

## Marine Sanitation Devices

Marine sanitation device laws apply to boats with installed heads (commodes). Sanitation devices are classified by types. Types I & II treat sewage and then discharge it into the water. A Type III is a holding tank which retains the waste until it is pumped out at a marina or other facility. The following is a summary of the M.S.D. laws:

Discharging untreated sewage into public water is prohibited. It is illegal to use a vessel which is capable of discharging untreated sewage.

Public waters are classified as either **discharge** (capable of accepting treated sewage) or **no discharge** (waste must be retained in a holding tank until properly removed).

Discharge into public waters is restricted to a Type I or II U.S. Coast Guard approved marine sanitation device on those waters classified as **discharge**.

Marinas and docks operating on public water must provide a sewage removal service.
