in obstetrics should be immediately available and free to respond to these emergencies without decreasing the unit staffing below safe levels as described above.
C. **Social Workers**

The services of social workers should be made available by the hospital 24 hours daily. These services should be provided by a staff that is qualified in perinatal social work. This requires that social workers be educated according to the most recent edition of the *Tennessee Perinatal Care System Educational Objectives in Medicine for Perinatal Social Workers*, published by the Tennessee Department of Health.

D. **Case Manager / Discharge Coordinator**

Personnel experienced in dealing with discharge planning and education, follow-up and referral, and home care planning must be available to antepartum, intrapartum, and postpartum unit staff members, patients, and families.

E. **Dietitian / Lactation Consultant**

The staff must include at least one dietitian who has special training in perinatal nutrition and can plan diets that meet the special needs of high risk antepartum and postpartum women. Availability of lactation consultants 7 days a week is recommended to assist with complex breastfeeding issues. 1.9 full-time equivalent lactation consultants are recommended for every 1,000 births based on annual birth volume in Level III (also applies to Level IV) perinatal centers (*Association of Women’s Health, Obstetric, and Neonatal Nurses Guidelines for Professional Registered Nurse Staffing for Perinatal Units*, 2010).
LEVEL IV FACILITIES - NEONATAL

I. INTRODUCTION

Level IV nurseries provide regional NICU services.

Level IV units have Level III capabilities, plus:

- Located within an institution with the capability to provide surgical repair of complex congenital or acquired conditions
- Maintain a full range of pediatric medical subspecialists, pediatric surgical subspecialists, and pediatric anesthesiologists at the site
- Facilitate transport

(American Academy of Pediatrics Levels of Neonatal Care, 2012)

The responsibilities and capabilities that are prescribed for these facilities are solely concerned with the level of patient care. Designation as a Level IV facility does not imply designation as a Regional Perinatal Center. The additional responsibilities of Regional Perinatal Centers are described elsewhere in these Guidelines.

II. SERVICES PROVIDED

A. Educational Services

Educational services should include the following:

1. **Parent Education**: Ongoing perinatal education programs for parents.

2. **Nurses’ Education**: Level IV units are required to provide ongoing educational programs for their nurses that conform to the latest edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level IV*, for neonatal nurses, published by the Tennessee Department of Health. Outreach educational activities are not required.

3. **Physicians’ Education**: Level IV units are required to provide ongoing educational programs for physicians practicing in that institution. Outreach educational activities are not required.

4. All neonatal care providers should maintain both current NRP and S.T.A.B.L.E. provider status. The S.T.A.B.L.E. Cardiac Module is also recommended.
B. Neonatal Care

Level IV facilities accommodate normal infants (unless located in a free-standing children's hospital), moderately ill, and severely ill infants who are either inborn or are transferred from other hospitals. The care of normal neonates should conform to the standards published in the most recent edition of the *Guidelines for Perinatal Care*, jointly published by the American Academy of Pediatrics and the American College of Obstetricians and Gynecologists. The principal commitment of all Level IV facilities is the care of sick neonates in an intensive care unit that is staffed and equipped to treat the most severe and complex neonatal disorders.

1. **Resuscitation**: Provision must be made for resuscitation of infants immediately after birth. Resuscitation capabilities should include assisted ventilation with blended oxygen administered by bag or T-piece resuscitator with mask or endotracheal tube, chest compression, and appropriate intravascular therapy. Refer to the most recent edition of the American Heart Association and American Academy of Pediatrics *Neonatal Resuscitation Program Guidelines* for a complete list of resuscitation equipment and supplies.

2. **Transport from Delivery Room to the Special Care Nursery**: Transport to a special care nursery requires a capacity for uninterrupted support. An appropriately equipped pre-warmed transport incubator, with blended oxygen, should be used for this purpose.

3. **Transitional Care**: Recurrent observation of the neonate should be performed by personnel who can identify and respond to the early manifestations of neonatal disorders.

4. **Care of Sick Neonates**: The care of moderately and severely ill infants entails the following essentials:
   
   a. Continuous cardiorespiratory monitoring.
   b. Serial blood gas determinations and non-invasive blood gas monitoring.
   c. Periodic blood pressure determinations (intra-arterial when necessary).
   d. Portable diagnostic imaging for bedside interpretation.
   e. Availability of electrocardiograms and echocardiograms with rapid interpretation.
   f. Laboratory Services: Clinical laboratory services must be available to fully support clinical neonatal functions.
   g. Fluid and electrolyte management and administration of blood and blood components.
   h. Phototherapy and exchange transfusion.
   i. Administration of parenteral nutrition through peripheral or central vessels.
   j. Provision of appropriate enteral nutrition and lactation support.
5. **Mechanical Ventilatory Support**: The Level IV unit must be qualified to provide mechanical ventilatory support. The essential qualifications are as follows:

   a. Continuous in-house presence of personnel experienced in airway management, endotracheal intubation, and diagnosis and treatment of air leak syndromes.
   b. A staff of nurses (R.N.) and respiratory therapists (R.T.) who are specifically educated in the management of neonatal respiratory disorders.
   c. Blood gas determinations and other data essential to treatment must be available 24 hours daily.
   d. Level IV nurseries should be able to provide a full range of respiratory support, including sustained conventional and/or high frequency ventilation and inhaled nitric oxide.

6. **Diagnostic Imaging**: Perform advanced imaging, with interpretation on an urgent basis, including CT, MRI, and echocardiography.

7. **Laboratory Services**: Clinical laboratory services must be available to fully support clinical neonatal functions.

8. **Blood Bank Services**: Blood bank services must be maintained at all times. An appropriately trained technician should be available in-house 24 hours daily. All blood components must be obtainable on an emergency basis, either on the premises or by pre-arrangement with another facility.

C. **Consultation and Transfer**

1. **Neonatal Transport**:

   a. The Level IV facility that operates a transport service is required to maintain equipment and a trained team of personnel for the transport of newborn patients. The team and equipment must be available at all times. The Level IV facility is responsible for transport of referred infants with its own equipment, or alternatively, with equipment from a commercial source.

   b. The Level IV facility that operates a transport service should originate a protocol that describes procedures, staffing patterns, and equipment for the transport of referred infants. The protocol should conform to the most recent edition of the *Tennessee Perinatal Care System Guidelines on Transportation*, published by the Tennessee Department of Health.

   c. The Level IV facility that operates a transport service is required to maintain records of its activities. (See the most recent edition of the *Tennessee Perinatal Care System Guidelines on Transportation.*
D. Maintenance of Data and Assessment of Quality Measures

A systematic ongoing compilation of data should be maintained to reflect the care of sick patients, in addition to the listing of minimal data that is specified for Level I, Level II, and Level III facilities. All Level IV programs should participate in a state or national continuous quality improvement initiative that includes ongoing data collection and review for benchmarking and evaluation of outcomes. Examples of continuous quality improvement initiatives available in Tennessee are those provided by TIPQC and THA.

III. PERSONNEL: QUALIFICATIONS AND FUNCTIONS

A. Physicians

1. **Director**: The director of the newborn intensive care unit must be a full-time, board-certified pediatrician with subspecialty certification in neonatal-perinatal medicine. The director is responsible for maintaining practice guidelines and, in cooperation with nursing and hospital administration, is responsible for developing the operating budget; evaluating and purchasing equipment; planning, developing, and coordinating in-hospital and outreach educational programs; and participating in the evaluation of perinatal care.

2. **Neonatologists**: The attending physician for sick neonates must be fellowship-trained and board-certified or eligible to take the board certification exam in neonatal-perinatal medicine.

3. **Pediatricians**: A board-certified neonatologist must have primary and ultimate responsibility for infants who receive intensive care. Board-certified pediatricians, whose qualifications and appointments have been approved by the appropriate hospital committee, can care for infants who need more than routine care as long as they are under the supervision of a neonatologist.

4. **In-House Coverage**: In-house physician consultation and coverage should be provided 24 hours per day by a board-certified neonatologist or a board-certified neonatal nurse practitioner. However, when in-house coverage does not include a board-certified neonatologist, he/she must be on-call and available to be on-site within 30 minutes of request.

5. Every delivery should be attended by at least one person whose primary responsibility is for the newborn and who is capable of performing neonatal resuscitation according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program guidelines. Either that person or someone else who is immediately available should have the skills required to perform a complete resuscitation, including endotracheal intubation and administration of medications.
6. Deliveries of high-risk fetuses should be attended by an obstetrician and at least two other persons qualified in neonatal resuscitation whose only responsibility is the neonate. With multiple gestations, each newborn should have his or her own dedicated team of care providers who are capable of performing complete neonatal resuscitation according to the American Heart Association and American Academy of Pediatrics Neonatal Resuscitation Program guidelines.

7. **Anesthesiologists**: Pediatric anesthesia services should be directed by a board-certified anesthesiologist who has a special interest and an expertise in pediatric anesthesia.

8. **Radiologists**: A radiologist must be available on-call at all times.

9. **Sub-specialty Consultants**: A Level IV unit should have pediatric surgical sub-specialists on call and readily available for consultation and continuous patient management.

**B. Nurses**

1. The nurse manager of the Level IV nursery should have completed education according to the most recent edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level IV, Neonatal*, published by the Tennessee Department of Health. A baccalaureate degree is required.

2. Staff nurses (R.N.) must have received courses as outlined in the most recent edition of the *Tennessee Perinatal Care System Educational Objectives for Nurses, Level IV*, for neonatal nurses, published by the Tennessee Department of Health. Nurses should maintain institutional unit-specific competencies. In addition, all nurses should be current NRP and S.T.A.B.L.E. providers.

3. The Level IV nursery should have at least one neonatal nurse on its full-time staff who is responsible for staff education. This nurse should either be masters’ prepared or actively pursuing an advanced degree.

4. Recommended Registered Nurse (R.N.) / Patient Ratios for Newborn Care (Association of Women’s Health, Obstetric, and Neonatal Nurses *Guidelines for Professional Registered Nurse Staffing for Perinatal Units*, 2010):

<table>
<thead>
<tr>
<th>Ratio</th>
<th>Care Provided</th>
</tr>
</thead>
<tbody>
<tr>
<td>1:2-3</td>
<td>Newborns requiring intermediate care</td>
</tr>
<tr>
<td>1:1-2</td>
<td>Newborns requiring intensive care</td>
</tr>
<tr>
<td>1:1</td>
<td>Newborns requiring multisystem support</td>
</tr>
<tr>
<td>1 or more :1</td>
<td>Unstable newborns requiring complex critical care</td>
</tr>
</tbody>
</table>
C. Social Workers

The services of social workers should be made available by the hospital 24 hours daily. These services should be provided by a staff that is qualified in perinatal social work. This requires that social workers be educated according to the most recent edition of the *Tennessee Perinatal Care System Educational Objectives in Medicine for Perinatal Social Workers*, published by the Tennessee Department of Health.

D. Case Manager / Discharge Coordinator

Personnel experienced in dealing with discharge planning and education, follow-up and referral, and home care planning should be available to neonatal intensive care unit staff members and families.

E. Respiratory Therapists

Dedicated respiratory therapists who can provide the assisted ventilation of neonates with cardiopulmonary disease must be available. The nursery’s respiratory therapy director must be a registered respiratory therapist (R.R.T.).

F. Dietitian / Lactation Consultant

The staff must include at least one dietitian who is knowledgeable in the management of parenteral and enteral nutrition of low birthweight and other high-risk infants. Availability of lactation consultants 7 days a week is recommended to assist with complex breastfeeding issues. 1.9 full-time equivalent lactation consultants are recommended for every 1,000 births based on annual birth volume in Level III (also applies to Level IV) perinatal centers (Association of Women’s Health, Obstetric, and Neonatal Nurses *Guidelines for Professional Registered Nurse Staffing for Perinatal Units*, 2010).

G. Pharmacist

A registered pharmacist with expertise in compounding and dispensing medications for neonates must be included on staff. Registered pharmacists with expertise in dispensing neonatal medications, including total parenteral nutrition (TPN), must be available 24 hours a day.

H. Occupational Therapist / Physical Therapist / Speech Therapist

At least one occupational therapist or physical therapist and one speech therapist with neonatal expertise must be included on staff. These disciplines will work collaboratively with the medical and nursing staffs to provide developmentally appropriate care.

I. Neonatal Follow-up Services

Neonatal intensive care unit graduates who are considered high risk and those with birthweights <1500 grams should be enrolled in an organized follow-up
program that tracks and records medical and neurodevelopmental outcomes to allow later analysis.

IV. EQUIPMENT FOR THE INTENSIVE CARE NURSERY

Equipment in the intensive care nursery of a Level IV facility should be adequate for the care of moderately and severely ill infants in accordance with contemporary standards. The quantities of all items of equipment should be sufficient to support the management of the maximum number of infants that are anticipated at times of peak census loads. An in-house Bioengineering Department should have an active program for preventive maintenance and rapid repair.
